Certain contracts issued under a master group contract require individual risk selection in order to qualify for issuance of the group insurance certificate; the certificates have similar acquisition approaches, provisions, certificate-holder rights, pricing, and risk classification; and they are managed in a similar manner as individual ordinary life insurance contracts. These individual certificates should follow the same reserve requirements as other individual life contracts of the same product type. Therefore, a change is needed within the Valuation Manual to bring these individual certificates into scope of VM-20.

Six changes are recommended:

1) Within the Reserve Requirements section (Section II), change the minimum reserve requirements to also apply to group life contracts which, other than the difference between issuing a policy and issuing a group certificate, have the same or mostly similar contract provisions, risk selection process, and underwriting as individual ordinary life contracts (Section II, subsection 1.D);

2) Within the Reserve Requirements section (Section II), add a transition period for individual group certificates issued on or before 1/1/2024 (Section II, subsections 1.F.1 and 1.F.2);

3) Within the Reserve Requirements section (Section II), add language and guidance note to subsection 1.G and the corresponding footnote to include premiums from group life contracts which have individual certificates that were issued using individual risk selection processes (Section II, subsection 1.G.1, footnote, and guidance note) and to clarify the Calculation for Exemption (Section II, subsection 1.G.2). Comment notes need to refer to NAIC Blanks (E) Working Group to update the PBR Supplement;

4) Add new paragraph, VM-20 Section 1.B (and reformat to make current paragraph Section 1.A) to clarify group life certificates issued using individual risk selection processes, including a definition and requirements to be met, are subject to the requirements of VM-20;

5) Add guidance note after first sentence in VM-20 Section 2.A.1 that group life certificates that meet the definition for individual risk selection process use the same VM-20 Reserving Categories as defined in Section 2;

6) Draft referral to the NAIC Blanks (E) Working Group to revise the VM-20 Reserves Supplement, Part 2 to report premiums for total Group Life and Group Life with certificates subjected to an individual risk selection process and which meet all of the conditions as defined in VM-20 Section 1.B separately.
II. Reserve Requirements

This section provides the minimum reserve requirements by type of product, as set forth in the seven subsections below, as follows:

(1) Life Insurance Products
(2) Annuity Products
(3) Deposit-Type Contracts
(4) Health Insurance Products
(5) Credit Life and Disability Products
(6) Riders and Supplemental Benefits
(7) Claim Reserves

All reserve requirements provided by this section relate to business issued on or after the operative date of the Valuation Manual. All reserves must be developed in a manner consistent with the requirements and concepts stated in the Overview of Reserve Concepts in Section I of the Valuation Manual.

Guidance Note: The terms “policies” and “contracts” are used interchangeably.

Subsection 1: Life Insurance Products

A. This subsection establishes reserve requirements for all contracts issued on and after the operative date of the Valuation Manual that are classified as life contracts as defined in SSAP No. 50 in the AP&P Manual, with the exception of annuity contracts and credit life contracts. Minimum reserve requirements for annuity contracts and credit life contracts are provided below in subsection 2 and subsection 5, respectively.

B. Minimum reserve requirements for variable and nonvariable individual life contracts—including guaranteed issue life contracts, preneed life contracts, industrial life contracts, and policies of companies exempt pursuant to the life PBR exemption in paragraph D below—are provided in VM-20, Requirements for Principle-Based Reserves for Life Products, except for election of the transition period in paragraph C below. For this purpose, joint life policies are considered individual life.

C. Minimum reserve requirements of VM-20 are considered principle-based valuation requirements for purposes of the Valuation Manual.

D. Minimum reserve requirements for individual certificates under group life contracts (regardless of the issue date of the master group life contract) which meet all the requirements in VM-20 Section 1.B are provided by VM-20, except for election of the transition period in subsection 1.F.1 below.

E. Minimum reserve requirements for life contracts not subject to VM-20 are those pursuant to applicable requirements in VM-A and VM-C. For guaranteed issue life contracts issued after Dec. 31, 2018, mortality tables are defined in VM Appendix M, Mortality Tables (VM-M), and the same table shall be used for reserve requirements as is used for minimum nonforfeiture requirements as defined in VM-02, Minimum Nonforfeiture Mortality and Interest.
F. A company may elect to establish minimum reserves pursuant to applicable requirements in VM-A and VM-C for:

1. Business described in subsection 1.D above and issued on or after the operative date of the Valuation Manual and prior to 1/1/2024.

2. Business not described subsection 1.D otherwise subject to VM-20 requirements and issued during the first three years following the operative date of the Valuation Manual.

A company electing to establish reserves using the requirements of VM-A and VM-C may elect to use the 2017 Commissioners’ Standard Ordinary (CSO) Tables as the mortality standard following the conditions outlined in VM-20 Section 3. If a company during the three years elects to apply VM-20 to a block of such business, then a company must continue to apply the requirements of VM-20 for future issues of this business.

G. Life PBR Exemption

1. A company meeting the at least one of the conditions in Dsubsection 1.G.2 below may file a statement of exemption for individual ordinary life insurance policies and certificates, except for policies in Dsubsection 1.G.3 below, issued directly or assumed during the current calendar year, that would otherwise be subject to VM-20. If a company has no business issued directly or assumed during the current calendar year that would otherwise be subject to VM-20, a statement of exemption is not required. For a filed statement of exemption, the statement must be filed with the domiciliary commissioner prior to July 1 of that year certifying that at least one of the two conditions in Dsubsection 1.G.2 was met and the statement of exemption must also be included with the NAIC filing for the second quarter of that year.

The domiciliary commissioner may reject such statement prior to September 1 and require the company to follow the requirements of VM-20 for the ordinary life policies covered by the statement.

If a filed statement of exemption is not rejected by the domiciliary commissioner, the filing of subsequent statements of exemption is not required as long as the company continues to qualify for the exemption; rather, ongoing statements of exemption for each new calendar year will be deemed to not be rejected unless: 1) the company does not meet either condition in Dsubsection 1.G.2 below, 2) the policies contain those in Dsubsection 1.G.3 below, or 3) the domiciliary commissioner contacts the company prior to Sept. 1 and notifies them that the statement of exemption is rejected. If any of these three events occur, then the statement of exemption for the current calendar year is rejected and a new statement of exemption must be filed and not rejected in order for the company to exempt additional policies. In the case of an ongoing statement of exemption, rather than include a statement of exemption with the NAIC filing for the second quarter of that year, the company should enter “SEE EXPLANATION” in response to the Life PBR Exemption supplemental interrogatory and provide as an explanation that the company is utilizing an ongoing statement of exemption.

2. Condition for Exemption:

- The company has less than $300 million of ordinary life exemption premiums, and if the company is a member of an NAIC group of life insurers, which includes other life insurance companies, the group has combined ordinary life exemption premiums of less than $600 million, or

The only new policies that would otherwise be subject to VM-20 being issued or assumed by the company are due to election of policy benefits or features from existing policies valued under VM-A and VM-C and the company was exempted from, or otherwise not subject to, the requirements of VM-20 in the prior year.

Exemption premium is determined as follows:
a. The amount reported in the prior calendar year life/health annual statement, Exhibit 1, Part 1, Column 3 (“Ordinary Life Insurance”), line 20.1; plus
b. The portion of the amount in the prior calendar year life/health annual statement, Exhibit 1, Part 1, Column 3 (“Ordinary Life Insurance”), line 20.2 assumed from unaffiliated companies; minus
c. Amounts included in either (a) or (b) that are associated with guaranteed issue insurance policies and/or preneed life insurance policies; minus
d. Amounts included in either (a) or (b) that represent transfers of reserves in force as of the effective date of a reinsurance assumed transaction; plus
e. Amounts of premium for individual life certificates issued under a group life certificate which meet the conditions defined in VM-20, Section 1.B, and that are not included in either (a) or (b).

Guidance Note:
(i) Definitions of preneed and guaranteed issue insurance policy are in VM-01.
(ii) For statements of exemption filed for calendar year 2022 and beyond, the amount in subsection 2.e was reported in the prior calendar year life/health annual statement, VM-20 Reserve Supplement, Part 2, if applicable.

3. Policies Excluded from the Life PBR Exemption:
   a. Universal life with secondary guarantee (ULSG) policies, or policies – other than ULSG – that contain a rider with a secondary guarantee, in which the secondary guarantee does not meet the VM-01 definition of a “non-material secondary guarantee.”

4. Each exemption, or lack of an exemption, outlined in D. subsection 1.G.1 – D. subsection 1.G.3 above applies only to policies issued or assumed in the current year, and it applies to all future valuation dates for those policies. However, if policies did not qualify for the Life PBR Exemption during the year of issue but would have qualified for the Life PBR Exemption if the current Valuation Manual requirements had been in effect during the year of issue, then the domiciliary commissioner may allow an exemption for such policies. The minimum reserve requirements for the ordinary life policies, including individual certificates under group life contracts which meet all the requirements in VM-20 Section 1.B, subject to the exemption are those pursuant to applicable methods required in VM-A and VM-C using the mortality as defined in VM-20 Section 3.C.1 and VM-M Section 1.H.

VM Change 4 – VM-20: Requirements for Principle-Based Reserves for Life Products

VM-20: Requirements for Principles-Based Reserves for Life Products

Section 1: Purpose

A. These requirements establish the minimum reserve valuation standard for individual life insurance policies issued on or after the operative date of the Valuation Manual and subject to a principle-based valuation with an NPR floor under Model #820. These requirements constitute the Commissioners Reserve Valuation Method (CRVM) for policies of individual life insurance.
B. Individual life certificates under a group life contract shall be subject to the requirements of VM-20 if all of the following are met. These requirements constitute the Commissioners Reserve Valuation Method (CRVM) for such certificates.

1. An individual risk selection process, defined as follows, is used to obtain group life insurance coverage;

An individual risk selection process is one that is based on characteristics of the insured(s) beyond sex, gender, age, tobacco usage, and membership in a particular group. This may include, but is not limited to, completion of an application (beyond acknowledgement of membership to the group, sex, gender and age), questionnaire(s), online health history or tele-interview to obtain non-medical and medical or health history information, prescription history information, avocations, usage of tobacco, family history, or submission of fluids such as blood, Home Office Specimens (HOS), or oral fluid. The resulting risk classification is determined based on the characteristics of the individual insured(s) rather than the group, if any, of which it is a member (e.g., employer, affinity, etc.). The individual certificate holder is charged a premium rate based solely on the individual risk selection process and not on membership in a specific group.

2. The individual certificates utilize premiums or cost of insurance schedules and charges based on the individual applicant’s issue age, duration from underwriting, coverage amount and risk classification and there is a stated or implied schedule of maximum gross premiums or net cash surrender value required in order to continue coverage in force for a period in excess of one year;

Guidance Note: Coverage amount does not imply a requirement for banding of premiums or charges but rather rates or charges that are multiplied by number of units of coverage of face amount (or net amount at risk) per $1,000 to obtain the actual premium or charge.

3. The group master contract is designed, priced, solicited, and managed similar to individual ordinary life insurance policies rather than specific to the group as a whole;

4. The individual certificates have similar acquisition approaches, provisions, certificate-holder rights, pricing, and risk classification to individual ordinary life insurance contracts.

5. The individual certificates are issued on or after the operative date of the Valuation Manual except election of the transition period in Section 2, subsection 1.F.1.
VM Change 5 - VM-20: Requirements for Principle-Based Reserves for Life Products

Section 2: Minimum Reserve

A. All policies subject to these requirements shall be included in one of the VM-20 Reserving Categories, as specified in Section 2.A.1, Section 2.A.2 and Section 2.A.3 below.

Guidance Note: Since group insurance subject to an individual risk selection process and meeting all the requirements in Section 1.B is subject to VM-20 requirements, Section 2.A shall apply—meaning that any such contracts will be included in one of the VM-20 Reserving Categories defined by Section 2.A.1, Section 2.A.2, and 2.A.3. All requirements in VM-31 which apply to a VM-20 Reserving Category shall apply to any group insurance subject to individual risk selection that has been included in that VM-20 Reserving Category.

The company may elect to exclude one or more groups of policies from the stochastic reserve calculation and/or the deterministic reserve calculation. When excluding a group of policies from a reserve calculation, the company must document that the applicable exclusion test defined in Section 6 is passed for that group of policies. The minimum reserve for each VM-20 Reserving Category is defined by Section 2.A.1, Section 2.A.2 and Section 2.A.3, and the total minimum reserve equals the sum of the Section 2.A.1, Section 2.A.2 and Section 2.A.3 results below, defined as:
VM Change 6 – VM-20 Reserves Supplement, Part 2: Life PBR Exemption

Refer to NAIC Blanks (E) Working Group, request for modification to the supplemental report for the Life PBR Exemption, to show the premiums for group life that utilized an individual risk selection process and meets all of the requirements in VM-20 Section 1.B. as these premiums are currently grouped together with other group insurance in Exhibit 1. As there are other instances where the ordinary life premiums are not included in the determination of the Life PBR Exemption (e.g., for guaranteed issue policies), it may be useful to request addition of the breakdown of premiums used to determine the exemption.

Possible insertion between questions 1 and 2 for disclosure of premiums used in the determination of eligibility for the Life PBR exemption, split by ordinary life and group subject to an individual risk selection process and meeting all of the requirements in VM-20 Section 1.B.
June 3, 2021

Mr. Mike Boerner  
Chair, Life Actuarial Task Force  
National Association of Insurance Commissioners

Re: APF 2021-07

Dear Mike:

In the event that LATF decides to move forward with APF 2021-07, California wishes to suggest a few minor edits, which we would characterize as friendly amendments. See attached for details.

Sincerely,

[Signature]

Ben Bock, FSA, MAAA  
Senior Life Actuary  
California Department of Insurance

CC: Reggie Mazyck, NAIC
Friendly Amendment Suggestions for APF 2021-07

California has 5 suggestions. The first four relate directly to APF 2021-07 itself and the other is an idea for improving the “flow” of this part of the VM “while we are at it”.

We also agree with Craig Chupp that VM-20 Section 3.B.1.b in the APF should have been labeled 3.B.1.d.

Our wording suggestions below are yellow highlighted.

Suggestion #1 – By combining 3.B.5 and 3.B.6 into one section, that section (new 3.B.5) now has two different valuation net premiums being defined within it. Therefore the reference to the 3.B.5 valuation net premium that occurs in Section 2.A.2.c ought to clarified.

VM-20 Section 2.A.2.c

c. The due and deferred premium asset, if any, shall be based on the valuation net premiums computed in accordance with Section 3.B.5.d, for the base policy, determined without regard to any NPR floor amount from Section 3.D.2.

Suggestion #2 – In the 2021 Valuation Manual, in VM-20, Section 3.B.5 and 3.B.6 use different valuation interest rates. This fact is reflected clearly in the wording of the introductions to VM-20 Sections 3.C.2.a and 3.C.2.b. The APF as proposed diminishes this clarity. Accordingly we suggest:

VM-20 Section 3.C.2.a

a. For NPR amounts calculated according to Section 3.B.5.d:

VM-20 Section 3.C.2.b

b. For NPR amounts calculated according to Section 3.B.4 or Section 3.B.5.c.  

Deleted: 6
Suggestion #3 – Similarly, the current Section 3.B.5 and 3.B.6 use different lapse rates. This fact is reflected clearly in the wording of the introductions to VM-20 Sections 3.C.3.a and 3.C.3.c. of the 2021 Valuation Manual. The distinction is not as clear any more in the APF as currently worded. Accordingly we suggest:

VM-20 Section 3.C.3.a

a. For NPR amounts calculated according to Section 3.B.5.d, the lapse rates used shall be 0% per year during the premium paying period and 0% per year thereafter.

VM-20 Section 3.C.3.c

c. For NPR amounts calculated according to Section 3.B.5.c, the lapse rate, \( L_{x+t} \), for an insured age \( x \) at issue for all durations subsequent to the valuation date shall be determined as follows:

Suggestion #4 – A Section reference was not updated in the logic for computing \( E_{x+t} \) (however, this change would be trumped by Suggestion #5 below if Suggestion #5 is adopted):

VM-20 (new) Section 3.B.5.d.ii

ii. Using the level gross premium from Section 3.B.5.d.i, determine the value of the expense allowance components for the policy at issue as \( x_1 \), \( y_{2-5} \), and \( z_1 \) defined below:

\[
\begin{align*}
  x_1 &= \text{a first-year expense equal to the level gross premium at issue} \\
  y_{2-5} &= \text{an expense equal to 10\% of the level gross premium and applied in each year from the second through fifth policy year} \\
  z_1 &= \text{a first-year expense of $2.50 per $1,000 of insurance issued}
\end{align*}
\]

The expense allowance shall be amortized over the period during which premiums are permitted to be paid. \( E_{x+t} \), the expense allowance balance, as of the end of policy year \( t \), shall be calculated as follows:

\[
E_{x+t} = \begin{cases} 
  VNP&R & \text{for } t < s \\
  0 & \text{for } t \geq s
\end{cases}
\]

Where:

\( t = 1,2,... \) (number of completed years since issue)

\[
VNP&R = \text{Valuation Net Premium Ratio from 3.B.5.e.d.iii}
\]
Suggestion #5 – In computing $Ex+t$, the steps shown involve using the value of VNPR prior to the step in which VNPR is calculated. It would seem more logical to place the calculation of VNPR prior to the $Ex+t$ calculation. This occurs in two different places. Thus we suggest:

VM-20 (new) Section 3.B.5.c.i.

i. As of the policy issue date:

1. Determine the level gross premium at issue, assuming payments are made each year for which premiums are permitted to be paid, such period defined as $v$ years in this subsection, that would keep the policy in force to the end of year $n$, based on policy provisions, including the secondary guarantee provisions, such as mortality, interest and expenses. In no event shall $v$ be greater than $n$ for purposes of the NPR calculated in this subsection.

2. Determine the annual valuation net premiums at issue as that uniform percentage (the valuation net premium ratio) of the respective gross premiums such that at issue the actuarial present value of future valuation net premiums over the $n$-year period shall equal the actuarial present value of future benefits over the $n$-year period. The valuation net premium ratio determined shall not change for the policy.

3. Using the level gross premium from Section 3.B.5.c.i.1 above, determine the value of the expense allowance components for the policy at issue as $x_1$, $y_{2-5}$ and $z_2$ defined below.

\[ x_1 = \text{a first-year expense equal to the level gross premium at issue} \]

\[ y_{2-5} = \text{an expense equal to 10\% of the level gross premium and applied in each year from the second through fifth policy year} \]

\[ z_1 = \text{a first-year expense of $2.50 per $1,000 of insurance issued} \]

The expense allowance shall be amortized over the span of years in the secondary guarantee period during which premiums are permitted to be paid. $Ex+t$, the expense allowance balance as of the end of the policy year $t$, shall be computed as follows:

\[
E_{x+t} = VNPR \cdot \frac{x_1 + y_{2-5} + z_1}{2} + \frac{y_{2-5} \cdot C_{x+t}}{2}
\]

for $t < v$

\[
E_{x+t} = 0
\]

for $t \geq v$

[Deleted: 6]
Where:

\[ j = 1, 2, \ldots \text{ (number of completed years since issue)} \]

\[ VNPR = \text{Valuation Net Premium Ratio from 3.B.5.c.i.3.2 above} \]

\[ C_{x \uparrow t} = 0 \quad \text{when } t = 1 \]

\[ * = \frac{\sum_{w=1}^{t-1} (1/\bar{a}_{x+w-w})}{2 \leq t \leq 5} \]

\[ * = C_{x \uparrow 5} \quad \text{when } t > 5 \]

3. Determine the annual valuation net premiums at issue as that uniform percentage (the valuation net premium ratio) of the respective gross premiums such that at issue the actuarial present value of future valuation net premiums over the n-year period shall equal the actuarial present value of future benefits over the n-year period. The valuation net premium ratio determined shall not change for the policy.

