August 11-12, 2024

NAIC SUMMER NATIONAL MEETING

August 11-12, 2024

TABLE OF CONTENTS

Agenda Item 6

Hear a Presentation on GOES Model Office Testing

MODEL OFFICE GOES FIELD TEST

Impact to VM-20 and VM-21 results

August 11, 2024

A business of Marsh McLennan

CONFIDENTIALITY

Our clients' industries are extremely competitive, and the maintenance of confidentiality with respect to our clients' plans and data is critical. Oliver Wyman rigorously applies internal confidentiality practices to protect the confidentiality of all client information.

Similarly, our industry is very competitive. We view our approaches and insights as proprietary and therefore look to our clients to protect our interests in our proposals, presentations, methodologies, and analytical techniques. Under no circumstances should this material be shared with any third party without the prior written consent of Oliver Wyman.

GOES FIELD TEST SCENARIOS

FIELD TEST SCENARIO SETS

Model office testing was performed on the AIRG scenario set, GOES Field Test scenario sets 1-5 as applicable, and the alternative baseline

Scenario Set	Description	Starting yield curve				
		3-mo	1-yr	10-yr	20-yr	30-yr
AIRG	AIRG as of 12/31/2023	5.40%	4.79%	3.88%	4.20%	4.03%
FT1 GOES Baseline	Conning scenarios as of 12/31/23	*Same as AIRG*				
FT2 Low Rate Shock	Conning scenarios with a starting UST yield curve as of 3/9/20 but with 12/31/23 starting credit spreads	0.33%	0.31%	0.54%	0.87%	0.99%
FT3 Up Rate Shock	Conning Scenarios with a starting UST yield curve as of 10/31/89 but with 12/31/23 starting credit spreads	8.61%	7.76%	7.93%	N/A	7.98%
FT4 Normal Yield Curve	Conning scenarios with a starting UST yield curve as of 12/31/04 but with 12/31/23 starting credit spreads	2.22%	2.75%	4.24%	4.85%	N/A
FT5 Down Equity Shock[1]	Conning scenarios as of 12/31/23 (same as Field Test 1)	*Same as AIRG / baseline*				
FT6 Alternative Baseline	Conning scenarios as of 12/31/23 but with the alternative yield curve fitting proposed by ACLI	*Same as AIRG / baseline*				

1. Scenario Set 5 was not run for VM-20 given it would have no impact to Term or ULSG model office results as there are no equities modeled

COMPARISON OF GOES AND AIRG SCENARIO SETS: INTEREST RATES AND EQUITY RETURNS

Volatility of interest rates across the 10,000 scenario set is increased under the GOES; **median equity growth rates are well aligned** between GOES and AIRG but **tail scenarios are significantly more adverse** under the GOES

Dispersion of average 10-year Treasury rates over 30 years of projection

10-year Treasury rate – AIRG vs GOES[1]

10-year Treasury rate is 3.88% at 12/31/2023

1. Bars represent a 50bps increment
Comparison of gross wealth factor ("GWF") by percentile and year ((GOES FT1 / AIRG) – 1)

	1-yr	5-yr	10-yr	15-yr	20-yr	25-yr	30-yr	50-yr
Min	22%	-43%	-62%	-77%	-81%	-70%	-64%	-47%
1%	-2%	-10%	-20%	-21%	-30%	-24%	-24%	-33%
2.50%	-2%	-4%	-10%	-10%	-14%	-17%	-19%	-21%
5%	-1%	-1%	-4%	-4%	-8%	-12%	-12%	-14%
10%	0%	-1%	-1%	-3%	-3%	-6%	-5%	-10%
25%	1%	2%	3%	2%	1%	0%	-1%	-4%
50%	2%	3%	3%	3%	2%	2%	3%	2%
75%	1%	1%	2%	1%	2%	1%	1%	0%
90%	0%	-1%	-2%	-1%	-3%	-2%	-2%	-2%
95%	-1%	-3%	-2%	-6%	-5%	-6%	-7%	-4%
97.50%	-1%	-5%	-4%	-7%	-10%	-9%	-9%	-6%
99%	-3%	-7%	-9%	-10%	-13%	-11%	-14%	-3%
Max	-2%	-19%	-24%	-15%	-5%	-37%	-38%	82%

GOES scenarios are showing increased interest rate volatility and lower equity growth rates in the tail in comparison to AIRG

6

VM-20 RESULTS

EXECUTIVE SUMMARY: VM-20 MODEL OFFICE GOES IMPACT ANALYSIS

The impact of the enhanced ESG under GOES is amplified for the SERT scenario set due to increased volatility and deterministic shocks; the SR is less impacted given offsetting impacts within the CTE70 scenarios reserve

Analysis performed

Leveraged Term and ULSG model office to produce and analyze the impact of GOES on the calculation of the:
1. Deterministic Reserve ("DR")
2. Stochastic Exclusion Ratio Test ("SERT")
3. Stochastic Reserve ("SR")

Analyzed changes in VM-20 reserves and exclusion test calculations, consistently with field test requirements. A 1,000 scenario subset was picked based on the significance criteria and all results were produced as of the 12/31/2023 valuation date.

