

INDUSTRY MEANS AND MEDIAN

The following tables present simple mean and median statistics for the individual company ratio results shown in the remaining sections. These statistics were calculated with and without minimum and maximum values. The simple mean is equal to the sum of the individual company ratio values divided by the number of companies. The median value represents the midpoint of the distribution of individual ratio results, or a value such that about half of the companies have a ratio result below that number and about half have a result greater than that number. For some ratios, more than half of the companies have a zero value. In these instances, the median value is zero.

A limitation of these statistical calculations is the effect of default and extreme values. As explained in the discussion of ratio calculations, results are limited to minimum and maximum values. Also, a number of small and new companies may have ratio results that tend toward either extreme. These conditions distort the statistical calculations, particularly the mean, and cause some of the statistics to diverge from what would be considered normal or the average industry experience. Statistical calculations with minimum and maximum values excluded appear to be more realistic for some ratios, but they still may not reflect the actual experience of the industry.

RATIO RESULTS

The following footnote denoted with a C in the Property and Casualty Ratio Results sections applies to multiple peril crop insurers.

The company writes multiple peril crop insurance (MPCI) which is reinsured in part by the United States Department of Agriculture. Reporting the MPCI line of business as prescribed by the NAIC Accounting Practices and Procedures Manual (SSAP NO.78) may result in ratios with unusual values. The NAIC Crop Insurance Handbook should be consulted for information on the Federal Crop Insurance program to aid in determining the impact on these ratios.