VM-20 (new) Section 3.B.5.d

d. A reserve amount for the policy shall be calculated assuming the secondary guarantee is not in effect. The reserve amount shall be determined by the policy features and guarantees of the policy without considering any secondary guarantee provisions as follows:

i. Determine the level gross premium at issue, assuming payments are made each year for which premiums are permitted to be paid, such period defined as “s” in this subsection, that would keep the policy in force for the entire period coverage is to be provided based on the policy guarantees of mortality, interest and expenses.

ii. Determine the annual valuation net premiums as that uniform percentage (the valuation net premium ratio) of the respective gross premiums, such that at issue the actuarial present value of future valuation net premiums shall equal the actuarial present value of future benefits.

iii. Using the level gross premium from Section 3.B.5.d.i, determine the value of the expense allowance components for the policy at issue as \( x_1, y_{2-5}, \) and \( z_1 \) defined below.

\( x_1 = \) a first-year expense equal to the level gross premium at issue

\( y_{2-5} = \) an expense equal to 10% of the level gross premium and applied in each year from the second through fifth policy year

\( z_1 = \) a first-year expense of $2.50 per $1,000 of insurance issued

[Type here]
The expense allowance shall be amortized over the period during which premiums are permitted to be paid. \( E_{x+t} \), the expense allowance balance, as of the end of policy year \( t \), shall be calculated as follows:

\[
E_{x+t} = VNP_{\cdot} \cdot \bar{a}_{x+t, t-1} \left[ (r_1 + z_1) / \bar{a}_{x, s} + y_{2-s} \cdot C_{x+t} \right]
\]

for \( t < s \)

\[
= 0
\]

for \( t \geq s \)

Where:

\( t = 1, 2, \ldots \) (number of completed years since issue)

\( VNP_{\cdot} = \text{Valuation Net Premium Ratio from 3. B. 5. \textit{ed.ii above}} \)

\[
C_{x+t} = \begin{cases} 
0 & \text{when } t = 1 \\
\sum_{w=1}^{t-1} \left( 1 / \bar{a}_{x+w, t-w} \right) & \text{when } 2 \leq t \leq 5 \\
C_{x+5} & \text{when } t > 5
\end{cases}
\]

iii. Determine the annual valuation net premiums as that uniform percentage (the valuation net premium ratio) of the respective gross premiums, such that at issue the actuarial present value of future valuation net premiums shall equal the actuarial present value of future benefits.
### Life Actuarial (A) Task Force/ Health Actuarial (B) Task Force

**Amendment Proposal Form**

1. Identify yourself, your affiliation and a very brief description (title) of the issue.

**Identification:** David Neve, VP and Consulting Actuary, Actuarial Resources Corporation of GA  
**Title of the Issue:** Clarify ULSG NPR calculation requirements

2. Identify the document, including the date if the document is “released for comment,” and the location in the document where the amendment is proposed:

   January 1, 2021 NAIC *Valuation Manual*, but incorporating APF 2020-03  
   Section 2.A.3 
   Section 3.B.1, 2, 5 and 6 
   Section 6.B.5.b 
   Section 3.A 
   Section 3.C.2 and 3

3. Show what changes are needed by providing a red-line version of the original verbiage with deletions and identify the verbiage to be deleted, inserted or changed by providing a red-line (turn on “track changes” in Word®) version of the verbiage. (You may do this through an attachment.)

   See attached.

   As a general overview, Section 3.B.5 stayed in 3.B.5 but was renumbered, but Section 3.B.6 was moved to 3.B.5.b and c.

   Below is a detailed summary of the items that were moved to a new section (and/or renumbered) but were not redlined. In some cases, the wording was redlined after it was moved (if the wording changed).

4. State the reason for the proposed amendment? (You may do this through an attachment.)

The NPR calculation requirements for ULSG products are currently contained in Section 3.B.5 and 3.B.6 of the Valuation Manual. The current wording takes the reader back and forth between Section 3.B.5 and 3.B.6 when trying to follow the reserve calculation for ULSG products, which can be confusing. And the current wording also has led some people to incorrectly interpret Section 3.B.5 to be applicable to UL products without a SG.

The APF combines the current 3.B.5 and 3.B.6 sections into a single section labeled 3.B.5 and clarifies how to determine the NPR when the policy duration at the valuation date is either prior to, or after the SG has expired. Importantly, no change has been made to the current requirements, only the formatting of the requirements to make them easier to follow. Note that the new wording has flipped the order of the old 3.B.5 and 3.B.6 when combining them in the new 3.B.5, but this movement is not shown as a tracked change (since no changes were made to the existing reserve calculation requirements in the two sections).

Section 3.A has also been revised to eliminate the confusion that can arise on whether the NPR for products in the All Other VM-20 Reserving Category is still a VM-20 reserve. The NPR requirement for products in the All Other VM-20 Reserving Category has been moved to Section 3.B.6.

Impacted references have been updated.
ATTACHMENT

Section 2: Minimum Reserve

A. All policies subject to these requirements shall be included in one of the VM-20 Reserving Categories, as specified in Section 2.A.1, Section 2.A.2 and Section 2.A.3 below.

1. Term Reserving Category —

2. ULSG Reserving Category —

3. All Other VM-20 Reserving Category — All policies and riders belonging to the All Other VM-20 Reserving Category are to be included in Section 2.A.3 unless the company has elected to exclude a group of them from the stochastic reserve calculation or both the deterministic and stochastic reserve calculations and has applied the applicable exclusion test defined in Section 6, passed the test and documented the results.

Section 3: Net Premium Reserve

A. Applicability

1. The NPR for each policy must be determined on a seriatim basis pursuant to Section 3.

2. When valuing term riders pursuant to Paragraph E in “Riders and Supplemental Benefits Requirements” in Section II, the reserve requirements for term policies are applicable.

B. NPR Calculation

1. For the purposes of Section 3, the following terms apply:

   d. The “level secondary guarantee” at any time is:

      i. For a shadow account secondary guarantee, the shadow account fund value that would have existed at that time assuming payment of the level gross premium determined according to Section 3.B.3.c.i.1.

      ii. For a cumulative premium secondary guarantee, the amount of cumulative level gross premiums determined according to Section 3.B.5.c.i.1, accumulated with any interest or accumulation factors per the contract provisions for the secondary guarantee.

2. Section 3.B.4 and Section 3.B.5 provide the calculation of a terminal NPR under the assumption of an annual mode gross premium. In Section 3.B.4 and Section 3.B.5, the gross premium referenced is the gross premium for the policy assuming an annual premium mode.

4. For all policies and riders within the Term Reserving Category, other than those addressed in Section 3.B.8 below, the NPR on any valuation date shall be equal to the actuarial present value of future benefits less the actuarial present value of future annual valuation net premiums as follows:

5. For all policies and riders within the ULSG Reserving Category, the NPR shall be determined as follows:

   a. If the policy duration on the valuation date is prior to the point when all secondary guarantee periods have expired, the NPR shall be the greater of the reserve amount determined in Section

   Deleted: (Life Insurance Policies Subject to Section 3.A.2)

   Deleted: term policy and for each ULSG

   Deleted: "Except for policies subject to Section 3.A.1, the NPR shall be determined pursuant to applicable methods in VM-A and VM-C for the basic reserve. The mortality tables to be used are those defined in Section 3.C.1 and in VM-M Section 1.H."

   Deleted: i

   Deleted: ii

   Deleted: Section 3.B.4 and Section 3.B.5 provide the calculation of a terminal NPR under the assumption of an annual mode gross premium. In Section 3.B.4 and Section 3.B.5, the gross premium referenced is the gross premium for the policy assuming an annual premium mode.

   Deleted: and Section 3.B.6

   Deleted: and Section 3.B.6

   Commented [MR1]: Section 3.B.5.a was moved from what was previously part of the first sentence of Section 3.B.5

   Deleted: p

   Deleted:

b. If the policy duration on the valuation date is after the expiration of all secondary guarantee periods, the NPR shall be the reserve amount determined according to Section 3.B.5.d only, subject to the floors specified in 3.D.2.

c. The reserve amount for the policy shall be calculated assuming the secondary guarantee is in effect as described below. If the policy has multiple secondary guarantees, the NPR shall be calculated as below for the secondary guarantee that provides the greatest NPR as of the valuation date. For the purposes of this subsection, let n be the longest number of years the policy can remain in force under the provisions of the secondary guarantee. However, if a shorter period produces a materially greater NPR, then n shall be that shorter number of years.

i. As of the policy issue date:
   a) Determine the level gross premium at issue, assuming payments are made each year for which premiums are permitted to be paid, such period defined as v years in this subsection, that would keep the policy in force to the end of year n, based on policy provisions, including the secondary guarantee provisions, such as mortality, interest and expenses. In no event shall v be greater than n for purposes of the NPR calculated in this subsection.
   b) Using the level gross premium from Section 3.B.5.c.i.a above, determine the value of the expense allowance components for the policy at issue as $x_1$, $y_{2.5} - z_5$ and $z_5$ defined below.
      
      - $x_1$ = a first-year expense equal to the level gross premium at issue
      - $y_{2.5} - z_5$ = an expense equal to 10% of the level gross premium and applied in each year from the second through fifth policy year
      - $z_5$ = a first-year expense of $2.50 per $1,000 of insurance issued

      The expense allowance shall be amortized over the span of years in the secondary guarantee period during which premiums are permitted to be paid. $E_{j,t}$, the expense allowance balance as of the end of the policy year t, shall be computed as follows:

      $E_{j,t} = VNPRA \alpha_{j+t+1}^t \left( \frac{x_1}{x_1} + y_{2.5} \cdot C_{j+1} \right)$

      for $t < v$

      0

      for $t \geq v$

      Where:

      $VNPRA = \text{Valuation Net Premium Ratio from 3.B.5.c.i}$

      $C_{j+1} = 0$

      when $t = 1$

      $\alpha_{j+t+1}^t$ = when $2 \leq t \leq 5$

      $- \sum_{s=2}^{5} \left( 1 / \alpha_{j+s+1}^t \right)$

      when $t > 5$

      $j = 1, 2, ...$ (number of completed years since issue)

      c) Determine the annual valuation net premiums at issue as that uniform percentage (the valuation net premium ratio) of the respective gross premiums such that at issue the
actuarial present value of future valuation net premiums over the n-year period shall equal the actuarial present value of future benefits over the n-year period. The valuation net premium ratio determined shall not change for the policy.

ii. After the policy issue date, on each future valuation date, the NPR shall be determined as follows:

a) As of the valuation date for the policy being valued, determine the actual secondary guarantee, denoted ASG_{t,n}, as outlined in Section 3.B.1.c and the fully funded secondary guarantee, denoted FFSG_{t,n}, as outlined in Section 3.B.1.b.

b) Divide ASG_{t,n} by FFSG_{t,n}, with the resulting ratio capped at 1. The ratio is intended to measure the level of prefunding for a secondary guarantee, which is used to establish reserves. Assumptions within the numerator and denominator of the ratio, therefore, must be consistent in order to appropriately reflect the level of prefunding. As used here, “assumptions” include any factor or value, whether assumed or known, which is used to calculate the numerator or denominator of the ratio.

c) Compute the net single premium (NSP_{t,n}) on the valuation date for the coverage provided by the secondary guarantee for the period of time ending at attained age x+n, using the interest, lapse and mortality assumptions prescribed in Section 3.C below. The net single premium (NSP) shall include consideration for death benefits only.

d) The NPR for an insured age x at issue at time t shall be according to the formula below:

\[
\text{NPR}_x = \frac{\text{ASG}_{x+t}}{\text{FFSG}_{x+t}} \times \frac{1}{1} \times \text{NSP}_{x+t} - E_{x+t}
\]

Guidance Note: For a non-integer value of t, E_{x+t} is obtained by taking the present value at duration t of E_{x+n}, where T is the next higher integer; i.e., entails discounting by valuation interest, mortality, and lapse for the fractional year between the valuation date and next anniversary (T – t).

iii. Actuarial present values referenced in this Section 3.B are calculated using the interest, mortality and lapse assumptions prescribed in Section 3.C below.

d. A reserve amount for the policy shall be calculated assuming the secondary guarantee is not in effect. The reserve amount shall be determined by the policy features and guarantees of the policy without considering any secondary guarantee provisions as follows:

i. Determine the level gross premium at issue, assuming payments are made each year for which premiums are permitted to be paid, such period defined as “s” in this subsection, that would keep the policy in force for the entire period coverage is to be provided based on the policy guarantees of mortality, interest, and expenses.

ii. Using the level gross premium from Section 3.B.5.d.i, determine the value of the expense allowance components for the policy at issue as x_1, y_2, and z_2 defined below.

x_1 = a first-year expense equal to the level gross premium at issue

y_2 = an expense equal to 10% of the level gross premium and applied in each year from the second through fifth policy year

z_2 = a first-year expense of $2.50 per $1,000 of insurance issued

Confidential
The expense allowance shall be amortized over the period during which premiums are permitted to be paid. $E_{x+t}$, the expense allowance balance, as of the end of policy year $t$, shall be calculated as follows:

$$E_{x+t} = VNPR \times \tilde{a}_{x+t}\text{\|}(x_{1} + x_{2})/\tilde{a}_{x}\text{\|} + y_{2-s-t}C_{x+t}$$

for $t < s$

$= 0$

for $t \geq s$

Where:

$t = 1,2,..$ (number of completed years since issue)

$$VNPR = \frac{\text{Valuation Net Premium Ratio from 3.B.5.i}}{}$$

$$C_{x+t} = 0 \quad \text{when } t = 1$$

$$= \sum_{i=0}^{t-1} \left( \frac{1}{\hat{a}_{x+t+i}} \right) \quad \text{when } 2 \leq t \leq 5$$

$$= C_{x+t+5} \quad \text{when } t > 5$$

iii. Determine the annual valuation net premiums as that uniform percentage (the valuation net premium ratio) of the respective gross premiums, such that at issue the actuarial present value of future valuation net premiums shall equal the actuarial present value of future benefits.

iv. For a policy issued at age $x$, at any duration $t$, the net premium reserve shall equal:

$$m_{x+t} \times r_{x+t} \quad \text{Where:}$$

a) $m_{x+t}$ = the actuarial present value of future benefits less the actuarial present value of future valuation net premiums and less the unamortized expense allowance for the policy, $E_{x+t}$.

Guidance Note: For a non-integer value of $t$, $E_{x+t}$ is obtained by taking the present value at duration $t$ of $E_{x+\lfloor t \rfloor}$, where $\lfloor t \rfloor$ is the next higher integer; i.e., entails discounting by valuation interest and survivorship for the fractional year between the valuation date and the next anniversary ($T - t$).

b) Let:

$$e_{x+t} = \max(\text{the actual policy fund value on the valuation date}, 0)$$

$$f_{x+t} = \text{the policy fund value on the valuation date is that amount which, together with the payment of the future level gross premiums determined in Section 3.B.5.d.i above, keeps the policy in force for the entire period coverage is to be provided, based on the policy guarantees of mortality, interest and expenses.}$$

Then set $r_{x+t}$ equal to:

$$1, \text{ if } f_{x+t} \leq 0$$

$$\min[(e_{x+t}/f_{x+t}), 1], \text{ otherwise}$$

v. The future benefits used in determining the value of $m_{x+t}$ shall be based on the greater of $e_{x+t}$ and $f_{x+t}$ together with the future payment of the level gross premiums determined in Section 3.B.5.d.i above, and assuming the policy guarantees of mortality, interest and expenses.
vi. The values of $\bar{a}$ are determined using the NPR interest, mortality and lapse assumptions applicable on the valuation date.

vii. Actuarial present values referenced in this Section 3.B.5.d are calculated using the interest, mortality and lapse assumptions prescribed in Section 3.C.

6. For all policies and riders within the All Other VM-20 Reserving Category, the NPR shall be determined pursuant to applicable methods in VM-A and VM-C for the basic reserve. The mortality tables to be used are those defined in Section 3.C.1 and in VM-M Section 1.H.

7. The actuarial present value of future benefits equals the present value of future benefits including, but not limited to, death, endowment (including endowments intermediate to the term of coverage) and cash surrender benefits. Future benefits are before reinsurance and before netting the repayment of any policy loans.

8. For life insurance coverage that the company has assumed on a YRT basis, the reinsurer’s net premium reserve shall be one half year’s cost of insurance for the reinsured net amount at risk.

C. Net Premium Reserve Assumptions

2. Interest Rates
   b. For NPR amounts calculated according to Section 3.B.4 or Section 3.B.5.e.

3. Lapse Rates
   c. For NPR amounts calculated according to Section 3.B.5.e the lapse rate, $L_{x+t}$, for an insured age $x$ at issue for all durations subsequent to the valuation date shall be determined as follows:

i. Determine the ratio $R_{x+t}$ where:

$R_{x+t} = [FFSG_{x+t} - ASG_{x+t}] / [FFSG_{x+t} - LSG_{x+t}] \text{ but not } > 1 \text{ and not } < 0$

Where:

$FFSG_{x+t}$ = the fully funded secondary guarantee on the valuation date for the insured age $x$ at issue

$ASG_{x+t}$ = the actual secondary guarantee on the valuation date for the insured age $x$ at issue

$LSG_{x+t}$ = the level secondary guarantee on the valuation date for the insured age $x$ at issue

**Guidance Note:** The $FFSG_{x+t}$, $ASG_{x+t}$, and $LSG_{x+t}$ are based on the secondary guarantee values as of the valuation date and will remain constant throughout the cash flow projection. This will result in a constant lapse assumption, calculated as of the valuation date, that does not vary by duration throughout the cash flow projection for the NPR calculation.

ii. As of the valuation date, which is $t$ years after issue, the annual lapse rate for the policy shall be assumed to be level for all future years and denoted as $L_{x+t}$, which shall be set equal to:

$L_{x+t} = R_{x+t} \times 0.01 + (1 - R_{x+t}) \times 0.005 \times r_{x+t}$

Confidential
Where $r_{x+t}$ is the ratio determined in Section 3.B.5.d.

**Guidance Note:** By similar logic, it follows (from ASG $x+t$ being 0 when $t=0$) that the level annual lapse rate to be used in the calculations in Section 3.B.5.c.i.b and 3.B.5.c.i.c is 1%. On the other hand, when performing the calculations in Section 3.B.5.c.ii.c, $L_{x+t}$, though level, is not generally equal to what it was for the same policy on the previous valuation date.