Key takeaways

1 **Deterministic applications are more impacted by changes in the ESG**
The SERT scenario set is showing higher rate volatility than under the AIRG, which leads to amplified shocks in the non-baseline scenario and an increase to the DR and SERT results under the GOES

2 **The SERT has a ratio that was determined based on the AIRG scenarios and may need to be revisited**
The 6% SERT ratio was developed under the AIRG and may no longer produce expected results given the higher rate volatility magnifies the impact of the shocks applied and drives the SERT up for the Term and ULSG model office

3 **Applications using the complete set are reasonably close to the AIRG results at the CTE70 level**
The increased rate volatility of the GOES produces a higher CTE98 given only the few extreme scenarios are considered. At the CTE70 level, unlike for VAs there is no CSV flooring at the scenario reserve level under VM-20 and the decrease in reserves for less extreme outcomes mitigates the movement of the SR between the two ESGs.

8

VM-20 MODEL OFFICE DESCRIPTION

Model assumptions and product features were selected based on industry benchmarks to be a simplified representation of products currently offered

Projection model details

- **Term:** 20-year term policies issued in 2018
- **ULSG:** Universal life with shadow design lifetime secondary guarantee issued in 2020
- Time 0 reserves held in cash and reinvested at the start date of projection
- Reinvestment strategy uses 50% A/AA corporate bonds
  - **Term**: 2-year bonds
  - **ULSG**: 10-year bonds

Best estimate assumptions

- Follows industry benchmark assumptions
- Mortality experience is 100% credible with 25 years of sufficient data
- UL crediting rate is dynamic and based on NAER less a spread, varying for each stochastic scenario

Prudent estimate assumptions

- VM-20 prescribed mortality margins based on credibility and sufficient data period
- **Term:** 100% shock lapse after level-term period
- **ULSG:** Minimal lapse when policy maintained in-force by NLG (i.e. CSV = 0)

DETERMINISTIC RESERVE – BASELINE SCENARIO IMPACT

The Deterministic Reserve ("DR") is produced using scenario 12 of the SERT scenario set

Term and ULSG Results (000s)

Scenario Set	Term DR	Change from AIRG	ULSG DR	Change from AIRG
AIRG	108		2,325	
FT1 Baseline	129	**+19%**	2,879	**+24%**
FT6 Alt. Baseline	134	**+24%**	2,765	**+19%**

SERT Scenario #12 (DR)

10-year Treasury rate by year

Legend: AIRG — FT1 - Baseline — FT6 - Alt. Baseline
Commentary

- Per VM-20 Appendix 1 the DR scenario (#12) **shocks Treasury rates for years 1-20** and should be **one standard deviation** from the baseline scenario

- The **volatility of GOES** scenarios result in a significantly **larger downward shock** than under AIRG

- **Long-term rates are higher** in the GOES scenario sets than AIRG

- There is minimal impact to results between the GOES FT1 baseline and FT6 alternative baseline

- **Starting assets are held in cash and reinvested at time 0.** The use of 2-year bonds for Term (10-year bonds for ULSG) allows the analysis to reflect the impact of differences in the yield curve at multiple durations; **more robust Asset-Liability Matching ("ALM") practices would mitigate impacts**

- As a result of the significantly lower rates in earlier durations, GOES baseline scenarios are producing a roughly **20% increase to the DR** for both Term and ULSG

The GOES DR scenario has significantly lower Treasury rates for years 1-20 and results in an increase to the DR for Term and ULSG

10

SERT RESULTS – BASELINE

SERT results across the AIRG and GOES Field Test sensitivity scenarios are summarized in the table below, the passing threshold is 6%

Term and ULSG results (000s)

Scenario Set	Term		ULSG	
	Max reserve (#3 pop down)	SERT ratio	Max reserve (#3 pop down)	SERT ratio
AIRG	95	3.6%	1,625	8.6%
FT1 Baseline	129	6.3%	2,281	19.0%
FT6 Alt. Baseline	136	6.6%	2,240	20.2%

SERT #9 – Baseline vs SERT #3 pop down

10-year Treasury rate by year

Legend: AIRG - #9, FT1 - Baseline #9, AIRG - #3, FT1 - Baseline #3
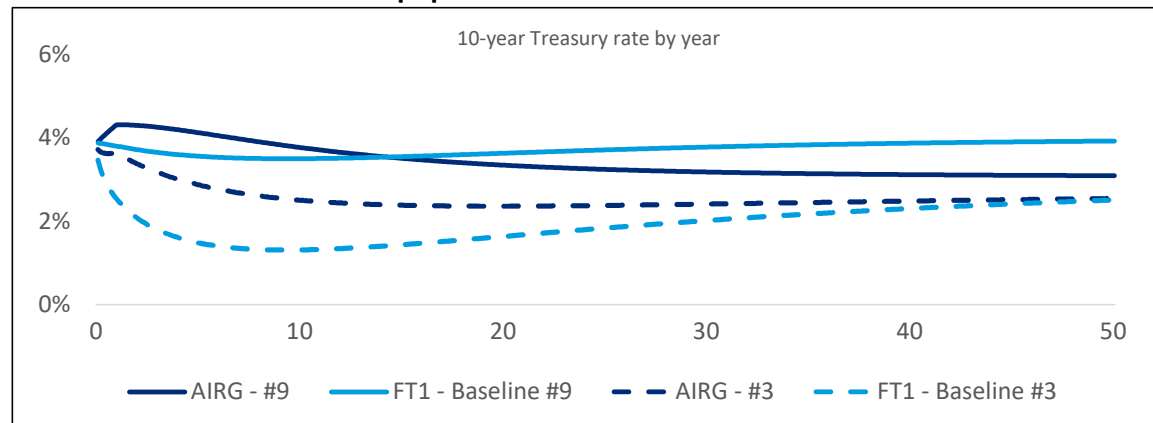