**Section 6: Stochastic and Deterministic Exclusion Tests**

**B. Deterministic Exclusion Test (DET)**

5. For purposes of determining the valuation net premiums used in the demonstration in Section 6.B.2:

   a. If pursuant to Section 2, the NPR for the group of policies is the minimum reserve required under VM-A and VM-C, then the valuation net premiums are determined according to those minimum reserve requirements.

   b. If the NPR is determined according to Section 3.B.4 or Section 3.B.5, then the lapse rates assumed for all durations shall for the purposes of the DET be set to 0%;
The Life Actuarial (A) Task Force met June 17, 2021. The following Task Force members participated: Doug Slape, Chair, represented by Mike Boerner, Rachel Hemphill, and Karen Jiang (TX); Judith L. French, Vice Chair, represented by Jason Wade (OH); Lori K. Wing-Heier represented by Sharon Comstock (AK); Jim L. Ridling represented by Jennifer Li and Steve Ostlund (AL); Ricardo Lara represented by Thomas Reedy and Perry Kupferman (CA); Michael Conway represented by Eric Unger (CO); Andrew N. Mais represented by Wanchin Chou (CT); Doug Ommen represented by Mike Yanacheak (IA); Dana Popish Severinghaus represented by Bruce Sartain and Vincent Tsang (IL); Amy L. Beard represented by Fred Andersen and John Robinson (MN); Clora Lindley-Myers represented by William Leung (MO); Eric Dunning represented by Rhonda Ahrens (NE); Marlene Caride represented by David Wolf (NJ); Linda A. Lacewell represented by Bill Carmello and Amanda Fenwick (NY); Glenn Mulready represented by Andrew Schallhorn (OK); Jonathan T. Pike represented by Tomasz Serbinowski (UT); Scott A. White represented by Craig Chupp (VA); and James A. Dodrill represented by Joylynn Fix (WV).

1. **Discussed Amendment Proposal 2021-08**

Brian Bayerle (American Council of Life Insurers—ACLI) said the ACLI comment letter (Attachment A) reiterates the ACLI verbal comments from the Task Force’s June 10 meeting. The comments included concerns about amendment proposal 2021-08 (Attachment B) aiming to reduce the data lag given the expected implementation of additional data elements in 2023. Mr. Boerner noted that the accelerated underwriting data elements, which comprise most of the additional elements, will not be added until 2023 or 2024. He suggested that the workload issues of concern to the ACLI can be addressed at that time. Pat Allison (NAIC) said the amount of work related to implementing the additional data elements into the data collection process is substantial. She noted that adding accelerated underwriting data elements may scope in some companies that are not currently subject to the data collection requirements. She said the current stability of the data collection process gives NAIC staff comfort with collecting two years of data in 2022 to facilitate the reduction in the data lag. She said the data collection process workload will be lighter if the data lag reduction occurs prior to the implementation of the additional data elements. Larry Bruning (Society of Actuaries—SOA) said the 2015 Valuation Basic Table (VBT) is based on industry experience from 2002 through 2009, making the data 12–15 years old. He said confidence intervals of actual to expected mortality for the 2015 VBT, updated with data through 2016, showed that the 2015 VBT is out of date when compared to current experience. Mary Bahna-Nolan (SOA) said there is not enough information to properly analyze the underlying reasons for the lower actual to expected confidence intervals. She said the additional data that can be collected by reducing the data lag is essential for developing a new VBT in a timely manner. Mr. Chou agreed that reducing the time lag prior to introducing the accelerated underwriting data elements is preferable. Ms. Ahrens expressed concerns about the impact reducing the data lag will have on company and state insurance regulator workload. Mr. Bayerle asked if accommodations will be made for companies that are unable to meet the required timeline due to the reduced data lag. Ms. Allison said it may be possible to extend the timeline. Dan Schelp (NAIC) agreed to review the *Valuation Manual* to determine the degree of discretion the NAIC may have in moving the target dates. Mr. Boerner said the discussion will continue when additional information from Mr. Schelp is available.

2. **Appoint a Subgroup to Consider Interim Values for ILVAs**

Mr. Weber said additional regulation is required to establish interim values for index-linked variable annuities (ILVAs). He asked the Task Force to appoint a subgroup to address the issue. He proposed a single charge for Task Force consideration. Mr. Serbinowski made a motion, seconded by Ms. Ahrens, to adopt the subgroup charge (Attachment C) and allow the subgroup members to determine whether to retain the name Index-Linked Variable Annuity (A) Subgroup, as identified in the charge. The motion passed unanimously.

3. **Discussed Amendment Proposal 2020-12**

Ms. Hemphill said several changes have been made to amendment proposal 2020-12 (Attachment D) to narrow its scope. She said the intent of the changes is to take a principle-based approach to hedging as opposed to addressing specific hedging strategies. Ken Christy (Allianz) discussed the Allianz comment letter (Attachment E). He said the issues stated in the letter have been addressed by the changes to amendment proposal 2020-12. Discussion of the proposal will resume on June 24.

Having no further business, the Life Actuarial (A) Task Force adjourned.
Brian Bayerle  
Senior Actuary  

June 14, 2021  

Mr. Mike Boerner  
Chair, NAIC Life Actuarial (A) Task Force (LATF)  

Re: ACLI Comments on AFP 2021-08  

Dear Mr. Boerner:  

The American Council of Life Insurers (ACLI) appreciates the opportunity to provide comments on AFP 2021-08.  

ACLI supports the monitoring of experience and development of valuation basic tables reflecting recent experience. With the move to accelerated underwriting, we appreciate the need for additional data for analysis. However, we are concerned about the timing of this change; specifically, with the anticipated increase of data elements to, among other things, collect more data for accelerated underwriting under development, we believe this APF should be deferred until companies have had an opportunity to include additional data in their submissions.  

Companies that are familiar with experience data submission note the possibility of certain data quality issues when validating the data. They have concerns that making a Q2 data extract in time for a Q3 submission does not provide sufficient to thoroughly vet the data before submission. The reduction from 2 years to 1 year might stress the process. One notable area of concerns is terminations, which may not be reviewed until the following year. The compressed timeframe gives little time to appropriately validate the work. The current 2-year lag provides a significant amount of time for the submission, and while a shorter lag with a longer submission period may work, it would not materially improve the availability of data for analysis.  

Additionally, we know additional data elements will be added to the experience reporting format. It will take companies time to incorporate the new fields, and critically, to validate the values before submission. This increase in requirements may pose problems with a shorter turnaround.  

ACLI is committed to working with regulators on timely experience data submissions. While we have concerns at this time, we would encourage further discussion on how to best incorporate emerging experience. As this APF is further contemplated, we would encourage providing additional hardship allowances for both the expansion of the data elements as well as potential reduction of the lag.
We look forward to a discussion of this amendment on a future call. We appreciate the consideration of our comments.

Sincerely,

[Signature]

cc: Reggie Mazyck, NAIC
Life Actuarial (A) Task Force/ Health Actuarial (B) Task Force

Amendment Proposal Form*

1. Identify yourself, your affiliation and a very brief description (title) of the issue.
   
   Society of Actuaries Valuation Basic Table Team – Chair Larry Bruning

   Revisions to VM-51 to allow for the data experience reporting observation calendar year to be one year prior to the reporting calendar year.

2. Identify the document, including the date if the document is “released for comment,” and the location in the document where the amendment is proposed:

3. Show what changes are needed by providing a red-line version of the original verbiage with deletions and identify the verbiage to be deleted, inserted or changed by providing a red-line (turn on “track changes” in Word®) version of the verbiage. (You may do this through an attachment.)

   Section 2: Statistical Plan for Mortality

   D. Process for Submitting Experience Data Under This Statistical Plan

   Data for this statistical plan for mortality shall be submitted on an annual basis. Each company required to submit this data shall submit the data using the Regulatory Data Collection (RDC) online software submission application developed by the Experience Reporting Agent. For each data file submitted by a company, the Experience Reporting Agent will perform reasonability and completeness checks, as defined in Section 4 of VM-50, on the data. The Experience Reporting Agent will notify the company within 30 days following the data submission of any possible errors that need to be corrected. The Experience Reporting Agent will compile and send a report listing potential errors that need correction to the company.

   Data for this statistical plan for mortality will be compiled using a calendar year method. The reporting calendar year is the calendar year that the company submits the experience data. The observation calendar year is the calendar year of the experience data that is reported. The observation calendar year will be one year prior to the reporting calendar year. For example, if the current calendar year is 2022 and that is the reporting calendar year, the company is to report the experience data that was in-force or issued in calendar year 2021, which is the observation calendar year.

   For the 2022 reporting calendar year, companies that are required to submit data for this statistical plan for mortality will be required to submit two observation calendar years of data, namely observation calendar year 2020 and observation calendar year 2021. For reporting calendar years after 2022, companies that are required to submit data for this statistical plan for mortality will be required to submit one observation calendar year of data.

   Given an observation calendar year of 20XX, the calendar year method requires reporting of experience data as follows:

   i. Report policies in force during or issued during calendar year 20XX.
ii. Report terminations that were incurred in calendar year 20XX and reported before July 1, 20XX+1. However, exclude rescinded policies (e.g., 10-day free look exercises) from the data submission.

For any reporting calendar year, the data call will occur during July of that reporting calendar year, and data is to be submitted according to the requirements of the Valuation Manual in effect during that calendar year. For the 2022 reporting calendar year, the requirements of the 2022 Valuation Manual will be used for both the 2020 and 2021 observation years. Data submissions must be made by Sept. 30 of the reporting calendar year. Corrections of data submissions must be completed by Dec. 31 of the reporting calendar year.

4. State the reason for the proposed amendment? (You may do this through an attachment.)

This APF is needed for the following reasons:

1. There is a need to shorten the time period between data observation and data collection to facilitate more timely analysis and reporting of mortality experience.
2. Under a Principle Based Reserving methodology, valuation basic tables should reflect recent and current mortality experience.
June 17, 2021

To: Life Actuarial Task (A) Force Members

From: Pete Weber, Vice Chair
Life Actuarial Task (A) Force

A design of annuity product has emerged over the past several years that does not fall neatly into existing regulations. They are commonly referred to as ILVAs – Index-Linked Variable Annuities or "RILAs" – Registered Index-Linked Annuities. These products are exclusively filed in the states as variable annuities and are funded through non-unitized separate accounts. The Task Force has discussed developing a draft standard for minimum interim values for these products and providing direction for implementing the standard.

This document proposes the establishment of a new Indexed-Linked Variable Annuity (A) Subgroup and provides an accompanying charge to develop the interim value standard. The Task Force is asked to consider approval of the Subgroup and the adoption of its proposed charge.

The Subgroup will be identified as follows:

**Index-Linked Variable Annuity (A) Subgroup**

Pete Weber, Chair

Staff: Reggie Mazyck

2021 Charge:

The **Index-Linked Variable Annuity (A) Subgroup** will:

1. Provide recommendations and changes, as appropriate, to nonforfeiture, or interim value requirements related to Index-Linked Variable Annuities
1. Identify yourself, your affiliation and a very brief description (title) of the issue.

**Identification:**
Rachel Hemphill and Karen Jiang, Texas Department of Insurance

**Title of the Issue:**
Create consistency between CDHS determination in VM-20 and VM-21. Revise hedge modeling to only require CDHS if modeling future hedging reduces the reserves under VM-20 or TAR under VM-21.

2. Identify the document, including the date if the document is “released for comment,” and the location in the document where the amendment is proposed:

January 1, 2021 NAIC Valuation Manual

3. Show what changes are needed by providing a red-line version of the original verbiage with deletions and identify the verbiage to be deleted, inserted or changed by providing a red-line (turn on “track changes” in Word®) version of the verbiage. (You may do this through an attachment.)

See attached.

4. State the reason for the proposed amendment? (You may do this through an attachment.)

**6/17/2021 Notes:**

We have made notes (highlighted in yellow) in the below summary of the 4/2/2021 and 5/17/2021 updates to emphasize the treatment of macro hedging (excluded from the scope of this APF), hedging strategies that are still in the formative stages (excluded from the scope of this APF), and conservative simplifications (allowed, as always, with documentation). We also addressed the concern that SHS could be perceived as one-sided. See below for full context/intent.

**Summary of 5/17/2021 Editorial Changes and Clarifications:**

1. Editorial changes were made in response to the comment by John Robinson of MN:
   a. Replace “hedge” with “hedging” when used as an adjective.
   b. Clarify that the Principles apply to the modeling of a CDHS or SHS.
   c. Add references to “one or more” CDHS or SHS, to reflect that a company may have multiple CDHS or SHS.
d. Add reference to a CDHS that the company is following.

2. Clarifying edits were made in response to the comment ACLI:
   a. Clarify that PBR reflecting a company’s investment policy and risk management strategies supporting the policies or contracts does not target, deem illegitimate, or otherwise reflect a negative view on the company’s investment policy and risk management strategies supporting the policies or contracts. In fact, the opposite is true. Note that this is consistent with VM-20 Section 7.K.1’s treatment of non-hedging derivative use.
   b. Clarify even further that the CDHS requirements are documentation requirements (i.e., documentation clearly defining the hedging strategy) and may always be satisfied at the company’s option. (6/17/2021 Added Emphasis: There has been the suggestion that SHS is one-sided. But we can see that that is not true, when we see that the consideration of SHS and CDHS are each necessary and complementary pieces of a complete PBR treatment of hedging, the result of the two pieces together being “model your hedging, but only reflect a benefit from hedging if you have provided adequate documentation of your hedging program so that regulators can rely on its projected performance.”)
   c. Clarify that SHS “are normally modeled as part of any of the company’s risk assessment and evaluation processes” (emphasis added).

3. Materiality was explicitly addressed. (6/17/2021 Added Emphasis: A company may continue doing conservative simplifications, such as not modeling hedging that would have been a benefit for them to model. In these cases, the intent is for there to be transparency, documentation, and support of the simplification in the PBR Report. As with all simplifications, the support can range from a robust analysis to a qualitative analysis, depending on the individual company situation.)

Summary of 4/2/2021 Updates:

1. Revisions were made to VM-20 Section 7.K.4 (add “supporting the policies”) and VM-21 Section 9.A.6 (add “supporting the contracts”) in response to Nationwide’s comments. (6/17/2021 Added Emphasis: These edits were to clarify that macro hedging was not in scope.)

2. We added a definition for “hedging transactions,” taken from the APPM but modified slightly to be consistent with Valuation Manual terminology in response to Will Wilton’s comments.

3. We have updated the list of CDHS criteria in response to Will Wilton’s comments where we agreed:
   a. Added “significant” before risks in item (c) of the CDHS definition.
   b. Combined items (f) – (h) in the CDHS definition.
   c. Change “person or persons” to “group or area, including whether internal or external,” in item (j) of the CDHS definition.
   d. We did not remove items (k) or (l) as suggested by Will Wilton, as we find this information useful to regulators. Given that these are retained, and because we were uncertain what else would be included in the new “primary risks” item suggested by Will Wilton, we have not added it. If we can be provided additional information on the risks to be reflected under this new item, an edit could be made.

4. We modified the definition of a SHS to clarify “normally modelled” in response to the ACLI comment and clarify what may be a SHS in response to Will Wilton’s comment (e.g., a single bond would not be a SHS). (6/17/2021 Added Emphasis: We would not consider a hedging strategy that is in the formative stages to be “normally modelled” just because of some sensitivity testing or other analysis as the hedging approach is formed. However, the determination of “normally modelled” appropriately requires judgment and is intended to encourage robust discussions with domestic regulators.)
We propose having consistent requirements for a CDHS in VM-20 and VM-21, as well as any future work on VM-22, and consolidating these requirements in the VM-01 definition of a CDHS. This involves adding two criteria to VM-21’s definition of CDHS that currently exist for VM-20:

- Areas where basis, gap or assumption risk related to the hedging strategy have been identified.
- The circumstances under which hedging strategy will not be effective in hedging the risks.

These criteria are both reasonable and apply in principle to VM-21, and to any future work on VM-22, as well as VM-20.

Further, we propose revising the requirement for hedging to be a CDHS in order for future hedging to be modeled under VM-20, VM-21, and LR027’s C-3 RBC Amount calculation to only apply when modeling such hedging reduces the life reserve level or variable annuity Total Asset Requirement (TAR) level.

The current regulatory requirements for hedging to be a CDHS in order for future hedging to be modeled under VM-20, modeled under VM-21, modeled for the C-3 RBC Amount calculation for variable annuities, and to be eligible for SSAP 108 treatment are all logical requirements when one considers whether hedging should be allowed to reduce the life reserve level or variable annuity TAR level, or whether any mismatch between movements in hedge assets and movements in the corresponding reserve levels should be allowed to be amortized over time.

However, this same requirement has led to a situation of there being unintended optionality in whether a hedging strategy that is like a CDHS is modeled or is not modeled, since a company may choose to satisfy or not satisfy certain of the criteria. This has been especially relevant for cases where modeling a company’s hedging strategy would increase reserves or variable annuity TAR.

As noted in the current guidance note in VM-20 Section 7.K.1 in the 2021 Valuation Manual:

“The prohibition in these modeled reserve requirements against projecting future hedging transactions other than those associated with a clearly defined hedging strategy is intended to address initial concerns expressed by various parties that reserves could be unduly reduced by reflection of programs whose future execution and performance may have greater uncertainty. The prohibition appears, however, to be in conflict with Principle 2 listed in VM-21. Companies may actually execute and reflect in their risk assessment and evaluation processes hedging strategies similar in many ways to clearly defined hedging strategies but lack sufficient clarity in one or more of the qualification criteria. By excluding the associated derivative instruments, the investment strategy that is modeled may also not reflect the investment strategy the company actually uses. Further, because the future hedging transactions may be a net cost to the company in some scenarios and a net benefit in other scenarios, the exclusion of such transactions can result in a modeled reserve that is either lower or higher than it would have been if the transactions were not excluded. The direction of such impact on the reserves could also change from period to period as the actual and projected paths of economic conditions change. A more graded approach to recognition of non-qualifying hedging strategies may be more theoretically consistent with Principle 2. It is recommended that as greater experience is gained by actuaries and state insurance regulators with the principle-based approach and as industry hedging programs mature, the various requirements of this section be reviewed.”

We propose to continue addressing the regulatory concern that reserves could be unduly reduced by reflection of programs whose future execution and performance may have greater uncertainty, by continuing to only allowing hedging strategies that qualify as a CDHS to reduce life reserves and variable annuity TAR. However, we propose that the treatment of CDHS be made more principles-based and less subject to manipulation. To accomplish this, the proposal requires that any hedging strategy that is a part
of the investment strategy supporting the policies and is normally modeled as part of the company’s risk assessment and evaluation processes be modeled as if it were a CDHS if doing so results in an increase in life reserves or variable annuity TAR.

That is, CDHS becomes a requirement solely for hedging strategies that reduce life reserves or variable annuity TAR, and so becomes a more clear regulatory guardrail requiring that hedging strategies that reduce life reserves or variable annuity TAR must be clearly defined.

We continue to need the concept of a CDHS. A CDHS simply formally documents items that a company should be able to document for a robust, well-defined hedging strategy. It requires that the following be identified:

a. The specific risks being hedged (e.g., cash flow, policy interest credits, delta, rho, vega, etc.).
b. The hedge objectives.
c. The risks that are not hedged (e.g., variation from expected mortality, withdrawal, and other utilization or decrement rates assumed in the hedging strategy, etc.).
d. The financial instruments used to hedge the risks.
e. The hedge trading rules, including the permitted tolerances from hedging objectives.
f. The metrics for measuring hedging effectiveness.
g. The criteria used to measure hedging effectiveness.
h. The frequency of measuring hedging effectiveness.
i. The conditions under which hedging will not take place.
j. The person or persons responsible for implementing the hedging strategy.
k. Areas where basis, gap or assumption risk related to the hedging strategy have been identified.
l. The circumstances under which hedging strategy will not be effective in hedging the risks.

While the last two criteria have historically applied for life but not variable annuities, these are all reasonable documentation items that for a robust, well-defined hedging strategy regardless of whether the product is life or variable annuity.

The concept of a CDHS is used for accounting in SSAP 108. SSAP 108 allows companies to set up a deferred asset or liability to amortize the mismatch between changes in the value of the liability and changes in the value of the hedging instruments attributable to the hedged risk underlying a highly effective CDHS modeled for VM-21. Allowing this treatment encourages companies to reduce risk through robust, well-defined and highly effective hedging. Without having the hedging strategy be well-defined, regulators could not rely on past effectiveness being indicative of future effectiveness, and so could not offer companies the benefit of SSAP 108 treatment. Once we recognize the need for a concept of a well-defined hedging strategy, the only question is what criteria would need to be met to be considered well-defined – that is, what criteria should be required to be considered a CDHS. This is a distinct question from whether the concept of a CDHS is needed. We have not heard critiques of individual criteria in the CDHS definition, but consideration of the criteria is appropriate as we go forward to make the definitions in VM-20 and VM-21 consistent. Similarly, in reserve and capital calculations, we rely on the concept of historical effectiveness to determine an error factor. If modeling hedging reduces the reserve or capital amount, the error factor determines the magnitude to which this is reflected. However, this use of the historical effectiveness relies on the hedging strategy being well-documented and comparable between historical hedging and planned future hedging. So, again, a need for hedging strategies to be well-defined presents itself – a CDHS concept is needed.

Finally, edits to VM-31 are needed to reflect these updates and bring VM-20 and VM-21 reporting requirements more in line with one another where appropriate.
**Note on Coordination with RBC and APPM**: We have reviewed, and with these edits there are no corresponding edits necessary for LR027 for RBC but corresponding edits are necessary for SSAP 108. A referral to SAPWG is to be concurrently considered with this APF.

* This form is not intended for minor corrections, such as formatting, grammar, cross-references or spelling. Those types of changes do not require action by the entire group and may be submitted via letter or email to the NAIC staff support person for the NAIC group where the document originated.

**NAIC Staff Comments:**
The term “clearly defined hedging strategy” (CDHS) means a strategy undertaken by a company to manage risks through the future purchase or sale of hedging instruments and the opening and closing of hedging positions. A CDHS must identify:

a. The specific risks being hedged (e.g., cash flow, policy interest credits, delta, rho, vega, etc.).
b. The hedging objectives.
c. The significant risks that are not hedged (e.g., variation from expected mortality, withdrawal, and other utilization or decrement rates assumed in the hedging strategy, etc.).
d. The financial instruments used to hedge the risks.
e. The hedging strategy’s trading rules, including the permitted tolerances from hedging objectives.
f. The metrics, criteria, and frequency for measuring hedging effectiveness.
g. The conditions under which hedging will not take place.
h. The group or area, including whether internal or external, responsible for implementing the hedging strategy.
i. Areas where basis, gap or assumption risk related to the hedging strategy have been identified.
j. The circumstances under which hedging strategy will not be effective in hedging the risks.

The hedging strategy may be dynamic, static or a combination thereof. A strategy involving the offsetting of the risks associated with products falling under the scope of different requirements within the Valuation Manual (e.g., VM-20, VM-21, or VM-22) does not qualify as CDHS.

Guidance Note: All of the principles outlined in VM-21 Section 1.B (particularly Principle 5) apply to the modeling of a CDHS.

The term “hedging transaction” means a derivative(s) transaction which is entered into and maintained to reduce:

a. The risk of a change in the fair value or cash flow of assets and liabilities which the company has acquired or incurred or has a firm commitment to acquire or incur or for which the company has a forecasted acquisition or incurrence; or
b. The currency exchange rate risk or the degree of foreign currency exposure in assets and liabilities which the company has acquired or incurred or has a firm commitment to acquire or incur or for which the company has forecasted acquisition or incurrence.

The term “Seasoned Hedging Strategy” (SHS) means a hedging strategy that is part of the company’s investment strategy and for which future hedging transactions are normally modeled as part of any of the company’s risk assessment and evaluation processes. A SHS may or may not be a CDHS.

The hedging strategy may be dynamic, static, or a combination thereof. A strategy involving the offsetting of the risks associated with products falling under the scope of different requirements within the Valuation Manual (e.g., VM-20, VM-21, or VM-22) does not qualify as SHS.

Guidance Note: All of the principles outlined in VM-21 Section 1.B (particularly Principle 5) apply to the modeling of a SHS.
VM-20 Section 6.A.1.b

A company may not exclude a group of policies for which there is one or more CDHS or one or more SHS required to be modeled pursuant to Section 7.K.4 from stochastic reserve requirements, except in the case where all CDHS and all SHS required to be modeled pursuant to Section 7.K.4 are solely associated with product features that are determined to not be material under Section 7.B.1 due to low utilization.

VM-20 Section 7.E.1.g

Notwithstanding the above requirements, the modeled reserve shall be the higher of that produced by the model investment strategy and that produced by substituting an alternative investment strategy in which the fixed income reinvestment assets have the same weighted average life (WAL) as the reinvestment assets in the model investment strategy and are all public non-callable corporate bonds with gross asset spreads, asset default costs and investment expenses by projection year that are consistent with a credit quality blend of 50% PBR credit rating 6 (A2/A) and 50% PBR credit rating 3 (Aa2/AA).

Policy loans, equities and derivative instruments associated with the execution of a CDHS (in compliance with the definition of CDHS in VM-01) or a SHS that is required to be modeled pursuant to Section 7.K.4 are not affected by this requirement.

VM-20 Section 7.K

K. Modeling of Derivative Programs

1. When determining the deterministic reserve and the stochastic reserve, the company shall include in the projections the appropriate costs and benefits of derivative instruments that are currently held by the company in support of the policies subject to these requirements. The company shall also include the appropriate costs and benefits of anticipated future derivative instrument transactions associated with the execution of a CDHS or a SHS that is required to be modeled pursuant to Section 7.K.4, as well as the appropriate costs and benefits of anticipated future derivative instrument transactions associated with non-hedging derivative programs (e.g., replication, income generation) undertaken as part of the investment strategy supporting the policies, provided they are normally modeled as part of the company’s risk assessment and evaluation processes.

2. For each derivative program that is modeled, the company shall reflect the company’s established investment policy and procedures for that program; project expected program performance along each scenario; and recognize all benefits, residual risks and associated frictional costs. The residual risks include, but are not limited to: basis, gap, price, parameter estimation and variation in assumptions (mortality, persistency, withdrawal, etc.). Frictional costs include, but are not limited to: transaction, margin (opportunity costs associated with margin requirements) and administration. For CDHS or SHS required to be modeled pursuant to Section 7.K.4, the company may not assume that residual risks and frictional costs have a value of zero, unless the company demonstrates in the PBR Actuarial Report that “zero” is an appropriate expectation.

In circumstances where one or more material risk factors related to a derivative program are not fully captured within the cash-flow model used to calculate CTE 70, the company shall reflect such risk factors by increasing the stochastic reserve as described in Section 8.E.
4. If a SHS supporting the policies is not a CDHS but modeling it would result in a material increase to the company’s minimum reserve, then the company shall model the SHS as if it were a CDHS when calculating reserves under VM-20. In addition, if modeling the SHS as if it were a CDHS would result in a decrease in the company’s minimum reserve, the company may provide the documentation required for the SHS to be a CDHS as defined in VM-01 and then model the SHS as a CDHS.

Guidance Note: The intent of reflecting SHS is not to penalize any hedging strategies, but rather to reflect the company’s investment strategy and risk management strategies, including all material established hedging strategies supporting the policies, while requiring CDHS documentation for any such hedging strategies that reduce the minimum reserve.

VM-20 Section 7.L (Remove entire Section 7.L)

Deleted:

- Clearly Defined Hedging Strategy
  - The specific risks being hedged (e.g., cash flow, policy interest credits, delta, rho, vega, etc.).
  - The hedge objectives.
  - The risks that are not hedged (e.g., variation from expected mortality, withdrawal, and other utilization or decrement rates assumed in the hedging strategy, etc.)
  - The financial instruments used to hedge the risks.
  - The hedge trading rules, including the permitted tolerances from hedging objectives.
  - The metrics for measuring hedging effectiveness.
  - The criteria used to measure hedging effectiveness.
  - The frequency of measuring hedging effectiveness.
  - The person or persons responsible for implementing the hedging strategy.
  - Areas where basis, gap or assumption risk related to the hedging strategy have been identified.
  - The circumstances under which hedging strategy will not be effective in hedging the risks.

Guidance Note: For purposes of the above criteria, “effectiveness” need not be measured in a manner as defined in SSAP No. 86—Derivatives in the AP&P Manual.
VM-21 Section 1.D.2 (Delete entire definition and renumber subsequent sections VM-21 Section 1.D.3 and VM-21 Section 1.D.4)

VM-21 Section 4.A.4

Modeling of Hedges

a. For a company that does not have a CDHS or a SHS that is required to be modeled pursuant to Section 9.A.6:

i. The company shall not consider the cash flows from any future hedge purchases or any rebalancing of existing hedge assets in its modeling.

ii. Existing hedging instruments that are currently held by the company in support of the contracts falling under the scope of these requirements shall be included in the starting assets. The hedge assets may then be considered in one of two ways:

a) Include the asset cash flows from any contractual payments and maturity values in the projection model; or

b) No hedge positions – in which case the hedge positions held on the valuation date are replaced with cash and/or other general account assets in an amount equal to the aggregate market value of these hedge positions.

Guidance Note: If the hedge positions held on the valuation date are replaced with cash, then as with any other cash, such amounts may then be invested following the company’s investment strategy.

A company may switch from method a) to method b) at any time, but it may only change from b) to a) with the approval of the domiciliary commissioner.

b. For a company following one or more CDHS or one or more SHS that are required to be modeled pursuant to Section 9.A.6, the detailed requirements for the modeling of hedges are defined in Section 9. The following paragraphs are a high-level summary and do not supersede the detailed requirements.

i. The appropriate costs and benefits of hedging instruments that are currently held by the company in support of the contracts falling under the scope of these requirements shall be included in the projections used in the determination of the stochastic reserve.

ii. The projections shall take into account the appropriate costs and benefits of hedge positions expected to be held in the future through the execution of a CDHS or a SHS that is required to be modeled pursuant to Section 9.A.6. Because models do not always accurately portray the results of hedge programs, the company shall, through back-testing and other means, assess the accuracy of the hedge modeling. The company shall determine a stochastic reserve as the weighted average of two CTE values; first, a CTE70 (“best efforts”) representing the company’s projection of all of the hedge cash flows, including future hedge purchases, and a second CTE70 (“adjusted”) which shall use only hedge assets held by the company on the valuation date and no future hedge purchases. These are discussed in greater detail in Section 9. The stochastic reserve shall be the weighted average of the two CTE70 values, where the weights reflect the error factor (E) determined following the guidance of Section 9.C.8.
iii. The company is responsible for verifying compliance with CDHS requirements or SHS requirements if required to be modeled pursuant to Section 9.A.6, and any other requirements in Section 9 for all hedging instruments included in the projections.

iv. The use of products not falling under the scope of these requirements (e.g., equity-indexed annuities) as a hedge shall not be recognized in the determination of accumulated deficiencies.

**VM-21 Section 4.D.4.b**

Notwithstanding the above requirements, the model investment strategy and any non-prescribed asset spreads shall be adjusted as necessary so that the aggregate reserve is not less than that which would be obtained by substituting an alternative investment strategy in which all fixed income reinvestment assets are public non-callable corporate bonds with gross asset spreads, asset default costs, and investment expenses by projection year that are consistent with a credit quality blend of 50% PBR credit rating 6 (A2/A) and 50% PBR credit rating 3 (Aa2/AA).

Policy loans, equities and derivative instruments associated with the execution of a CDHS (in compliance with the definition of CDHS in VM-01) or a SHS that is required to be modeled pursuant to Section 9.A.6 are not affected by this requirement.

**VM-21 Section 6.B.3.a.ii – Footnote (Footnote at Bottom of Page 21-22)**

Throughout this Section 6, references to CTE70 (adjusted) shall also mean the Stochastic Reserve for a company that does not have a CDHS or a SHS that is required to be modeled pursuant to Section 9.A.6 as discussed in Section 4.A.4.a.

**VM-21 Section 6.B.3.b.ii**

Calculate the Prescribed Projections Amount as the CTE70 (adjusted) using the same method as that outlined in Section 9.C (which is the same as the stochastic reserves following Section 4.A.4.a for a company that does not have a CDHS or a SHS that is required to be modeled pursuant to Section 9.A.6) but substituting the assumptions prescribed by Section 6.C. The calculation of this Prescribed Projections Amount also requires that the scenario reserve for any given scenario be equal to or in excess of the cash surrender value in aggregate on the valuation date for the group of contracts modeled in the projection.

**VM-21 Section 6.B.5**

Cash flows associated with hedging shall be projected in the same manner as that used in the calculation of the CTE70 (adjusted) as discussed in Section 9.C or Section 4.A.4.a for a company without a CDHS or a SHS that is required to be modeled pursuant to Section 9.A.6.

**VM-21 Section 9**

Section 9: Modeling of Hedges under a CDHS
A. Initial Considerations

1. Subject to Section 9.C.2, the appropriate costs and benefits of hedging instruments that are currently held by the company in support of the contracts falling under the scope of these requirements shall be included in the calculation of the stochastic reserve, determined in accordance with Section 3.D and Section 4.D.

2. If the company is following one or more CDHS, in accordance with an investment policy adopted by the board of directors, or a committee of board members, the company shall take into account the costs and benefits of hedge positions expected to be held by the company in the future along each scenario based on the execution of the hedging strategy, and it is eligible to reduce the amount of the stochastic reserve using projections otherwise calculated. The investment policy must clearly articulate the company’s hedging objectives, including the metrics that drive rebalancing/trading. This specification could include maximum tolerable values for investment losses, earnings, volatility, exposure, etc. in either absolute or relative terms over one or more investment horizons vis-à-vis the chance of occurrence. Company management is responsible for developing, documenting, executing and evaluating the investment strategy, including the hedging strategy, used to implement the investment policy.

3. For this purpose, the investment assets refer to all the assets, including derivatives supporting covered products and guarantees. This also is referred to as the investment portfolio. The investment strategy is the set of all asset holdings at all points in time in all scenarios. The hedging portfolio, which also is referred to as the hedging assets, is a subset of the investment assets. The hedging strategy is the hedging asset holdings at all points in time in all scenarios. There is no attempt to distinguish what is the hedging portfolio and what is the investment portfolio in this section. Nor is the distinction between investment strategy and hedging strategy formally made here. Where necessary to give effect to the intent of this section, the requirements applicable to the hedging portfolio or the hedging strategy are to apply to the overall investment portfolio and investment strategy.

4. This particularly applies to restrictions on the reasonableness or acceptability of the models that make up the stochastic cash-flow model used to perform the projections, since these restrictions are inherently restrictions on the joint modeling of the hedging and non-hedging portfolio. To give effect to these requirements, they must apply to the overall investment strategy and investment portfolio.

5. Before either a new or revised hedging strategy can be used to reduce the amount of the stochastic reserve otherwise calculated, the hedging strategy should be in place (i.e., effectively implemented by the company) for at least three months. The company may meet the time requirement by having evaluated the effective implementation of the hedging strategy for at least three months without actually having executed the trades indicated by the hedging strategy (e.g., mock testing or by having effectively implemented the strategy with similar annuity products for at least three months).

6. If a SHS supporting the contracts is not a CDHS but modeling it as if it were a CDHS would result in a material increase in the company’s TAR, then the company shall model the SHS as a CDHS when calculating reserves under AG43 and/or VM-21 and when calculating the C-3 RBC Amount under LR027. In addition, if modeling the SHS as a CDHS would result in a decrease in the company’s TAR, the company may provide the documentation required for the SHS to be a CDHS as defined in VM-01 and then model the SHS as a CDHS when calculating reserves under AG43 and/or VM-21 and when calculating the C-3 RBC Amount under LR027. The company shall not treat a SHS as a CDHS for purposes of SSAP 108 without providing the documentation required for the SHS to be a CDHS as defined in VM-01.

Guidance Note: The intent of reflecting SHS is not to penalize any hedging strategies, but rather to reflect the company’s investment strategy and risk management strategies, including all material established...
B. Modeling Approaches

1. The analysis of the impact of the hedging strategy on cash flows is typically performed using either one of two types of methods as described below. Although a hedging strategy normally would be expected to reduce risk provisions, the nature of the hedging strategy and the costs to implement the strategy may result in an increase in the amount of the stochastic reserve otherwise calculated.

2. The fundamental characteristic of the first type of method, referred to as the “explicit method,” is that hedging positions and their resulting cash flows are included in the stochastic cash-flow model used to determine the scenario reserve, as discussed in Section 3.D, for each scenario.

3. The fundamental characteristic of the second type of method, referred to as the “implicit method,” is that the effectiveness of the current hedging strategy on future cash flows is evaluated, in part or in whole, outside of the stochastic cash-flow model. There are multiple ways that this type of modeling can be implemented. In this case, the reduction to the stochastic reserve otherwise calculated should be commensurate with the degree of effectiveness of the hedging strategy in reducing accumulated deficiencies otherwise calculated.

4. Regardless of the methodology used by the company, the ultimate effect of the current hedging strategy (including currently held hedge positions) on the stochastic reserve needs to recognize all risks, associated costs, imperfections in the hedges and hedging mismatch tolerances associated with the hedging strategy. The risks include, but are not limited to: basis, gap, price, parameter estimation and variation in assumptions (mortality, persistency, withdrawal, annuitization, etc.). Costs include, but are not limited to: transaction, margin (opportunity costs associated with margin requirements) and administration. In addition, the reduction to the stochastic reserve attributable to the hedging strategy may need to be limited due to the uncertainty associated with the company’s ability to implement the hedging strategy in a timely and effective manner. The level of operational uncertainty varies indirectly with the amount of time that the new or revised strategy has been in effect or mock tested.