Commentary

- Under GOES, the **baseline SERT scenario (#9)** which is an un-shocked yield curve, is showing slightly **lower Treasury rates in early projection years** and **higher Treasury rates in later years**, due to a higher mean reversion parameter

- Per VM-20 Appendix 1, the **pop down scenario** is described as having an **interest rate shock** selected to maintain the cumulative shock at the 10% level.

- The **wider dispersion** of Treasury rates under GOES results in a **significantly larger shock to Treasury rates**

- The **maximum reserve** calculation for the SERT is **increased significantly** and results in **higher SERT ratios** than under AIRG for the same liability profile

- The determination of the **SERT ratio may need to be reviewed** or the **scenario generation process may need to be further calibrated** to ensure the Exclusion Test's objectives are appropriately met

Similarly to the DR scenario, the SERT baseline (#9) and pop down (#3) scenario sets are showing a wider dispersion of rates than AIRG
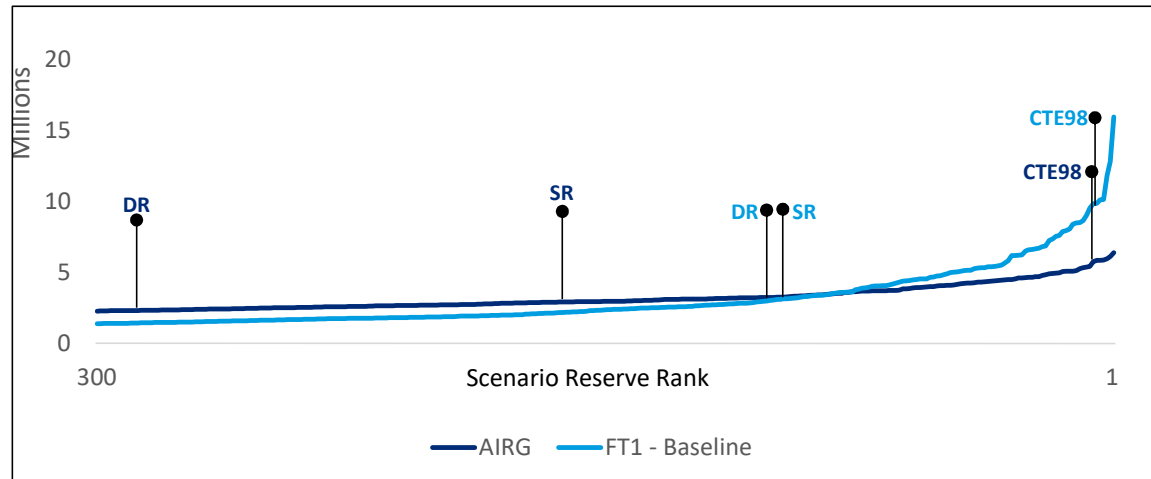

STOCHASTIC RESERVE – BASELINE SCENARIO IMPACT

The Stochastic Reserve ("SR") was produced using a 1,000 scenario subset of the AIRG and GOES scenario sets

ULSG Results (000s)

Scenario Set	DR	Change from AIRG	SR	Change from AIRG	CTE98	Change from AIRG
AIRG	2,325		3,229		5,417	
FT1 Baseline	2,879	+24%	3,167	-2%	9,336	+72%
FT6 Alt. Baseline	2,765	+19%	2,847	-12%	8,247	+52%

CTE70 Scenario Reserves

Commentary

- The GOES scenarios set are producing results that are **largely consistent with AIRG at the CTE70 level**

- The **spread between the "worst" and "best" CTE70 scenario** is much **wider under GOES**, explained by the broader range of yield curve paths

- For nearly **two thirds of the CTE70 scenarios**, the **AIRG is producing higher reserves than under GOES**

- The deep **tail scenarios are significantly more severe under GOES**. In comparison to the AIRG, the CTE98 increases over 70% for FT1 and 50% for FT6

- Given there is **no scenario reserve flooring under VM-20**, The sharp **increase in tail scenario reserves** is partially offset by the small **favorable impact from scenarios below VaR90** where AIRG produced higher reserves than GOES

- Under GOES, the **SR is higher than the DR** by a significantly **smaller margin than under AIRG**, driven by the strengthening of the DR

The impact of the sharp increase in deep tail scenarios is mitigated by the decrease in less adverse scenarios included in the CTE70

12

VM-21 RESULTS

EXECUTIVE SUMMARY: VM-21 MODEL OFFICE GOES IMPACT ANALYSIS

The targeted model office was used to draw insights into field test results and develop a better understanding of how the GOES algorithm impacts projections under a range of starting economic conditions

Analysis performed

Leveraged prior archetype analysis to select 3 key cohorts to analyze under the new field test scenario sets:
1. Mature business / Strong guarantee / At-the-money
2. New business / Strong guarantee / Out-of-the-money
3. New business / Weak guarantee / In-the-money

Produced CTE70 and CTE98 results to analyze changes in VM-21 reserves and capital requirements, consistently with field test requirements. A 1,000 scenario subset was picked based on the significance criteria and all results were produced for the 12/31/2023 valuation date.