Guidance Note: No hedging strategy is perfect. A given hedging strategy may eliminate or reduce some but not all risks, transform some risks into others, introduce new risks, or have other imperfections. For example, a delta-only hedging strategy does not adequately hedge the risks measured by the “Greeks” other than delta. Another example is that financial indices underlying typical hedging instruments typically do not perform exactly like the separate account funds, and hence the use of hedging instruments has the potential for introducing basis risk.

5. A safe harbor approach is permitted for CDHS reflection for those companies whose modeled hedge assets comprise only linear instruments not sensitive to implied volatility. For companies with option-based hedge strategies, electing this approach would require representing the option-based portion of the strategy as a delta-rho two-Greek hedge program. The normally modeled option portfolio would be replaced with a set of linear instruments that have the same first-order Greeks as the original option portfolio.

C. Calculation of Stochastic Reserve (Reported)

1. The company shall calculate CTE70 (best efforts)—the results obtained when the CTE70 is based on incorporating the CDHS (including both currently held and future hedge positions) into the stochastic cash-flow model on a best efforts basis, including all of the factors and assumptions needed to execute the CDHS.
2. The company shall calculate a CTE70 (adjusted) by recalculating the CTE70 assuming the company has no CDHS, therefore following the requirements of Section 4.A.4.a.

3. Because most models will include at least some approximations or idealistic assumptions, CTE70 (best efforts) may overstate the impact of the hedging strategy. To compensate for potential overstatement of the impact of the hedging strategy, the value for the stochastic reserve is given by:

\[
\text{Stochastic reserve} = \text{CTE70 (best efforts)} + E \times \max[0, \text{CTE70 (adjusted)} - \text{CTE70 (best efforts)}]
\]

4. The company shall specify a value for \( E \) (the “error factor”) in the range from 5% to 100% to reflect the company’s view of the potential error resulting from the level of sophistication of the stochastic cash-flow model and its ability to properly reflect the parameters of the hedging strategy (i.e., the Greeks being covered by the strategy), as well as the associated costs, risks and benefits. The greater the ability of the stochastic model to capture all risks and uncertainties, the lower the value of \( E \). The value of \( E \) may be as low as 5% only if the model used to determine the CTE70 (best efforts) effectively reflects all of the parameters used in the hedging strategy. If certain economic risks are not hedged, yet the model does not generate scenarios that sufficiently capture those risks, \( E \) must be in the higher end of the range, reflecting the greater likelihood of error. Likewise, simplistic hedge cash-flow models shall assume a higher likelihood of error.

5. The company shall conduct a formal back-test, based on an analysis of at least the most recent 12 months, to assess how well the model is able to replicate the hedging strategy in a way that supports the determination of the value used for \( E \).

6. Such a back-test shall involve one of the following analyses:
   a. For companies that model hedge cash flows directly (“explicit method”), replace the stochastic scenarios used in calculating the CTE70 (best efforts) with a single scenario that represents the market path that actually manifested over the selected back-testing period and compare the projected hedge asset gains and losses against the actual hedge asset gains and losses – both realized and unrealized – observed over the same time period. For this calculation, the model assumptions may be replaced with parameters that reflect actual experience during the back-testing period. In order to isolate the comparison between the modeled hedge strategy and actual hedge results for this calculation, the projected liabilities should accurately reflect the actual liabilities throughout the back-testing period; therefore, adjustments that facilitate this accuracy (e.g. reflecting actual experience instead of model assumptions, including new business, etc.) are permissible.

   To support the choice of a low value of \( E \), the company should ascertain that the projected hedge asset gains and losses are within close range of 100% (e.g., 80–125%) of the actual hedge asset gains and losses. The company may also support the choice of a low value of \( E \) by achieving a high R-squared (e.g., 0.80 or higher) when using a regression analysis technique.

   b. For companies that model hedge cash flows implicitly by quantifying the cost and benefit of hedging using the fair value of the hedged item (an “implicit method” or “cost of reinsurance method”), calculate the delta, rho and vega coverage ratios in each month over the selected back-testing period in the following manner:

      i. Determine the hedge asset gains and losses—both realized and unrealized—incurred over the month attributable to equity, interest rate, and implied volatility movements.
ii. Determine the change in the fair value of the hedged item over the month attributable to equity, interest rate, and implied volatility movements. The hedged item should be defined in a manner that reflects the proportion of risks hedged (e.g., if a company elects to hedge 50% of a contract’s market risks, it should quantify the fair value of the hedged item as 50% of the fair value of the contract).

iii. Calculate the delta coverage ratio as the ratio between (i) and (ii) attributable to equity movements.

iv. Calculate the rho coverage ratio as the ratio between (i) and (ii) attributable to interest rate movements.

v. Calculate the vega coverage ratio as the ratio between (i) and (ii) attributable to implied volatility movements.

vi. To support the company’s choice of a low value of E, the company should be able to demonstrate that the delta and rho coverage ratios are both within close range of 100% (e.g., 80–125%) consistently across the back-testing period.

vii. In addition, the company should be able to demonstrate that the vega coverage ratio is within close range of 100% in order to use the prevailing implied volatility levels as of the valuation date in quantifying the fair value of the hedged item for the purpose of calculating CTE70 (best efforts). Otherwise, the company shall quantify the fair value of the hedged item for the purpose of calculating CTE70 (best efforts) in a manner consistent with the realized volatility of the scenarios captured in the CTE (best efforts).

c. Companies that do not model hedge cash flows explicitly, but that also do not use the implicit method as outlined in Section 9.C.6.b above, shall conduct the formal back-test in a manner that allows the company to clearly illustrate the appropriateness of the selected method for reflecting the cost and benefit of hedging, as well as the value used for E.

7. A company that does not have 12 months of experience to date shall set E to a value that reflects the amount of experience available, and the degree and nature of any change to the hedge program. For a material change in strategy, with no history, E should be at least 0.50. However, E may be lower than 0.50 if some reliable experience is available and/or if the change in strategy is a refinement rather than a substantial change in strategy.

Guidance Note: The following examples are provided as guidance for determining the E factor when there has been a change to the hedge program:
- The error factor should be temporarily large (e.g., ≥ 50%) for substantial changes in hedge methodology (e.g., moving from a fair-value based strategy to a stop-loss strategy) where the company has not been able to provide a meaningful simulation of hedge performance based on the new strategy.
- A temporary moderate increase (e.g., 15–30%) in error factor should be used for substantial modifications to hedge programs or CDHS modeling where meaningful simulation has not been created (e.g., adding second-order hedging, such as gamma or rate convexity).
- No increase in the error factor may be used for incremental modifications to the hedge strategy (e.g., adding death benefits to a program that previously covered only living benefits, or moving from swaps to Treasury Department futures).

D. Additional Considerations for CTE70 (best efforts)

If the company is following a CDHS, the fair value of the portfolio of contracts falling within the scope of these requirements shall be computed and compared to the CTE70 (best efforts) and CTE70 (adjusted). If the CTE70 (best efforts) is below both the fair value and CTE70 (adjusted), the company should be prepared to explain why that result is reasonable.
For the purposes of this analysis, the stochastic reserve and fair value calculations shall be done without requiring the scenario reserve for any given scenario to be equal to or in excess of the cash surrender value in aggregate for the group of contracts modeled in the projection.

E. Specific Considerations and Requirements

1. As part of the process of choosing a methodology and assumptions for estimating the future effectiveness of the current hedging strategy (including currently held hedge positions) for purposes of reducing the stochastic reserve, the company should review actual historical hedging effectiveness. The company shall evaluate the appropriateness of the assumptions on future trading, transaction costs, other elements of the model, the strategy, the mix of business and other items that are likely to result in materially adverse results. This includes an analysis of model assumptions that, when combined with the reliance on the hedging strategy, are likely to result in adverse results relative to those modeled. The parameters and assumptions shall be adjusted (based on testing contingent on the strategy used and other assumptions) to levels that fully reflect the risk based on historical ranges and foreseeable future ranges of the assumptions and parameters. If this is not possible by parameter adjustment, the model shall be modified to reflect them at either anticipated experience or adverse estimates of the parameters.

2. A discontinuous hedging strategy is a hedging strategy where the relationships between the sensitivities to equity markets and interest rates (commonly referred to as the Greeks) associated with the guaranteed contract holder options embedded in the variable annuities and other in-scope products and these same sensitivities associated with the hedging assets are subject to material discontinuities. This includes, but is not limited to, a hedging strategy where material hedging assets will be obtained when the variable annuity account balances reach a predetermined level in relationship to the guarantees. Any hedging strategy, including a delta hedging strategy, can be a discontinuous hedging strategy if implementation of the strategy permits material discontinuities between the sensitivities to equity markets and interest rates associated with the guaranteed contract holder options embedded in the variable annuities and other in-scope products and these same sensitivities associated with the hedging assets. There may be scenarios that are particularly costly to discontinuous hedging strategies, especially where those result in large discontinuous changes in sensitivities (Greeks) associated with the hedging assets. Where discontinuous hedging strategies contribute materially to a reduction in the stochastic reserve, the company must evaluate the interaction of future trigger definitions and the discontinuous hedging strategy, in addition to the items mentioned in the previous paragraph. This includes an analysis of model assumptions that, when combined with the reliance on the discontinuous hedging strategy, may result in adverse results relative to those modeled.

3. A strategy that has a strong dependence on acquiring hedging assets at specific times that depend on specific values of an index or other market indicators may not be implemented as precisely as planned.

4. The combination of elements of the stochastic cash-flow model—including the initial actual market asset prices, prices for trading at future dates, transaction costs and other assumptions—should be analyzed by the company as to whether the stochastic cash-flow model permits hedging strategies that make money in some scenarios without losing a reasonable amount in some other scenarios. This includes, but is not limited to: a. Hedging strategies with no initial investment that never lose money in any scenario and in some scenarios make money.
   b. Hedging strategies that, with a given amount of initial money, never make less than accumulation at the one-period risk-free rates in any scenario but make more than this in one or more scenarios.

5. If the stochastic cash-flow model allows for such situations, the company should be satisfied that the results do not materially rely directly or indirectly on the use of such strategies. If the results do materially rely directly or indirectly on the use of such strategies, the strategies may not be used to reduce the stochastic reserve otherwise calculated.
6. In addition to the above, the method used to determine prices of financial instruments for trading in scenarios should be compared to actual initial market prices. In addition to comparisons to initial market prices, there should be testing of the pricing models that are used to determine subsequent prices when scenarios involve trading financial instruments. This testing should consider historical relationships. For example, if a method is used where recent volatility in the scenario is one of the determinants of prices for trading in that scenario, then that model should approximate actual historic prices in similar circumstances in history.

**VM-31 Section 3.C.5**

**Assets and Risk Management** – A brief description of the asset portfolio, and the approach used to model risk management strategies, such as hedging, and other derivative programs, including a description of any CDHS and any SHS that is required to be modeled pursuant to VM-20 Section 7.K.4.

**VM-31 Section 3.D.6.f**

**Risk Management** – Detailed description of model risk management strategies, such as hedging and other derivative programs, specific to the groups of policies covered in this sub-report and not discussed in the Life Summary Section 3.C.5. This should include documentation for any hedging strategy that meets the requirements to be a CDHS. It should also include, for any SHS that is not a CDHS, documentation of any CDHS criteria met, listine of CDHS criteria not met, and documentation of the impact on minimum reserves of the SHS being modeled as if it were a CDHS. In particular, such documentation should address the directional impact on minimum reserves and whether the impact is material.

a. **Investment Officer on Investments** – A certification from a duly authorized investment officer that the modeled company investment strategy, including any CDHS and any SHS that is required to be modeled pursuant to VM-20 Section 7.K.4, is representative of and consistent with the company’s investment policy.

b. **Qualified Actuary on Investments** – A certification by a qualified actuary, not necessarily the same qualified actuary that has been assigned responsibility for the PBR Actuarial Report or this sub-report, that the modeling of any CDHS and any SHS that is required to be modeled pursuant to VM-20 Section 7.K.4 was performed in accordance with VM-20 and in compliance with all applicable ASOPs, and the alternative investment strategy as defined in VM-20 Section 7.E.1.g reflects the prescribed mix of assets with the same WAL as the reinvestment assets in the company investment strategy.

**VM-31 Section 3.E.5**

**Assets and Risk Management** – A brief description of the general account asset portfolio, and the approach used to model risk management strategies, such as hedging and other derivative programs, including a description of any CDHS or any SHS that is required to be modeled pursuant to VM-21 Section 9.A.5, and any material changes to the hedging strategy from the prior year.
VM-31 Section 3.F.8

Hedging and Risk Management – The following information regarding the hedging and risk management assumptions used by the company in performing a principle-based valuation under VM-21:

a. Strategies – Detailed description of risk management strategies, such as hedging and other derivative programs, including any CDHS or any SHS that is required to be modeled pursuant to VM-21 Section 9.A.6, specific to the groups of contracts covered in this sub-report.
   i. Descriptions of basis risk, gap risk, price risk and assumption risk.
   ii. Methods and criteria for estimating the a priori effectiveness of the strategy.
   iii. Results of any reviews of actual historical hedging effectiveness.

b. CDHS – Documentation for any hedging strategy that meets the requirements to be a CDHS.

c. Other Modeled Hedging Strategies – Documentation for any SHS that is not a CDHS, including documentation of any CDHS criteria met, listing of CDHS criteria not met, and documentation of the impact on TAR of the SHS being modeled as if it were a CDHS. In particular, such documentation should address the directional impact on TAR and whether the impact is material.

d. Strategy Changes – Discussion of any changes to the hedging strategy during the past 12 months, including identification of the change, reasons for the change, and the implementation date of the change.

e. Hedge Modeling – Description of how the hedge strategy was incorporated into modeling, including:
   i. Differences in timing between model and actual strategy implementation.
   ii. For a company that does not have a CDHS or a SHS that is required to be modeled pursuant to VM-21 Section 9.A.6, disclosure of the method used to consider hedge assets included in the starting assets, either (1) including the asset cash flows in the projection model; or (2) replacing the hedge positions with cash and/or other general account assets in an amount equal to the market value of the hedge positions, as discussed in VM-21 Section 4.A.4.a.
   iii. Evaluations of the appropriateness of the assumptions on future trading, transaction costs, other elements of the model, the strategy, and other items that are likely to result in materially adverse results.
   iv. If residual risks and frictional costs are assumed to have a value of zero, a demonstration that a value of zero is an appropriate expectation.
   v. Any discontinuous hedging strategies modeled, and where such discontinuous hedging strategies contribute materially to a reduction in the stochastic reserve, any evaluations of the interaction of future trigger definitions and the discontinuous hedging strategy, including any analyses of model assumptions that, when combined with the reliance on the discontinuous hedging strategy, may result in adverse results relative to those modeled.
   vi. Disclosure of any situations where the modeled hedging strategies make money in some scenarios without losing a reasonable amount in some other scenarios, and an explanation of why the situations are not material for determining the CTE 70 (best efforts).
   vii. Results of any testing of the method used to determine prices of financial instruments for trading in scenarios against actual initial market prices, including how the testing considered historical relationships. If there are substantial discrepancies, disclosure of the substantial discrepancies and documentation as to why the model-based prices are appropriate for determining the stochastic reserve.
   viii. Any model adjustments made when calculating CTE 70 (adjusted), in particular, any liquidation or substitution of assets for currently held hedges.

e. Error Factor (E) and Back-Testing – Description of E, the error factor, and formal back-tests performed, including:
The value of $E$, and the approach and rationale for the value of $E$ used in the reserve calculation.

For companies that model hedge cash flows using the explicit method, as described in VM-21 Section 9.C.6.a, and have 12 months of experience, an analysis of at least the most recent 12 months of experience and the results of a back-test showing that the model is able to replicate the hedging results experienced in a way that justifies the value used for $E$. Include at least a ratio of the actual change in market value of the hedges to the modeled change in market value of the hedges at least quarterly.

For companies that model hedge cash flows using the implicit method, and have 12 months of experience, as described in VM-21 Section 9.C.6.b, the results of a back-test in which (a) actual hedge asset gains and losses are compared against (b) proportional fair value movements in hedged liability, including:

- Delta, rho and vega coverage ratios in each month over the back-testing period, which may be presented in a chart or graph.
- The implied volatility level used to quantify the fair value of the hedged item, as well as the methodology undertaken to determine the appropriate level used.

For companies that do not model hedge cash flows using either the explicit method or the implicit method, as described in VM-21 Section 9.C.6.c, and have 12 months of experience, the results of the formal back-test conducted to validate the appropriateness of the selected method and value used for $E$.

For companies that do not have 12 months of experience, the basis for the value of $E$ is chosen based on the guidance provided in VM-21 Section 9.C.7, considering the actual history available and the degree and nature of any changes made to the hedge strategy.

Safe Harbor for CDHS – If electing the safe harbor approach for CDHS, as discussed in VM-21 Section 9.C.8, a description of the linear instruments used to model the option portfolio.

Hedge Model Results – Disclosure of whether the calculated CTE 70 (best efforts) is below both the fair value and CTE 70 (adjusted), and if so, justification for why that result is reasonable, as discussed in VM-21 Section 9.D.

VM-31 Section 3.F.12.c

CTEPA – If using the CTEPA method, a summary including:

- Disclosure (in tabular form) of the scenario reserves using the same method and assumptions as those used by the company to calculate CTE 70 (adjusted) as outlined in VM-21 Section 9.C (or the stochastic reserves following VM-21 Section 4.A.4.a for a company that does not have a CDHS or a SHS that is required to be modeled pursuant to VM-21 Section 9.A.6), as well as the corresponding scenarios reserves substituting the assumptions prescribed by VM-21 Section 6.C.

- Summary of results from a cumulative decrement projection along the scenario whose reserve value is closest to the CTE 70 (adjusted), as outlined in VM-21 Section 9.C (or the stochastic reserves following VM-21 Section 4.A.4.a for a company that does not have a CDHS or a SHS that is required to be modeled pursuant to VM-21 Section 9.A.6), under the assumptions outlined in VM-21 Section 6.C. Such a cumulative decrement projection shall include, at the end of each projection year, the projected proportion (expressed as a percent of the total projected account value) of persisting contracts as well as the allocation of projected decrements across death, full surrender, account value depletion, elective annuitization, and other benefit election.
Summary of results from a cumulative decrement projection, identical to (ii) above, but replacing all assumptions outlined in VM-21 Section 6.C with the corresponding assumptions used in calculating the stochastic reserve.

**VM-31 Section 3.F.16.a and Section 3.F.16.b**

a. **Investment Officer on Investments** – A certification from a duly authorized investment officer that the modeled asset investment strategy, including any CDHS and any SHS that is required to be modeled pursuant to VM-21 Section 9.A.6, is consistent with the company’s current investment strategy except where the modeled reinvestment strategy may have been substituted with the alternative investment strategy, and also any CDHS meets the requirements of a CDHS.

b. **Qualified Actuary on Investments** – A certification by a qualified actuary, not necessarily the same qualified actuary that has been assigned responsibility for the PBR Actuarial Report or this sub-report, that the modeling of any CDHS and any SHS that is required to be modeled pursuant to VM-21 Section 9.A.6 was performed in accordance with VM-21 and in compliance with all applicable ASOPs.
To: Mr. Mike Boerner, Chair, NAIC Life Actuarial Task Force (LATF)  
06.11.2021  
Regarding: Comments on APF 2020-12

Dear Mr. Boerner,

**Executive Summary**
Thank you for the opportunity to review and share feedback on the proposed changes to APF 2020-12. The collaboration between companies and regulators that we have in the insurance industry is extremely valuable.

I recognize that regulators are concerned with the optionality of including hedging cash flows within the principle-based framework. My understanding of the concern is that regulators want to have confidence that reserves are sufficient, but that can be challenging for a regulator to assess if a certain category of cash flows is excluded.

I understand and appreciate the goal, but I am concerned with the application as written in APF 2020-12. The Valuation Manual does not seem to address the difference in nature between long-term guarantee hedging vs. short-term index-credit hedging. The APF increases the scope of hedges included in the principles-based framework and pushes all hedging programs into a one-size-fits-all approach. The one-size-fits-all approach has some shortcomings when it is applied to index credit hedges. While these concerns exist with or without the adoption of APF 2020-12, the concerns are exaggerated by the proposed changes.

Some concerns with the proposed framework are: the VM-21 Adjusted run is not a good fit for index credit hedges, the VM-20 Stochastic Exclusion Test verbiage does not reflect the relatively lower risk in index credit hedges, and each of these concerns would be inappropriate to be used as precedent for VM-22 in the future.

**VM-21 – Adjusted Run**
My first concern is the application of the VM-21 adjusted run to index credit hedges. The Adjusted vs Best-Efforts runs are a good fit for long-term guarantees because there is often no dynamic interaction between the guarantees and the hedge that supports them. In the example of a GMDB, the company’s responsibility for policyholder benefits is identical with or without a hedge. The guarantee is explicitly stated in the contract.

On the other hand, the crediting strategies offered on Registered Index-Linked Annuities (RILas) have non-guaranteed elements (NGEs) – crediting caps, crediting floors, negative credit buffers, etc. – that are dependent on the company’s ability to hedge. The crediting features offered by the company are different if a hedge is not in place, which would
alter cash flows used in the reserve calculation. Modeling this alternate world in which a hedge does not exist does not provide a meaningful result for the company nor regulator.

It seems most appropriate that RILAs with a CDHS should only utilize the Best Efforts calculation for index-credit hedges due to the inappropriateness of separating the hedge from the liability cash flows.

**VM-20 – Stochastic Exclusion Test**
My second concern is that this change will limit the eligibility of companies to utilize the Stochastic Exclusion Test. The availability of the exclusion tests is to allow products that do not have significant exposure to equity and interest rate risks to limit the procedural complexity of the reserving process. The existence of a CDHS or SHS does not inherently mean that a company has significant equity or interest rate risk impacting their future solvency. Indexed crediting features are enhanced by the company’s ability to hedge. If the company could not hedge, crediting features may be different to reflect the assets supporting the benefits. Ultimately the contract guarantees determine a company’s risk exposure, not simply the existence of a hedge.

The existence of a hedge should not be preclude a product from Exclusion Tests.

**Alternate Path**
The current version of APF 2020-12 should not be adopted without adjusting for the different nature between short-term index credit hedges, which can be very tightly matched, and long-term guarantee-focused hedges, which have more risk of mis-estimation. I recommend an additional hedge category (in addition to CDHS & SHS) that only utilizes best-efforts runs and qualifies for Exclusion Tests. This category can be defined as hedges supporting benefits with non-guaranteed elements.

Sincerely,

Ken Christy, Assistant Actuary
Allianz Life Insurance Company of North America
The Life Actuarial (A) Task Force met June 10, 2021. The following Task Force members participated: Doug Slape, Chair, represented by Mike Boerner, Rachel Hemphill, and Karen Jiang (TX); Judith L. French, Vice Chair, represented by Jason Wade (OH); Lori K. Wing-Heier represented by Sharon Comstock (AK); Jim L. Ridling represented by Jennifer Li and Steve Ostlund (AL); Ricardo Lara represented by Thomas Reedy and Perry Kupferman (CA); Michael Conway represented by Eric Unger (CO); Andrew N. Mais represented by Wanchin Chou (CT); Doug Ommen represented by Mike Yanacheak (IA); Dana Popish Severinghaus represented by Bruce Sartain and Vincent Tsang (IL); Vicki Schmidt represented by Nicole Boyd (KS); Grace Arnold represented by Fred Andersen and John Robinson (MN); Chlora Lindley-Myers represented by William Leung (MO); Eric Dunning represented by Rhonda Ahrens (NE); Marlene Caride represented by Dave Wolf (NJ); Linda A. Lacewell represented by Bill Carmello and Amanda Fenwick (NY); Glen Mulready represented by Andrew Schallhorn (OK); Jonathan T. Pike represented by Tomasz Serbinowski (UT); and Scott A. White represented by Craig Chupp (VA).

1. **Exposed Amendment Proposal 2021-10**

Angela McNabb (NAIC) said amendment proposal 2021-10 modifies the smoker status data element in Appendix 4 of VM-51, Experience Reporting Formats, to recognize the current smoker status instead of the smoker status at time of policy issuance.

Mr. Leung made a motion, seconded by Mr. Kupferman, to deem the amendment proposal non-substantive. The motion passed unanimously.

Mr. Leung made a motion, seconded by Ms. Ahrens, to expose amendment proposal 2021-10 (Attachment A) for a 10-day public comment period ending June 21. The motion passed unanimously.

2. **Extended the Public Comment Period for Amendment Proposal 2021-08**

Brian Bayerle (American Council of Life Insurers—ACLI) said the ACLI supports the Society of Actuaries (SOA) mortality table development efforts and understands its need to reflect as recent experience as possible. He said that considering the additional data elements expected in 2023 as part of the effort to support accelerated underwriting, adoption of the amendment proposal should be deferred. He said reducing the data lag now would stress the data submission process. Ms. Ahrens agreed that the adoption should be deferred until after the completion of this year’s data call.

Ms. Ahrens made a motion, seconded by Mr. Schallhorn, to extend the public comment period for amendment proposal 2021-08 (Attachment B) until June 15. The motion passed unanimously.

3. **Adopted Amendment Proposal 2020-10**

Mr. Carmello said the New York Department of Financial Services (NYDFS) comment letter (Attachment C) reiterates its position against allowing the use of future mortality improvement. He said the NYDFS believes that the $\frac{1}{2} \sigma_r$ is the appropriate reserve credit for yearly renewable term (YRT) reinsurance. Mr. Reedy said the California Department of Insurance (DOI) agrees with the position of the NYDFS. He specifically noted that given the impact of COVID-19, the timing is unusual for considering mortality improvement.

Ms. Hemphill said the amendment proposal allows for the Task Force adoption of mortality improvement in the future. She said the amendment proposal states that until the Task Force adopts factors, the mortality improvement factor is 0%. She said that the SOA will consider the impacts of COVID-19 in its factor development.

Mr. Wolf said the State of New Jersey Department of Banking and Insurance and the Arizona Department of Insurance and Financial Institutions support version 4 of the Section 8.C edits. He said they generally believe that grandfathering the YRT approach for policies issued prior to 2020 is appropriate for companies that have complied with existing regulatory requirements.
Ms. Hemphill recapped the four versions of edits to Section 8.C of VM-20, Requirements for Principle-Based Reserves for Life Products, designed to handle the 2017–2019 issue year carveout from the interim YRT solution, as provided in the proposal for commenters’ consideration. She detailed the differences between the approaches.

Ms. Ahrens said that while she understands Mr. Wolf’s position on grandfathering, there is precedence for the phase-in approach in version 3. She said the spirit of principle-based reserving (PBR) includes getting to more of an economic reserve basis for which the assumptions for old and new business are continually recalibrated. She expressed concern about proposals that segment the business and may require separate modeling. Mr. Leung said that because applying future mortality improvement results in a reserve reduction, he believes that makes other reserve credit methods inappropriate. Ms. Hemphill said phasing in the future mortality improvement avoids any double counting of the $ \frac{1}{2} c_x $ approach. Mr. Leung voiced his support for version 3.

Ms. Ahrens made a motion, seconded by Mr. Leung, to adopt amendment proposal 2020-10 (Attachment D) with version 3 of edits to Section 8.C of VM-20. The motion passed, with Mr. Carmello and Mr. Kupferman dissenting.

4. **Discussed Amendment Proposal 2019-33**

Mr. Chupp discussed his comment letter (Attachment E) on amendment proposal 2019-33 (Attachment F). Leonard Mangini (American Academy of Actuaries—Academy) said the Academy will accept Mr. Chupp’s editorial corrections, but his other comments will require further discussion. Mr. Boerner said the discussions will be continued during a future meeting.

Having no further business, the Life Actuarial (A) Task Force adjourned.

Amendment Proposal Form*

1. Identify yourself, your affiliation and a very brief description (title) of the issue.

Society of Actuaries Valuation Basic Table Team – Chair Larry Bruning

Revisions to VM-51 to allow for the data experience reporting observation calendar year to be one year prior to the reporting calendar year.

2. Identify the document, including the date if the document is “released for comment,” and the location in the document where the amendment is proposed:

3. Show what changes are needed by providing a red-line version of the original verbiage with deletions and identify the verbiage to be deleted, inserted or changed by providing a red-line (turn on “track changes” in Word®) version of the verbiage. (You may do this through an attachment.)

Section 2: Statistical Plan for Mortality

D. Process for Submitting Experience Data Under This Statistical Plan

Data for this statistical plan for mortality shall be submitted on an annual basis. Each company required to submit this data shall submit the data using the Regulatory Data Collection (RDC) online software submission application developed by the Experience Reporting Agent. For each data file submitted by a company, the Experience Reporting Agent will perform reasonability and completeness checks, as defined in Section 4 of VM-50, on the data. The Experience Reporting Agent will notify the company within 30 days following the data submission of any possible errors that need to be corrected. The Experience Reporting Agent will compile and send a report listing potential errors that need correction to the company.

Data for this statistical plan for mortality will be compiled using a calendar year method. The reporting calendar year is the calendar year of the experience data that is reported. The observation calendar year is the calendar year of the experience data that is reported. Revisions to VM-51 allow for the data experience reporting observation calendar year to be one year prior to the reporting calendar year. For example, if the current calendar year is 2022 and that is the reporting calendar year, the company is to report the experience data that was in-force or issued in calendar year 2021, which is the observation calendar year. For the 2022 reporting calendar year, companies that are required to submit data for this statistical plan for mortality will be required to submit two observation calendar years of data, namely observation calendar year 2020 and observation calendar year 2021. For reporting calendar years after 2022, companies that are required to submit data for this statistical plan for mortality will be required to submit one observation calendar year of data.

Given an observation calendar year of 20XX, the calendar year method requires reporting of experience data as follows:

i. Report policies in force during or issued during calendar year 20XX.
ii. Report terminations that were incurred in calendar year 20XX and reported before July 1, 20XX+1. However, exclude rescinded policies (e.g., 10-day free look exercises) from the data submission.

For any reporting calendar year, the data call will occur during July of that reporting calendar year, and data is to be submitted according to the requirements of the Valuation Manual in effect during that calendar year. For the 2022 reporting calendar year, the requirements of the 2022 Valuation Manual will be used for both the 2020 and 2021 observation years. Data submissions must be made by Sept. 30 of the reporting calendar year. Corrections of data submissions must be completed by Dec. 31 of the reporting calendar year.

4. State the reason for the proposed amendment? (You may do this through an attachment.)

This APF is needed for the following reasons:

1. There is a need to shorten the time period between data observation and data collection to facilitate more timely analysis and reporting of mortality experience.
2. Under a Principle Based Reserving methodology, valuation basic tables should reflect recent and current mortality experience.
NY remains opposed to the adoption of APF 2020-10. This APF, which would allow future mortality improvement to be reflected in the reserves regardless of any reinsurance, was developed to address an issue with the reserve credit for YRT reinsurance. This approach generally results in lower gross reserves for all business regardless if it is reinsured. Mortality improvement through the valuation date may be incorporated but any future improvement that has not yet occurred should not be permitted within the reserves. Currently a reserve credit of just 1/2Cx is permitted for YRT reinsurance and most of the reinsurance reserve credit requirements do not apply. Allowing a credit greater than such amount may result in an inappropriate reserve credit and a distorted balance sheet. During the development of PBR it was decide that the current reinsurance rules would continue under PBR which would include those applicable for YRT reserve credit.

Amendment Proposal Form

1. Identify yourself, your affiliation and a very brief description (title) of the issue.

Reflect a prudent level of mortality improvement beyond the valuation date.

2. Identify the document, including the date if the document is “released for comment,” and the location in the document where the amendment is proposed:

3. Show what changes are needed by providing a red-line version of the original verbiage with deletions and identify the verbiage to be deleted, inserted or changed by providing a red-line (turn on “track changes” in Word®) version of the verbiage. (You may do this through an attachment.)

See attached Appendix.

4. State the reason for the proposed amendment? (You may do this through an attachment.)

We propose to reflect a prudent level of mortality improvement beyond the valuation date, using SOA analysis for best estimate future mortality improvement and margin. The requirements also need to be clarified for the handling of historical or anticipated future mortality deterioration (i.e., negative improvement).

With the reflection of a prudent level of future mortality improvement in the mortality assumption, the interim 1/2cx approach to YRT is a reasonable consideration for a long-term approach.

For LATF consideration for re-exposure, there are four versions of the handling of the 2017-2019 issue year carveout from the interim YRT solution: 1) the original exposure, removing the carveout with the 1/2cx being made a longer term approach, 2) a modified version that removes the carveout, but makes that removal contingent on the first set of SOA future mortality rates being adopted, in case of delay, 3) a modified version that removes the carveout, but allows for a phase-in of the effect of this change, and 4) a version making the carveout long-term. These versions are presented starting on Page 6 of this document, after the other edits which do not vary based on this options.
Appendix

VM-20 Section 6.A.2.b.v:

v. **Anticipated mortality improvement beyond the projection start date shall be reflected in the** mortality assumption for the purpose of calculating the stochastic exclusion ratio. **The future mortality improvement factors shall be no greater than the unloaded factors determined by the SOA, adopted by LATF, and published on the SOA website, at [link/reference to SOA site TBD].**

**Guidance Note:** Mortality improvement may be positive or negative (i.e., deterioration). The anticipated mortality improvement may be lower than the rates published by the SOA, for example, if the company’s best estimate for mortality improvement for a particular block, such as simplified issue, is lower. Prior to adoption by LATF of the first set of future mortality improvement factors, the future mortality improvement rates shall be 0%.

To allow time for companies to reflect the updated mortality improvement rates, the rates that are to be used in the year-end YYYY valuation should be adopted by LATF and published on the SOA website by September of YYYY. If this timeline is not met, then at the company’s option they may use the mortality improvement rates for the prior year (year YYYY-1).

VM-20 Section 9.C.2.h:

h. **Mortality improvement shall not be incorporated beyond the valuation date in the company experience mortality rates. However, historical mortality improvement from the central point of the underlying company experience data to the valuation date may be incorporated.**

**Guidance Note:** Future mortality improvement is not applied to the company experience mortality rates, since it would be duplicative of the future mortality improvement that is applied to the prudent estimate assumptions for mortality in Section 9.C.7.f.

VM-20 Section 9.C.3.g:

g. **Mortality improvement shall not be incorporated beyond the valuation date in the industry basic table. However, historical mortality improvement from the date of the industry basic table (e.g., Jan. 1, 2008, for the 2008 VBT and July 1, 2015, for the 2015 VBT) to the valuation date shall be incorporated using the improvement factors for the applicable industry basic table as determined by the SOA, adopted by LATF, and published on the SOA website, https://www.soa.org/research/topics/indiv-val-exp-study-list/ (Mortality Improvement Rates for AG-38 for Year-End YYYY).**

**Guidance Note:** Future mortality improvement is not applied to the industry basic table, since it would be duplicative of the future mortality improvement that is applied to the prudent estimate assumptions for mortality in Section 9.C.7.f.
To allow time for companies to reflect the updated mortality improvement rates, the rates that are to be used in the year-end YYYY valuation should be adopted by LATF and published on the SOA website by September of YYYY. If this timeline is not met, then at the company’s option they may use the most recent set of prior mortality improvement rates adopted by LATF and published on the SOA website.

VM-20 Section 9.C.7.a:
If applicable industry basic tables are used in lieu of company experience as the anticipated experience assumptions, or if the level of credibility of the data as provided in Section 9.C.5 is less than 20%, the prudent estimate assumptions for each mortality segment shall equal the respective mortality rates in the applicable industry basic tables as provided in Section 9.C.3, adjusted as necessary pursuant to Section 9.C.7.c and/or any applicable improvement pursuant to Section 9.C.3.g, plus the prescribed margin as provided in Section 9.C.6.c, plus any applicable additional margin pursuant to Section 9.C.6.d.v and/or Section 9.C.6.d.vi, future mortality improvement, pursuant to Section 9.C.7.f, shall be applied to the prudent estimate assumption for mortality.

Section 9.C.7.b.vi:
Beginning in the first policy duration after policy duration E, the prudent estimate mortality assumptions for each policy in a given mortality segment are determined as a weighted average of the company experience mortality rates with margins and the applicable industry basic table with margins, in which the weights on the company rates grade linearly from 100% down to 0%. This grading must be completed—i.e., must reach 100% of industry table—no later than the beginning of the first policy duration after policy duration Z (the determination of the applicable industry basic table is described in Section 9.C.3). Thus, the prudent estimate mortality rate, prior to any adjustments pursuant to Sections 9.C.7.c, 9.C.7.d, 9.C.7.e, and 9.C.7.f below, is:

VM-20 Section 9.C.7.f (new section):

Twenty years of future mortality improvement that the company anticipates beyond the valuation date shall be applied to the prudent estimate assumptions for mortality, using prudent future mortality improvement factors no greater than the loaded factors determined by the SOA, adopted by LATF, and published on the SOA website, at [link/reference to SOA site TBD].

Guidance Note: Mortality improvement may be positive or negative (i.e., deterioration). The anticipated mortality improvement may be lower than the rates published by the SOA, even zero, for example, if the company’s best estimate for mortality improvement for a particular block, such as simplified issue, is lower. Prior to adoption by LATF of the first set of future mortality improvement factors, the future mortality improvement rates shall be 0%.

To allow time for companies to reflect the updated mortality improvement rates, the rates that are to be used in the year-end YYYY valuation should be adopted by LATF and published on the SOA website by September of YYYY. If this timeline is not met, then at the company’s option they may use the mortality improvement rates for the prior year (year YYYY-1).
VM-31 Section 3.D.3.i:

i. **Mortality Improvement** – Description of and rationale for the mortality improvement assumptions applied up to the valuation date and the mortality improvement assumptions applied beyond the valuation date. Such a description shall include the assumed start and end dates of the improvements and a table of the annual improvement percentage(s) used, both without and with margin, separately for company experience and the industry basic table(s), along with a sample calculation of the adjustment (e.g., for a male preferred nonsmoker age 45).