Key takeaways

1 *FT1 vs AIRG* **FT1 produces higher reserves than the AIRG:**
Analysis of tail scenario confirmed that accumulated Gross Wealth Factors ("GWF") are lower in the FT1 results than in the AIRG scenarios and interest rates are lower in earlier years, both of which lead to higher CTEs

2 *FT2-5 vs FT1* **Sensitivity scenario sets produced impacts consistent with expectations:**
Lower yield curves lead to higher reserves due to lower reinvestment income, and vice versa; lower equity returns increase reserves due to guarantees becoming more in-the-money

3 *Alternative baseline vs FT1* **Alternative baseline produces higher reserves than FT1:**
The proposed adjustments to the fit of the yield curve produced higher reserves, given that reinvestment rates are tied to the 10-year Treasury rates and longer tenors do not impact reinvestment rates

CTE70 (adjusted) in excess of CSV by scenario set (New / Strong / OTM)
Economic scenarios: AIRG, GOES Scenario Sets 1-5, alternative baseline

14

MODEL COMPONENTS AND FUNCTIONALITY

Component	Description of functionality
Liability modeling	• Liability cash flows for model office comprised of the following product features: — Base variable annuity contract and a variety of GMxB (GLWB, GMDB, GMIB) with typical features and charges • Modeled on a direct basis only (i.e., without reinsurance)
Asset modeling	• Guardrail VM-21 prescribed strategy: 10-year bonds with ratings A and AA consistent with the guardrail prescribed under VM-21
Calculations	• Outer loop cash flows under best estimate assumptions and input deterministic scenarios • Pre-tax asset and liability projections under input stochastic scenarios reflecting all cashflows under prudent best estimate and VM-21 prescribed assumptions • Inforce asset iteration at valuation date under input stochastic scenarios to achieve no GPVAD • Fair value of living benefit riders on annual timesteps to support implicit hedging approach
Assumption sets	• Best estimate • Prudent best estimate • VM-21 standard projection prescribed
Hedging	• Employs the "cost of reinsurance" method (i.e., implicit method) in the best efforts run, option cost is charged at time 0 and rider fees and claims are removed
Reporting	• Stochastic reserve (CTE70 pre-tax under adjusted and best efforts hedge) • Standard projection add-on under CTEPA method (CTE70 under prescribed in excess of SR, subject to CTE70 – CTE65 unfloored buffer) • C3 at 100% RBC (CTE98 pre-tax and subsequent calculations). Note: C3 will be unsmoothed

15

DRIVING CHARACTERISTICS: SPECIFICATIONS

In-force archetypes were created using a model office creation toolkit and varied by driving characteristics. A wide range was used in determining variation in driving characteristics in order to capture a range of impacts to compare against field testing

Characteristic	Variations	Values
GMWB guarantee strength	Weak guarantee	**Rollup rate:** 3% **Income rates:** 4.0% - 5.5% based on attained age
	Strong guarantee	**Rollup rate: 7**% **Income rates:** 5.5% - 7.0% based on attained age
Hedging	Hedged	**Hedge modeling:** Implicit method
	Unhedged	**Hedge modeling:** None
Block maturity	New	**Issue year:** 2022 **Average age:** 66 **Percentage of GMWB contracts taking income:** 20%
	Mature	**Issue year:** 2007 **Average age:** 75 **Percentage of GMWB contracts taking income:** 75%
Moneyness	OTM / ATM / ITEM	**OTM:** Benefit Base is 90%-100% of AV **ATM:** Benefit Base is 100%-110% of AV **ITM:** Benefit Base is 110%-140% of AV
Other	Static inputs	**M/F sex split:** 50/50 **Q/NQ split:** 65/35 **Equity allocation:** 70%

16

IN-FORCE ARCHETYPES: GMWB/GMDB COMBO

16 different GMWB/GMDB combo archetypes were used in the initial model office testing. 3 cohorts outlined below are the focus for this analysis, based on their representativeness of industry results