VM-31 Section 3.D.11.c.i:

i. If the company believes the method used to determine anticipated experience mortality assumptions includes an implicit margin, the company can adjust the anticipated experience assumptions to remove this implicit margin for this reporting purpose only. If any such adjustment is made, the company shall document the rationale and method used to determine the anticipated experience assumption.
2017-2019 for Long-Term YRT – Version 1:

VM-20 Section 8.C, introductory paragraph:

C. Reflection of Reinsurance Cash Flows in the Deterministic Reserve or Stochastic Reserve

For non-guaranteed YRT reinsurance ceded or assumed, the cash-flow modeling requirements in Sections 8.C.1 through 8.C.14 below do not apply since non-guaranteed YRT reinsurance ceded or assumed does not need to be modeled; see Section 8.C.18 below. YRT shall include other reinsurance arrangements that are similar in effect to YRT.

VM-20 Section 8.C.18 and Guidance Note:

18. When the reinsurance ceded or assumed is on a non-guaranteed YRT or similar basis, the corresponding reinsurance cash flows do not need to be modeled. Rather, for a ceding company, the post-reinsurance-ceded DR or SR shall be the pre-reinsurance-ceded DR or SR pursuant to Section 8.D.2, plus any applicable provision pursuant to Section 8.C.15 and Section 8.C.17, minus the NPR reinsurance credit from Section 8.B. For an assuming company, the DR or SR for the business assumed on a non-guaranteed YRT or similar basis shall be set equal to the NPR from Section 3.B.8, plus any applicable provision pursuant to Section 8.C.16 and Section 8.C.17. In the case where there are also other reinsurance arrangements that are not on a non-guaranteed YRT or similar basis, the reinsurance credit shall include the modeled reinsurance credit reflecting those other reinsurance arrangements. In particular, where there are also other reinsurance arrangements that are dependent on the non-guaranteed YRT or similar actuarial judgment shall be used to project cash flows consistent with the above outlined treatment for non-guaranteed YRT or similar arrangements.

Deleted: For policies issued on or after Jan. 1, 2020, and
optionally for policies issued on or after Jan. 1, 2017, and before Jan.
1, 2020.

Deleted: For policies issued on or after Jan. 1, 2020, and
optionally for policies issued on or after Jan. 1, 2017, and before Jan.
1, 2020.

Deleted: Guidance Note: The above method is an interim
approach. A longer-term solution to YRT is intended to be
adopted by state insurance regulators, after state insurance
regulators and industry have had additional time to consider and
evaluate the variety of approaches that have been put forward as a
potential longer-term solution.

© 2021 National Association of Insurance Commissioners
2017-2019 for Long-Term YRT – Version 2:

VM-20 Section 8.C, introductory paragraph:

C. Reflection of Reinsurance Cash Flows in the Deterministic Reserve or Stochastic Reserve

For policies issued on or after Jan. 1, 2020, and optionally for policies issued on or after Jan. 1, 2017, and before Jan. 1, 2020 up until adoption by LATF of the first set of unloaded future mortality improvement factors, at which point this shall apply for all policies issued on or after Jan. 1, 2017:

For non-guaranteed YRT reinsurance ceded or assumed, the cash-flow modeling requirements in Sections 8.C.1 through 8.C.14 below do not apply since non-guaranteed YRT reinsurance ceded or assumed does not need to be modeled, see Section 8.C.18 below. YRT shall include other reinsurance arrangements that are similar in effect to YRT.

VM-20 Section 8.C.18 and Guidance Note:

18. For policies issued on or after Jan. 1, 2020, and optionally for policies issued on or after Jan. 1, 2017, and before Jan. 1, 2020 up until adoption by LATF of the first set of unloaded future mortality improvement factors, at which point this shall apply for all policies issued on or after Jan. 1, 2017:

When the reinsurance ceded or assumed is on a non-guaranteed YRT or similar basis, the corresponding reinsurance cash flows do not need to be modeled. Rather, for a ceding company, the post-reinsurance-ceded DR or SR shall be the pre-reinsurance-ceded DR or SR pursuant to Section 8.D.2, plus any applicable provision pursuant to Section 8.C.15 and Section 8.C.17, minus the NPR reinsurance credit from Section 8.B. For an assuming company, the DR or SR for the business assumed on a non-guaranteed YRT or similar basis shall be set equal to the NPR from Section 3.B.8, plus any applicable provision pursuant to Section 8.C.16 and Section 8.C.17. In the case where there are also other reinsurance arrangements that are not on a non-guaranteed YRT or similar basis, the reinsurance credit shall include the modeled reinsurance credit reflecting those other reinsurance arrangements. In particular, where there are also other reinsurance arrangements that are dependent on the non-guaranteed YRT or similar actuarial judgment shall be used to project cash flows consistent with the above outlined treatment for non-guaranteed YRT or similar arrangements.

The above method is an interim approach. A longer-term solution to YRT is intended to be adopted by state insurance regulators, after state insurance regulators and industry have had additional time to consider and evaluate the variety of approaches that have been put forward as a potential longer-term solution.
2017-2019 for Long-Term YRT – Version 3:

C. Reflection of Reinsurance Cash Flows in the Deterministic Reserve or Stochastic Reserve

For non-guaranteed YRT reinsurance ceded or assumed, the cash-flow modeling requirements in Sections 8.C.1 through 8.C.14 below do not apply since non-guaranteed YRT reinsurance ceded or assumed does not need to be modeled; see Section 8.C.18 below. YRT shall include other reinsurance arrangements that are similar in effect to YRT.

For policies issued on or after Jan. 1, 2017, and before Jan. 1, 2020, the company may elect, with domiciliary commissioner approval, a phase-in of the current methodology for non-guaranteed YRT reinsurance with allowance for future mortality improvement from the methodology in the 2021 Valuation Manual for non-guaranteed YRT reinsurance without allowance for future mortality improvement, provided that the company uses a weighted average of the results from the two methodologies, with the weight for the prior methodology being no more than (20XX-YYYY)/(20XX-2021), where YYYY is the current valuation year and 20XX is the final year of the phase-in. A company may elect to phase in these requirements over a 3-year period beginning Jan. 1, 2022 and ending Dec. 31, 2024. A company may elect a longer phase-in period of up to seven years beginning Jan. 1, 2022 and ending Dec. 31, 2028, with approval of the domiciliary commissioner.

VM-20 Section 8.C.18 and Guidance Note:

18. When the reinsurance ceded or assumed is on a non-guaranteed YRT or similar basis, the corresponding reinsurance cash flows do not need to be modeled. Rather, for a ceding company, the post-reinsurance-ceded DR or SR shall be the pre-reinsurance-ceded DR or SR pursuant to Section 8.D.2, plus any applicable provision pursuant to Section 8.C.15 and Section 8.C.17, minus the NPR reinsurance credit from Section 8.B. For an assuming company, the DR or SR for the business assumed on a non-guaranteed YRT or similar basis shall be set equal to the NPR from Section 3.B.8, plus any applicable provision pursuant to Section 8.C.16 and Section 8.C.17. In the case where there are also other reinsurance arrangements that are not on a non-guaranteed YRT or similar basis, the reinsurance credit shall include the modeled reinsurance credit reflecting those other reinsurance arrangements. In particular, where there are also other reinsurance arrangements that are dependent on the non-guaranteed YRT or similar actuarial judgment shall be used to project cash flows consistent with the above outlined treatment for non-guaranteed YRT or similar arrangements.

For policies issued on or after Jan. 1, 2017, and before Jan. 1, 2020, the company may elect, with domiciliary commissioner approval, a phase-in of the current methodology for non-guaranteed YRT reinsurance with allowance for future mortality improvement from the methodology in the 2021 Valuation Manual for non-guaranteed YRT reinsurance without allowance for future mortality improvement, provided that the company uses a weighted average of the results from the two methodologies, with the weight for the prior methodology being no more than (20XX-YYYY)/(20XX-2021), where YYYY is the
current valuation year and 20XX is the final year of the phase-in. A company may elect to phase in these requirements over a 3-year period beginning Jan. 1, 2022 and ending Dec. 31, 2024. A company may elect a longer phase-in period of up to seven years beginning Jan. 1, 2022 and ending Dec. 31, 2028, with approval of the domiciliary commissioner.

VM-31 Section 3.D.8.g (new):

g. Phase-In: If electing a phase-in period as described in VM-20 Section 8.C, documentation of the length of the phase-in approved by the company’s domiciliary commissioner, the result of the current and prior methodologies, the weights applied to each result, and confirmation that reinsurance assumptions for the calculation of the prior methodology are discussed in Section 3.D.8.b above.
2017-2019 for Long-Term YRT – Version 4:

C. Reflection of Reinsurance Cash Flows in the Deterministic Reserve or Stochastic Reserve

For policies issued on or after Jan. 1, 2020, and optionally for policies issued on or after Jan. 1, 2017, and before Jan. 1, 2020:

For non-guaranteed YRT reinsurance ceded or assumed, the cash-flow modeling requirements in Sections 8.C.1 through 8.C.14 below do not apply since non-guaranteed YRT reinsurance ceded or assumed does not need to be modeled; see Section 8.C.18 below. YRT shall include other reinsurance arrangements that are similar in effect to YRT.

VM-20 Section 8.C.18 and Guidance Note:

18. For policies issued on or after Jan. 1, 2020, and optionally for policies issued on or after Jan. 1, 2017, and before Jan. 1, 2020:

When the reinsurance ceded or assumed is on a non-guaranteed YRT or similar basis, the corresponding reinsurance cash flows do not need to be modeled. Rather, for a ceding company, the post-reinsurance-ceded DR or SR shall be the pre-reinsurance-ceded DR or SR pursuant to Section 8.D.2, plus any applicable provision pursuant to Section 8.C.15 and Section 8.C.17, minus the NPR reinsurance credit from Section 8.B. For an assuming company, the DR or SR for the business assumed on a non-guaranteed YRT or similar basis shall be set equal to the NPR from Section 3.B.8, plus any applicable provision pursuant to Section 8.C.16 and Section 8.C.17. In the case where there are also other reinsurance arrangements that are not on a non-guaranteed YRT or similar basis, the reinsurance credit shall include the modeled reinsurance credit reflecting those other reinsurance arrangements. In particular, where there are also other reinsurance arrangements that are dependent on the non-guaranteed YRT or similar actuarial judgment shall be used to project cash flows consistent with the above outlined treatment for non-guaranteed YRT or similar arrangements.

Deleted: Guidance Note: The above method is an interim approach. A longer-term solution to YRT is intended to be adopted by state insurance regulators, after state insurance regulators and industry have had additional time to consider and evaluate the variety of approaches that have been put forward as a potential longer-term solution.
Please allow me to submit the following comments regarding exposure APF 2019-33:

1. The word “in” should be inserted in subsection 1.F.2 as follows:

   “Business not described in subsection 1.D. otherwise...”

2. Footnote 1 at the bottom of subsection 1 in the VM is no longer needed and should be deleted.

3. In the Guidance Note under VM-20 Section 1.B.1, the third sentence reads awkward. I suggest the following wording:

   “Group insurance where the underwriting is based on the characteristics of the group and census data but where some individuals are subjected to individual risk selection...”

4. Under VM-20 Section 1.B.2, does “coverage amount” mean that the premiums or COI schedules are banded by face amount? Or does “coverage amount” simply mean that the premium or COI charges must be multiplied by the number of units or number of thousands of coverage to obtain the total premium or COI charge? Since the word “schedules” is used, it would seem to imply that the premiums or COI charges must be banded in order for the individual certificates to fall under VM-20 requirements. The word “schedules” would seem to imply that the premiums or COI charges are per unit of coverage or are per $1000. What if the premium schedule per unit or COI charges per $1000 are based on some but not all of these characteristics (issue age, duration, coverage amount, risk class)? For example, say the COI charges are based on issue age, duration and risk class, but not coverage amount (that is, they are not banded). The wording would seem to exclude these individual certificates from VM-20 requirements even though the COI charges vary by issue age, duration and risk class. Is this the intention?

Thank you.

Amendment Proposal Form*

1. Identify yourself, your affiliation and a very brief description (title) of the issue.
   
   American Academy of Actuaries, Life Reserves Work Group
   
   Addition of language to clarify the definition of individually underwritten life insurance and the
   applicability of Principle-Based Reserve (PBR) requirements for group insurance contracts with individual
   risk selection issued under insurance certificates.

2. Identify the document, including the date if the document is “released for comment,” and the location in
   the document where the amendment is proposed:
   
   January 1, 2021, version of the Valuation Manual, with the revisions to APF 2020-11 (adopted by LATF
   on 2/11/21) shown in blue text.

3. Show what changes are needed by providing a red-line version of the original verbiage with deletions and
   identify the verbiage to be deleted, inserted or changed by providing a red-line (turn on “track changes” in
   Word®) version of the verbiage. (You may do this through an attachment.)
   
   See Appendix
   
   All proposed changes specific to this amendment proposal are shown in red text.

4. State the reason for the proposed amendment? (You may do this through an attachment.)
   
   Individual insurance certificates issued under a group contract which utilize an individual risk selection
   process, pricing, premium rate structures and product features are similar to individual life insurance
   policies. They are currently excluded from VM-20 because they are filed under a group contract, but they
   should be subject to VM-20 due to this similarity. See Appendix.

* This form is not intended for minor corrections, such as formatting, grammar, cross-references or spelling. Those
   types of changes do not require action by the entire group and may be submitted via letter or email to the NAIC
   staff support person for the NAIC group where the document originated.

Notes: APF 2019-33
Appendix

Issue

Certain contracts issued under a master group contract require individual risk selection in order to qualify for issuance of the group insurance certificate; the certificates have similar acquisition approaches, provisions, certificate-holder rights, pricing, and risk classification; and they are managed in a similar manner as individual ordinary life insurance contracts. These individual certificates should follow the same reserve requirements as other individual life contracts of the same product type. Therefore, a change is needed within the *Valuation Manual* to bring these individual certificates into scope of VM-20.

Six changes are recommended:

1) Within the Reserve Requirements section (Section II), change the minimum reserve requirements to also apply to group life contracts which, other than the difference between issuing a policy and issuing a group certificate, have the same or mostly similar contract provisions, risk selection process, and underwriting as individual ordinary life contracts (Section II, subsection 1.D);

2) Within the Reserve Requirements section (Section II), add a transition period for individual group certificates issued on or before 1/1/2024 (Section II, subsections 1.F.1 and 1.F.2);

3) Within the Reserve Requirements section (Section II), add language and guidance note to subsection 1.G and the corresponding footnote to include premiums from group life contracts which have individual certificates that were issued using individual risk selection processes (Section II, subsection 1.G.1, footnote, and guidance note) and to clarify the Calculation for Exemption (Section II, subsection 1.G.2). Comment notes need to refer to NAIC Blanks (E) Working Group to update the PBR Supplement;

4) Add new paragraph, VM-20 Section 1.B (and reformat to make current paragraph Section 1.A) to clarify group life certificates issued using individual risk selection processes, including a definition and requirements to be met, are subject to the requirements of VM-20;

5) Add guidance note after first sentence in VM-20 Section 2.A.1 that group life certificates that meet the definition for individual risk selection process use the same VM-20 Reserving Categories as defined in Section 2;

6) Draft referral to the NAIC Blanks (E) Working Group to revise the VM-20 Reserves Supplement, Part 2 to report premiums for total Group Life and Group Life with certificates subjected to an individual risk selection process and which meet all of the conditions as defined in VM-20 Section 1.B separately.
VM Changes 1, 2 and 3 – II. Reserve Requirements

II. Reserve Requirements

This section provides the minimum reserve requirements by type of product, as set forth in the seven subsections below, as follows:

1. Life Insurance Products
2. Annuity Products
3. Deposit-Type Contracts
4. Health Insurance Products
5. Credit Life and Disability Products
6. Riders and Supplemental Benefits
7. Claim Reserves

All reserve requirements provided by this section relate to business issued on or after the operative date of the Valuation Manual. All reserves must be developed in a manner consistent with the requirements and concepts stated in the Overview of Reserve Concepts in Section I of the Valuation Manual.

Guidance Note: The terms “policies” and “contracts” are used interchangeably.

Subsection 1: Life Insurance Products

A. This subsection establishes reserve requirements for all contracts issued on and after the operative date of the Valuation Manual that are classified as life contracts as defined in SSAP No. 50 in the AP&P Manual, with the exception of annuity contracts and credit life contracts. Minimum reserve requirements for annuity contracts and credit life contracts are provided below in subsection 2 and subsection 5, respectively.

B. Minimum reserve requirements for variable and nonvariable individual life contracts—excluding guaranteed issue life contracts, preneed life contracts, industrial life contracts, and policies of companies exempt pursuant to the life PBR exemption in paragraph D below—subsection 1.G are provided by VM-20, Requirements for Principle-Based Reserves for Life Products, except for election of the transition period in paragraph C below subsection 1.F.2 below. For this purpose, joint life policies are considered individual life.

C. Minimum reserve requirements of VM-20 are considered principle-based valuation requirements for purposes of the Valuation Manual.

D. Minimum reserve requirements for individual certificates under group life contracts which meet all the requirements in VM-20 Section 1.B are provided by VM-20, except for election of the transition period in subsection 1.F.1 below.

E. Minimum reserve requirements for life contracts not subject to VM-20 are those pursuant to applicable requirements in VM-A and VM-C. For guaranteed issue life contracts issued after Dec. 31, 2018, mortality tables are defined in VM Appendix M, Mortality Tables (VM-M), and the same table shall be used for reserve requirements as is used for minimum nonforfeiture requirements as defined in VM-02, Minimum Nonforfeiture Mortality and Interest.
F. A company may elect to establish minimum reserves pursuant to applicable requirements in VM-A and VM-C for:

1. Business described in subsection 1.D above and issued on or after the operative date of the Valuation Manual and prior to 1/1/2024.

2. Business not described in subsection 1.D otherwise subject to VM-20 requirements and issued during the first three years following the operative date of the Valuation Manual.

A company electing to establish reserves using the requirements of VM-A and VM-C may elect to use the 2017 Commissioners’ Standard Ordinary (CSO) Tables as the mortality standard following the conditions outlined in VM-20 Section 3. If a company during the three years elects to apply VM-20 to a block of such business, then a company must continue to apply the requirements of VM-20 for future issues of this business.

G. Life PBR Exemption

1. A company meeting the at least one of the conditions in Dsubsection 1.G.2 below may file a statement of exemption for individual ordinary life insurance policies and certificates, except for policies in Dsubsection 1.G.3 below, issued directly or assumed during the current calendar year, that would otherwise be subject to VM-20. If a company has no business issued directly or assumed during the current calendar year that would otherwise be subject to VM-20, a statement of exemption is not required. For a filed statement of exemption, the statement must be filed with the domiciliary commissioner prior to July 1 of that year certifying that at least one of the two conditions in Dsubsection 1.G.2 was met and the statement of exemption must also be included with the NAIC filing for the second quarter of that year.

The domiciliary commissioner may reject such statement prior to September 1 and require the company to follow the requirements of VM-20 for the ordinary life policies covered by the statement.