| Archetype		LB rider	DB rider	Hedging	Guarantee strength	Block maturity	Moneyness
▲	1	Rollup GMWB	ROP GMDB	Implicit	Strong	New	ITM
▲	2	Rollup GMWB	ROP GMDB	Implicit	Strong	New	OTM
●	3	Rollup GMWB	ROP GMDB	Implicit	Strong	Mature	ITM
●	4	Rollup GMWB	ROP GMDB	Implicit	Strong	Mature	ATM
▲	5	Rollup GMWB	ROP GMDB	Implicit	Weak	New	ITM
▲	6	Rollup GMWB	ROP GMDB	Implicit	Weak	New	OTM
●	7	Rollup GMWB	ROP GMDB	Implicit	Weak	Mature	ITM
●	8	Rollup GMWB	ROP GMDB	Implicit	Weak	Mature	ATM
▲	9	Rollup GMWB	ROP GMDB	None	Strong	New	ITM
▲	10	Rollup GMWB	ROP GMDB	None	Strong	New	OTM
⊘	11	Rollup GMWB	ROP GMDB	None	Strong	Mature	ITM
⊘	12	Rollup GMWB	ROP GMDB	None	Strong	Mature	ATM
△	13	Rollup GMWB	ROP GMDB	None	Weak	New	ITM
△	14	Rollup GMWB	ROP GMDB	None	Weak	New	OTM
◎	15	Rollup GMWB	ROP GMDB	None	Weak	Mature	ITM
◎	16	Rollup GMWB	ROP GMDB	None	Weak	Mature	ATM

Focus for this analysis

17

STOCHASTIC RESERVE – BASELINE SCENARIO IMPACT

The Mature / Strong / ATM cohort scenarios reserves for the CTE70 are graphed for AIRG and FT1 under the unfloored adjusted and best effort runs

Unfloored CTE70 adjusted scenario reserve metrics

Scenario Set	CTE70	CTE80	CTE90	CTE95	CTE98
AIRG	93	94	97	99	102
FT1 - Baseline	93	95	99	102	107

Unfloored CTE70 scenario reserves

Commentary

- GOES scenarios are producing **larger adjusted scenario reserves than AIRG for tail scenarios**

- Severity of adverse impact to tail scenarios are the result of **increased volatility to equity returns and Treasury rates under GOES**

  - **Equity returns in tail scenarios are lower** than under the AIRG, leading to increased claims and reduced fees

  - **Treasury rates in tail scenarios are lower than under AIRG and may go negative,** leading to lower investment income and higher discounted claims

  - Deep tail scenarios exhibit low equity returns and Treasury rates

- **CSV flooring at the scenario level has a significant impact under GOES**, preventing impacts from less adverse scenarios from offsetting the increase to tail scenario reserves

- The profile of the underlying inforce may have a significant impact to CTE70 and impact of flooring

Results from the GOES are more adverse than AIRG the further we go in the tail, with a 5% increase to CTE98 adjusted

18

BASELINE SCENARIOS – RESERVES COMPARISON

Comparison of VM-21 reserves in excess of CSV for all three cohorts, outlining the difference between the AIRG, the GOES baseline, and the alternative baseline reserves

VM21 SR and CTE (adjusted) ("Adj") reserves in excess of CSV
CTE70 (adjusted) by archetype (000s)

Archetype	AIRG [A]	GOES FT1 [B]	GOES Alt. Baseline [C]	([B] − [A]) / [A]	([C] − [B]) / [B]
New / Weak / ITM	540	1,223	1,542	126%	26%
New / Strong / OTM	171	693	876	303%	26%
Mature / Strong / ATM	145	509	684	251%	34%

GOES FT1 produces higher reserves than the AIRG as a result of compressed equity returns in the tail and lower Treasury rates in early durations. The alternative baseline produced similar but slightly more adverse results than FT1

19

BASELINE SCENARIOS – SCENARIO ANALYSIS – MATURE / STRONG / ATM COHORT

Comparison of average accumulated gross wealth factors ("GWF") and 10-Year Treasury curve for CTE70 and CTE98 scenarios over 50 years of projection for the Mature / Strong Guarantee / ATM cohort

Mature / Strong Guarantee / ATM Cohort
Average equity return from GOES scenarios is similar to AIRG at the CTE70 and CTE98 levels but more disbursed and adverse in the tail; lower GOES rates in earlier years are producing adverse results despite reverting to a higher mean in later years

VM-20 APPENDIX

DETERMINISTIC RESERVE – SENSITIVITY IMPACT

The DR for Term and ULSG is sensitive to changes in starting economic conditions as a result of the direct impact to reinvestment rates

Term and ULSG Results (000s)

Scenario Set	Term DR	Change from FT1	ULSG DR	Change from FT1
FT1 Baseline	129		2,879	
FT2 Low Yields	190	+47%	4,908	+70%
FT3 High Yields	66	-49%	1,438	-50%
FT4 Normal	145	+13%	2,579	-10%

SERT Scenario #12 (DR)
Commentary

- Sensitivities represent an immediate **upward/downward shock of 300-400bps** to the yield curve

- Starting conditions have a **magnified impact under the model office testing** given **starting assets are held in cash** and immediately reinvested

- **Long-term rates are consistent** across the GOES scenario sets, having largely the same rates in years 35+

- The normal yield curve results in **lower ULSG DR from increase in 10-year rates**, however the **Term DR increases due to the significant decrease to 2-year rates** in comparison to FT1

- Adverse impact of low rates is amplified on the ULSG block where minimum guarantees are met

- Impacts would be **mitigated by a well-matched ALM strategy**

The GOES sensitivity scenarios are producing results consistent with expectations and commensurate with the level of shock from FT1

22

DETAILED SERT RESULTS (1/6)

For the AIRG, the Term SERT is **3.6%** and the ULSG SERT is **8.6%**

SERT Scenario	Term		ULSG	
	Adjusted DR	PV Benefits	Adjusted DR	PV Benefits
1 – Pop up, high equity	17,249	853,419	493,229	5,172,664
2 – Pop up, low equity	17,249	853,419	493,229	5,172,664
3 – Pop down, high equity	95,431	1,032,560	1,625,270	7,021,762

28

STOCHASTIC RESERVE – SENSITIVITY SCENARIO IMPACT

The Stochastic Reserve ("DR") was produced using the 1,000 scenario subset of the GOES low rate and high rate sensitivity scenario sets

ULSG Results (000s)

Scenario Set	DR	SR (CTE70)	Change from FT1	CTE98	Change from FT1
FT1 Baseline	2,879	3,167		9,336	
FT2 Low Yields	4,908	5,036	+59%	10,556	+13%
FT3 High Yields	1,438	1,237	-61%	6,482	-31%
FT1 Baseline (20Yr)	2,229	2,677	-15%	7,897	-15%

CTE70 Scenario Reserves
Commentary

- Under the GOES **baseline and low rate scenario sets**, the **SR is the dominant reserve** but the DR is producing a similar reserve

- Under the **high rate scenario set, the DR is the binding reserve** and some of the CTE70 scenarios produce a reserve of 0, indicating sufficiency of the DR

- The **severity of the deep tail** in the low rate scenario set is **mitigated by the increase in starting assets**

- The impact of shocks to the starting yield curve is significant at the CTE70 level but reduced at the CTE98 level

- Under an **alternate reinvestment strategy comprised of 20-year bonds**, results stayed largely consistent but the **gap between the DR and SR expanded** reflecting the broader dispersion of rates and impact of flooring

The relationship between the DR and SR is largely maintained across the GOES baseline and sensitivity scenario sets

VM-21 APPENDIX

BASELINE SCENARIOS – SCENARIO ANALYSIS – NEW / WEAK / ITM COHORT

Comparison of average accumulated gross wealth factors ("GWF") and 10-Year Treasury curve for CTE70 and CTE98 scenarios over 50 years of projection for the New / Weak Guarantee / ITM cohort

**New / Weak Guarantee / ITM Cohort**
Average equity return from GOES scenarios is similar to AIRG at the CTE70 level, however tail scenarios are more adverse; lower GOES rates in earlier years are producing adverse results despite reverting to a higher mean in later years

31

BASELINE SCENARIOS – SCENARIO ANALYSIS – NEW / STRONG / OTM COHORT

Comparison of average accumulated gross wealth factors ("GWF") and 10-Year Treasury curve for CTE70 and CTE98 scenarios over 50 years of projection for the New / Strong Guarantee / OTM cohort

New / Strong Guarantee / OTM Cohort

CTE70 GWF — Shaded area represents the range between the 10th and 90th percentile of CTE70 scenarios. Legend: Set1, AIRG, FT1 Average, AIRG Average

CTE98 GWF — Tail scenarios are characterized by equity drops in early durations which are more severe under FT1. Legend: FT1 Average, AIRG Average

CTE70 10-Year Treasury — Legend: FT1 Average, AIRG Average

Average equity return from GOES scenarios is similar to AIRG at the CTE70 and CTE98 levels, however tail scenarios for GOES are more adverse; lower GOES rates in earlier years are producing adverse results despite reverting to a higher mean in later years

32

SENSITIVITY SCENARIOS – RESERVES (FT2 – LOW YIELDS)

Comparison of VM-21 reserves in excess of CSV for all three cohorts, outlining the difference between the **GOES baseline**, and the **low starting yield curve** scenario set reserves

VM21 SR and CTE (adjusted) ("Adj") reserves in excess of CSV
CTE70 (adjusted) by archetype (000s)

Archetype	FT1 [A]	FT2 [B]	([B] – [A]) / [A]
New / Weak / ITM	1,223	4,304	251%
New / Strong / OTM	693	2,741	295%
Mature / Strong / ATM	509	2,199	331%

The FT2 scenarios are producing significantly higher reserves than the baseline scenario set due to the compressed yield curve and high prevalence of negative interest rates for sustained periods, implicit hedge results are adversely impacted by the low yields

33

SENSITIVITY SCENARIOS – RESERVES (FT3 – HIGH YIELDS)

Comparison of VM-21 reserves in excess of CSV for all three cohorts, outlining the difference between the **GOES baseline**, and the **high starting yield curve** scenario set reserves

VM21 SR and CTE (adjusted) ("Adj") reserves in excess of CSV

CTE70 (adjusted) by archetype (000s)

Archetype	FT1 [A]	FT3 [B]	([B] – [A]) / [A]
New / Weak / ITM	1,223	121	-91%
New / Strong / OTM	693	50	-93%
Mature / Strong / ATM	509	5	-99%

The FT3 scenarios are producing significantly lower reserves than the baseline scenario set due to the favorable yield curve; we note that a significant portion of scenario reserves are floored at the CSV under this sensitivity

SENSITIVITY SCENARIOS – RESERVES (FT4 – NORMAL CURVE)

Comparison of VM-21 reserves in excess of CSV for all three cohorts, outlining the difference between the **GOES baseline**, and the **non-inverted yield curve** scenario set reserves

VM21 SR and CTE (adjusted) ("Adj") reserves in excess of CSV

CTE70 (adjusted) by archetype (000s)
Archetype	FT1 [A]	FT4 [B]	([B] – [A]) / [A]
New / Weak / ITM	1,223	947	-23%
New / Strong / OTM	693	556	-18%
Mature / Strong / ATM	509	339	-33%

The FT4 scenarios are producing slightly lower reserves than the baseline scenario set due to slightly higher yields from the non-inverted curve; the reinvestments are anchored to 10-year A & AA Corporate Bond returns

35

SENSITIVITY SCENARIOS – RESERVES (FT5 – EQUITY SHOCK)

Comparison of VM-21 reserves in excess of CSV for all three cohorts, outlining the difference between the **GOES baseline**, and the **25% equity shock** scenario set reserves

VM21 SR and CTE (adjusted) ("Adj") reserves in excess of CSV

CTE70 (adjusted) by archetype (000s)

| Archetype	FT1 [A]	FT5 [B]	([B] – [A]) / [A]
New / Weak / ITM	1,223	5,016	310%
New / Strong / OTM	693	2,726	293%
Mature / Strong / ATM	509	2,899	469%

A 25% decrease to the S&P 500 market has a significant impact to results due to the significant immediate increase to the moneyness and decrease in fee base, pushing more scenario reserves beyond the CSV floor

Agenda Item 8

Additional ACLI Resource on the Admissibility of

Negative IMR

Safeguards to ensure that negative IMR remains a sound asset

0

Negative IMR and Asset Adequacy Analysis

- We believe there are adequate safeguards in place to ensure that allowing negative IMR does not cause any unrecognized reserve or capital inadequacies.

- We view "appropriate allocation" as <u>requiring</u> that any IMR that is allowed on a statutory balance sheet be reflected in asset adequacy analysis

- The examples that follow illustrate the effectiveness of the Asset Adequacy Testing (AAT) safeguard in ensuring company solvency even with an admitted negative IMR.
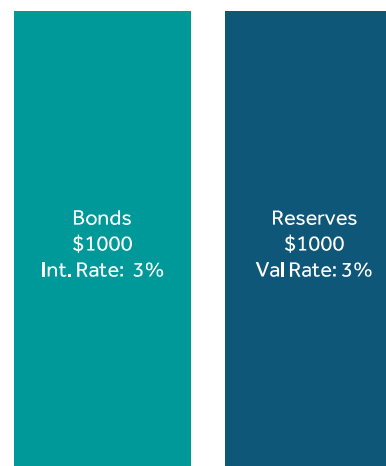

Assumptions:

- **Assets**
  - 10-year Zero-Coupon Bond
  - Par Value: $1,000
  - Interest Rate: 3%,
- **Liabilities**
  - 10-year 3% endowment maturing for 1,344
    - Cashflow matched with current assets
  - Formulaic reserves: $1,000
  - Valuation Rate: 3%,
- **Assume no AAT deficiency prior to sale of assets**

Bonds
$1000
Int. Rate: 3%

Reserves
$1000
Val Rate: 3%

1

Balance Sheet, Income Statement View

Portfolio Balance Sheet	12/31/22	12/31/32	
Assets			
Bonds	1,000	1,344	1
Total Assets	1,000	1,344	
Liabilities			
Policy Reserves	1,000	1,344	2
AAT Reserves	0	0	
IMR Liability	0	0	
Total Liabilities	1,000	1,344	

| Portfolio Income Statement	12/31/22 – 12/31/32	
Income		
Net Investment Income before IMR	344	1
IMR Amortization	0	
Benefits and Expenses		
Benefits	0	
Addition to Reserves	344	2
Net Income (loss)	0	

1   10-year zero coupon bond with 3% interest rate would earn $344 in investment income.

2   Policy reserves with valuation rate of 3% would increase by $344 over ten years until maturity.

Asset Adequacy Analysis[1] is an effective safeguard in all rate environments

1 Formulaic reserves are unchanged at $1,000. There are no surrenders in this scenario.

2 Invested assets that are yielding a return are reduced by the amount of negative IMR that is admitted into statutory accounting.

3 Original bonds of $1,000 at 3% are sold at a capital loss and the proceeds are reinvested at a higher rate (e.g. 4%). Theoretically, the IMR plus the higher yield assets should recreated the original 3% assets keeping the AAT outcome the same.

4 If rates were higher at the time of the asset sale, a larger IMR would be generated which would further reduce the amount of investable assets reflected in AAT, but the reinvested assets would have a higher yield to preserve the AAT outcome.

Modest Increase in Rates (4%)

IMR $92

2

3

Bonds $908 Int. Rate: 4%

Reserves $1000 Val Rate: 3%

1

Large Increase in Rates (6%)

IMR $250

4

Bonds $750 Int. Rate: 6%

Reserves $1000 Val Rate: 3%

	At Issue	Rates move to new level	
Interest Rates	3%	4%	6%
PV(Assets) at time = 0	$1,000	$908	$750
Liability CF at Maturity (in 10 years)	$1,344	$1,344	$1,344
Asset CF at Maturity (in 10 years)	$1,344	$1,344	$1,344
Reserve Inadequacy at time = 0	$0	$0	$0
IMR	$0	-$92	-$250

AAT is an effective safeguard in ensuring that the admitted IMR can be supported by margins of the inforce block.

In this example, there should be no impact to surplus at the higher interest rates.

3

1. Asset Adequacy Analysis starts with **assets = liabilities**

## Balance Sheet, Income Statement View (Rates at 4% on 12/31/22)

Portfolio Balance Sheet	12/31/22 Before Asset Sale	12/31/22 After Asset Sale	12/31/32
Assets			
Bonds	1,000	908	1,344 ①
Total Assets	1,000	908	1,344
Liabilities			
Policy Reserves	1,000	1,000	1,344
AAT Reserves	0	0 ③	0
IMR Liability	0	(92) ②	0
Total Liabilities	1,000	908	1,344

Portfolio Income Statement	12/31/22 – 12/31/32
Income	
Net Investment Income before IMR	436 ①
IMR Amortization	(92) ②
Benefits and Expenses	
Benefits	0
Addition to Reserves	344
Net Income (loss)	**0**

① Original bonds of $1,000 earning 3% are sold at a capital loss and the proceeds are reinvested at a higher rate of 4%. New bonds would earn cumulative investment income of $436 over ten years.

② Capital losses of $92 is transferred into negative IMR liability which is amortized over ten years. This example assumes negative IMR is an admitted asset.

③ No reserve inadequacy confirmed in asset adequacy analysis. The assets including negative IMR are sufficient to cover the liabilities.

Asset Adequacy Analysis[1] combined with surrender activity

- When assets are sold to fund excess withdrawals (no reinvestment), the negative IMR generated can be tested through AAT to ensure the IMR combined with the remaining, unsold assets can support the remaining liabilities.

- If the IMR cannot be supported (i.e. AAT fails), then the losses will be reflected in surplus.

More assets are sold than reserves due to the decrease in market value of assets vs liabilities

Sold Assets	Surrenders
BV: $551	BV: $500
MV: $500	MV: $500

Bonds
$1,000
Int. Rate: 3%

Reserves
$1000
Val Rate: 3%

Elevated withdrawals

after rates increase to 4%.

IMR $51

AAT Reserve, $51

Bonds
$449
Int. Rate: 3%

Reserves[1]
$500
Val Rate: 3%

	At Issue	Rates move to new level combined with 50% surrender
Interest Rates	3%	4%
PV(Assets) at time = 0	$1,000	$449
Liability CF at Maturity (in 10 years)	$1,344	$672
Asset CF at Maturity (in 10 years)	$1,344	$603
Reserve Inadequacy at time = 0	$0	$51
IMR	$0	-$51

In this example, rising rates combined with surrender activity causes AAT to fail.

Surplus is reduced by $51.

5

1. Asset Adequacy Analysis starts with **assets = liabilities**

Balance Sheet, Income Statement View (Rates at 4% on 12/31/22)

Addition to AAT Reserves on 12/31/22	51 ④
Net Income (loss)	**(51)**

Balance Sheet, Income Statement View

1 Original bonds of $551 earning 3% are sold at a capital loss to fund excess policy withdrawals (not available to be reinvested at 4%). Remaining bonds of $449 continue to earn 3% for ten years.

2 Excess policy surrenders of $500 after interest rates increase to 4%. Remaining liability of $500 at valuation rate of 3% is being supported by bonds of $449 that continue to earn 3%.

3 Capital losses of $51 are transferred into negative IMR liability and is amortized over ten years. This example assumes the IMR is an admitted asset.

4 Asset adequacy analysis starts with assets of $500 ($449 of bonds and $51 of negative IMR) equal to liabilities of $500, but it reveals that additional assets are needed to fund a deficiency of $68 in ten years. Assets are transferred from surplus to support the additional AAT reserves that are established so the company takes a surplus hit of $51. The additional assets of $51 (now in the portfolio) are assumed to earn 3% in this example.

5 Total assets of $500 ($449 of the original bonds plus the $51 added due to AAT) earn investment income at a 3% rate (cumulative income of $172 over ten years).

6 Policy reserves increase to $672 by maturity (increase of $172) while AAT reserves decrease to $0 by maturity (decrease of $51), which results in a net increase in reserves of $121. No further deficiencies after taking the upfront hit to surplus in 12/31/22.

Agenda Item 13

Hear an Update from the

Academy Life Practice Council

Academy Life Practice Council Update

Life Actuarial Task Force (LATF) Meeting

August 12, 2024

About the Academy

2

- The American Academy of Actuaries is a 20,000-member professional association whose mission is to serve the public and the U.S. actuarial profession. For more than 50 years, the Academy has assisted public policymakers on all levels by providing leadership, objective expertise, and actuarial advice on risk and financial security issues.

- The Academy also sets qualification, practice, and professionalism standards for actuaries in the United States.