If a filed statement of exemption is not rejected by the domiciliary commissioner, the filing of subsequent statements of exemption is not required as long as the company continues to qualify for the exemption; rather, ongoing statements of exemption for each new calendar year will be deemed to not be rejected, unless: 1) the company does not meet either condition in Dsubsection 1.G.2 below; 2) the policies contain those in Dsubsection 1.G.3 below; or 3) the domiciliary commissioner contacts the company prior to Sept. 1 and notifies them that the statement of exemption is rejected. If any of these three events occur, then the statement of exemption for the current calendar year is rejected and a new statement of exemption must be filed and not rejected in order for the company to exempt additional policies. In the case of an ongoing statement of exemption, rather than include a statement of exemption with the NAIC filing for the second quarter of that year, the company should enter “SEE EXPLANATION” in response to the Life PBR Exemption supplemental interrogatory and provide as an explanation that the company is utilizing an ongoing statement of exemption.

2. Condition for Exemption:

The company has less than $300 million of ordinary life exemption premiums, and if the company is a member of an NAIC group of life insurers, which includes other life insurance companies, the group has combined ordinary life exemption premiums of less than $600 million; or

The only new policies that would otherwise be subject to VM-20 being issued or assumed by the company are due to election of policy benefits or features from existing policies valued under VM-A and VM-C and the company was exempted from, or otherwise not subject to, the requirements of VM-20 in the prior year.

Exemption premium is determined as follows:
a. The amount reported in the prior calendar year life/health annual statement, Exhibit 1, Part 1, Column 3 (“Ordinary Life Insurance”), line 20.1; plus
b. The portion of the amount in the prior calendar year life/health annual statement, Exhibit 1, Part 1, Column 3 (“Ordinary Life Insurance”), line 20.2 assumed from unaffiliated companies; minus
c. Amounts included in either (a) or (b) that are associated with guaranteed issue insurance policies and/or preneed life insurance policies; minus
d. Amounts included in either (a) or (b) that represent transfers of reserves in force as of the effective date of a reinsurance assumed transaction; plus
e. Amounts of premium for individual life certificates issued under a group life certificate which meet the conditions defined in VM-20, Section 1.B, and that are not included in either (a) or (b).

Guidance Note:
(i) Definitions of preneed and guaranteed issue insurance policy are in VM-01.
(ii) For statements of exemption filed for calendar year 2022 and beyond, the amount in subsection 2.e was reported in the prior calendar year life/health annual statement, VM-20 Reserve Supplement, Part 2, if applicable.

3. Policies Excluded from the Life PBR Exemption:
   a. Universal life with secondary guarantee (ULSG) policies, or policies – other than ULSG – that contain a rider with a secondary guarantee, in which the secondary guarantee does not meet the VM-01 definition of a “non-material secondary guarantee.”

4. Each exemption, or lack of an exemption, outlined in D. subsection 1.G.1 – D. subsection 1.G.3 above applies only to policies issued or assumed in the current year, and it applies to all future valuation dates for those policies. However, if policies did not qualify for the Life PBR Exemption during the year of issue but would have qualified for the Life PBR Exemption if the current Valuation Manual requirements had been in effect during the year of issue, then the domiciliary commissioner may allow an exemption for such policies. The minimum reserve requirements for the ordinary life policies subject to the exemption are those pursuant to applicable methods required in VM-A and VM-C using the mortality as defined in VM-20 Section 3.C.1 and VM-M Section 1.H.

VM Change 4 – VM-20: Requirements for Principle-Based Reserves for Life Products

VM-20: Requirements for Principles-Based Reserves for Life Products

Section 1: Purpose

A. These requirements establish the minimum reserve valuation standard for individual life insurance policies issued on or after the operative date of the Valuation Manual and subject to a principle-based valuation with an NPR floor under Model #820. These requirements constitute the Commissioners Reserve Valuation Method (CRVM) for policies of individual life insurance.
B. Individual life certificates under a group life contract shall be subject to the requirements of VM-20 if all of the following are met. These requirements constitute the Commissioners Reserve Valuation Method (CRVM) for such certificates.

1. An individual risk selection process, defined as follows, is used to obtain group life insurance coverage;

An individual risk selection process is one that is based on characteristics of the insured(s) beyond sex, gender, age, tobacco usage, and membership in a particular group. This may include, but is not limited to, completion of an application (beyond acknowledgement of membership to the group, sex, gender and age), questionnaire(s), online health history or tele-interview to obtain non-medical and medical or health history information, prescription history information, avocations, usage of tobacco, family history, or submission of fluids such as blood, Home Office Specimens (HOS), or oral fluid. The resulting risk classification is determined based on the characteristics of the individual insured(s) rather than the group, if any, of which it is a member (e.g., employer, affinity, etc.). The individual certificate holder is charged a premium rate based solely on the individual risk selection process and not on membership in a specific group.

**Guidance Note:** The use of evidence of insurability does not by itself constitute an individual risk selection process. Use of information obtained from a census or questionnaire regarding gender, occupation, age, income and/or tobacco usage solely for purposes of determining a rate classification does not by itself qualify a group as having used an individual risk selection process. Group insurance where the underwriting based on the characteristics of the group and census data but where some individuals are subjected to individual risk selection as a result of compensation level, age, an existing medical condition or impairment, late entry into the group, failure of the group to meet minimum participation requirements or voluntary buy-up of increased coverage does not meet the definition of an individual risk selection process.

2. The individual certificates utilize premiums or cost of insurance schedules and charges based on the individual applicant’s issue age, duration from underwriting, coverage amount and risk classification and there is a stated or implied schedule of maximum gross premiums or net cash surrender value required in order to continue coverage in force for a period in excess of one year;

3. The group master contract is designed, priced, solicited, and managed similar to individual ordinary life insurance policies rather than specific to the group as a whole;

4. The individual certificates have similar acquisition approaches, provisions, certificate-holder rights, pricing, and risk classification to individual ordinary life insurance contracts.

5. The individual certificates are issued on or after the operative date of the Valuation Manual except election of the transition period in Section 2, subsection 1.F.1.

VM Change 5 - VM-20: Requirements for Principle-Based Reserves for Life Products

Section 2: Minimum Reserve

A. All policies subject to these requirements shall be included in one of the VM-20 Reserving Categories, as specified in Section 2.A.1, Section 2.A.2 and Section 2.A.3 below.

Guidance Note: Since group insurance subject to an individual risk selection process and meeting all the requirements in Section 1.B is subject to VM-20 requirements, Section 2.A shall apply—meaning that any such contracts will be included in one of the VM-20 Reserving Categories defined by Section 2.A.1, Section 2.A.2, and 2.A.3. All requirements in VM-31 which apply to a VM-20 Reserving Category shall apply to any group insurance subject to individual risk selection that has been included in that VM-20 Reserving Category.

The company may elect to exclude one or more groups of policies from the stochastic reserve calculation and/or the deterministic reserve calculation. When excluding a group of policies from a reserve calculation, the company must document that the applicable exclusion test defined in Section 6 is passed for that group of policies. The minimum reserve for each VM-20 Reserving Category is defined by Section 2.A.1, Section 2.A.2 and Section 2.A.3, and the total minimum reserve equals the sum of the Section 2.A.1, Section 2.A.2 and Section 2.A.3 results below, defined as:
Refer to NAIC Blanks (E) Working Group, request for modification to the supplemental report for the Life PBR Exemption, to show the premiums for group life that utilized an individual risk selection process and meets all of the requirements in VM-20 Section 1.B. as these premiums are currently grouped together with other group insurance in Exhibit 1. As there are other instances where the ordinary life premiums are not included in the determination of the Life PBR Exemption (e.g., for guaranteed issue policies), it may be useful to request addition of the breakdown of premiums used to determine the exemption.

Possible insertion between questions 1 and 2 for disclosure of premiums used in the determination of eligibility for the Life PBR exemption, split by ordinary life and group subject to an individual risk selection process and meeting all of the requirements in VM-20 Section 1.B.

The Life Actuarial (A) Task Force met May 27, 2021. The following Task Force members participated: Doug Slape, Chair, represented by Mike Boerner, Rachel Hemphill, and Karen Jiang (TX); Judith L. French, Vice Chair, represented by Jason Wade (OH); Lori K. Wing-Heier represented by Sharon Comstock (AK); Jim L. Ridling represented by Jennifer Li and Steve Ostlund (AL); Ricardo Lara represented by Ben Bock and Perry Kupferman (CA); Michael Conway represented by Eric Unger (CO); Andrew N. Mais represented by Wanchin Chou (CT); Doug Ommen represented by Mike Yanacheak (IA); Dana Popish Severinghaus represented by Bruce Sartain and Vincent Tsang (IL); Stephen W. Robertson represented by Karl Knable (IN); Grace Arnold represented by Fred Andersen and John Robinson (MN); Chlora Lindley-Myers represented by William Leung (MO); Eric Dunning represented by Rhonda Ahrens (NE); Marlene Caride represented by Kevin Clarkson (NJ); Linda A. Lacewell represented by Bill Carmello and Amanda Fenwick (NY); Glen Mulready represented by Andrew Schallhorn (OK); Jonathan T. Pike represented by Tomasz Serbinowski (UT); Scott A. White represented by Craig Chupp (VA); and James A. Dodrill represented by Joylynn Fix (WV).

1. **Re-Exposed Amendment Proposal 2021-09**

Ms. Hemphill said amendment proposal 2021-09 addresses the determination of materiality and the use of simplifications and approximations in a new VM-21, Requirements for Principle-Based Reserves for Variable Annuities. She said the proposed changes require the addition of a new paragraph to VM-21 Section 1, a new paragraph to VM-21 Section 3, and two revisions to Section 3 of VM-31, PBR Actuarial Report Requirements for Business Subject to a Principle-Based Valuation. Connie Tang (Prudential) asked if simplifications related to hedge modeling will require additional demonstrations of the materiality. Ms. Hemphill said those simplifications should be covered by the back-testing documentation.

Mr. Chou made a motion, seconded by Mr. Leung, to re-expose amendment proposal 2021-09 (Attachment A) for a 21-day public comment period ending June 16. The motion passed unanimously.

2. **Re-Exposed Amendment Proposal 2020-10**

Ms. Hemphill said amendment proposal 2020-10 recommends reflecting a prudent level of mortality improvement beyond the valuation date. She noted that reflecting a prudent level of future mortality improvement in the mortality assumption makes the interim $\frac{1}{2}$ $c_x$ approach for determining the yearly renewable term (YRT) reinsurance reserve credit a reasonable consideration for a long-term approach for determining the reserve credit. She said four versions of edits to Section 8.C of VM-20, Requirements for Principle-Based Reserves for Life Products, designed to handle the 2017-2019 issue year carveout from the interim YRT solution, are provided in the proposal for commenters’ consideration. She discussed the details of the differences between the approaches.

Mr. Chupp said the edits in the revised amendment proposal address most of the issues raised in his comment letter (Attachment B). Sheldon Summers (Claire Thinking Inc.), said his comments (Attachment C) represent his own thoughts and not those of his organization. He said using the $\frac{1}{2}$ $c_x$ approach as the long-term solution may result in understated reserves for some companies. He said there are situations for which the ceding company should model the YRT reinsurance cash flows, using the $\frac{1}{2}$ $c_x$ as the reserve credit cap, and there are situations for which the assuming company should model the YRT reinsurance cash flows, with the $\frac{1}{2}$ $c_x$ as the reserve credit floor. Ms. Hemphill suggested addressing that issue in a separate amendment proposal.

Sharon Brody (Prudential) and Catherine Murphy (John Hancock) discussed the comment letter (Attachment D) jointly submitted by their companies. Ms. Brody said their comments were addressed in the version 3 and version 4 of the Section 8.C edits Ms. Hemphill presented. She voiced disappointment that a more principle-based solution could not be reached. Ms. Murphy noted John Hancock’s appreciation for the grandfathering options and the continuing conversation.

Leonard Mangini (American Academy of Actuaries—Academy) said the revised amendment proposal addressed the Academy comments (Attachment E). Brian Bayerle (American Council of Life Insurers—ACLI) said the ACLI comments (Attachment F) were also addressed.
Ms. Fenwick said the New York Department of Financial Services (NYDFS) is against allowing the use of future mortality improvement. She said the NYDFS prefers version 1 of the Section 8.C edits, which removes the option for grandfathering.

Ms. Hemphill said that a motion to expose the amendment proposal should include revisions to the guidance notes in Section 6.A.2.b.v and Section 9.C.7.f that add the phrase “prior to the adoption by LATF of the first set of future mortality improvement factors, the future mortality improvement rate shall be zero percent.”

Mr. Chupp made a motion, seconded by Mr. Leung, to re-expose amendment proposal 2020-10 (Attachment G), including the additional language provided by Ms. Hemphill, for a 12-day public comment period ending June 8. The motion passed, with Ms. Fenwick dissenting.

3. **Heard a Status Update on the ESG Project**

Mr. Boerner said a drafting group of Task Force members, NAIC staff, and Conning Inc. staff have been meeting regularly to facilitate the implementation of the economic scenario generator (ESG). He said future meetings will include industry subject matter experts (SMEs) from the ACLI and the Academy.

4. **Adopted Amendment Proposal 2021-06**

Angela McNabb (NAIC) said amendment proposal 2021-06 allows for a third party to submit experience data on behalf of the company participating in the mortality experience data call.

Mr. Chou made a motion, seconded by Mr. Sartain, to adopt amendment proposal 2021-06 (Attachment H). The motion passed unanimously.

Having no further business, the Life Actuarial (A) Task Force adjourned.
Life Actuarial (A) Task Force/ Health Actuarial (B) Task Force
Amendment Proposal Form*

1. Identify yourself, your affiliation and a very brief description (title) of the issue.

**Identification:**
PBR Staff of Texas Department of Insurance

**Title of the Issue:**
1. Address determination of materiality. VM-21 often refers to materiality but is missing a discussion on how materiality is determined.
2. Address use of approximations and simplifications in VM-21.

2. Identify the document, including the date if the document is “released for comment,” and the location in the document where the amendment is proposed:

VM-21 Section 1.E (new), VM-21 Section 3.H (new), VM-31 Section 3.E.1, VM-31 Section 3.F.2.e

January 1, 2021 NAIC Valuation Manual

3. Show what changes are needed by providing a red-line version of the original verbiage with deletions and identify the verbiage to be deleted, inserted or changed by providing a red-line (turn on “track changes” in Word®) version of the verbiage. (You may do this through an attachment.)

See attached.

4. State the reason for the proposed amendment? (You may do this through an attachment.)

1. VM-21 often refers to materiality but is missing a discussion on how materiality is determined (a materiality standard), as VM-20 has in VM-20 Section 2.H. Moreover, the current language of Materiality in the VA Summary in VM-31 Section 3.E.1 (2021 edition) is based on the Life PBR Summary in VM-31 (2019 edition). The language of Materiality in the VA Summary in Section 3.E.1 of VM-31 should be updated, consistent with adding a new section to VM-21 to address materiality.

For reference, here are the relevant VM-20 passages:

**VM-20 Section 2.H**
The company shall establish, for the DR and SR, a standard containing the criteria for determining whether an assumption, risk factor or other element of the principle-based valuation has a material impact on the size of the reserve. This standard shall be applied when identifying material risks. Such a standard shall also apply to the NPR with respect to VM-20 Section 2.G.
VM-31 Section 3.C.1

Life Summary – The PBR Actuarial Report shall contain a Life Summary of the critical elements of all sub-reports of the Life Report as detailed in Section 3.D. In particular, this Life Summary shall include:

1. VM-20 Materiality – The standard established by the company pursuant to VM-20 Section 2.H.

2. While it is common for companies to use a significant number of approximations, simplifications, and modeling efficiency techniques for their VM-21 valuation, VM-21 is missing an explicit allowance of approximations, simplifications, or modeling efficiency techniques. To understand the impact of the large number of approximations, simplifications, and modeling efficiency techniques, they should be covered in one location in the PBR reporting for VA, in contrast to the current reporting where they are scattered throughout the PBR Report. VM-20 Section 2.G does not allow simplifications to bias the reserve downward. This addresses the concern that a large number of immaterial simplifications could add up to a material understatement. VM-21 needs an assurance that simplifications do not compound one another to become material even more than VM-20, due to the very larger number of simplifications commonly used.

VM-21 Section 1.E (new)

Materiality

The company shall establish a standard containing the criteria for determining whether an assumption, risk factor or other element of the principle-based valuation has a material impact on the size of the reserve or TAR. This standard shall be applied when identifying material risks.

VM-21 Section 3.H (new)

H. A company may use simplifications, approximations and modeling efficiency techniques to calculate the stochastic reserve and/or the additional standard projection amount required by this section if the company can demonstrate that the use of such techniques does not understate TAR by a material amount, and the expected value of TAR calculated using simplifications, approximations and modeling efficiency techniques is not less than the expected value of TAR calculated that does not use them.

 Guidance Note:

Examples of modeling efficiency techniques include, but are not limited to:

1. Choosing a reduced set of scenarios from a larger set consistent with prescribed models and parameters.
2. Generating a smaller liability or asset model to represent the full seriatim model using grouping compression techniques or other similar simplifications.

There are multiple ways of providing the demonstration required by Section 3.H. The complexity of the demonstration depends upon the simplifications, approximations or modeling efficiency techniques used.

Examples include, but are not limited to:

1. Rounding at a transactional level in a direction that is clearly and consistently conservative or is clearly and consistently unbiased with an obviously immaterial impact on the result (e.g., rounding to the nearest dollar) would satisfy 3.H without needing a demonstration. However,
rounding to too few significant digits relative to the quantity being rounded, even in an unbiased way, may be material and in that event, the company may need to provide a demonstration that the rounding would not produce a material understatement of TAR.

2. A brute force demonstration involves calculating the minimum reserve both with and without the simplification, approximation or modeling efficiency technique, and making a direct comparison between the resulting TAR. Regardless of the specific simplification, approximation or modeling efficiency technique used, brute force demonstrations always satisfy the requirements of Section 3.H.

3. Choosing a reduced set of scenarios from a larger set consistent with prescribed models and parameters and providing a detailed demonstration of why it did not understate TAR by a material amount and the expected value of TAR would not be less than the expected value of TAR that would otherwise be calculated. This demonstration may be a theoretical, statistical or mathematical argument establishing, to the satisfaction of the insurance commissioner, general bounds on the potential deviation in the TAR estimate rather than a brute force demonstration.

4. Justify the use of randomly sampling withdrawal ages for each contract instead of following the exact prescribed WDCM method by demonstrating that the random sampling method is materially equivalent to the exact prescribed approach, and the simplification does not materially reduce the Additional Standard Projection Amount and the final reported TAR. In particular, the company should demonstrate that the statistical variability of the results based on the random sampling approach is immaterial by testing different random sets, e.g., if randomly selecting a withdrawal age for each contract, the probability distribution of the withdrawal age should be stable and not vary significantly when using different random number sets.

VM-31 Section 3.E.1

VA Summary – The PBR Actuarial Report shall contain a VA Summary of the critical elements of all sub-reports of the VA Report as detailed in Section 3.F. In particular, this VA Summary shall include:

1. Materiality – The Standard established by the company pursuant to VM-21 Section 1.E.

VM-31 Section 3.F.2.e

e. Approximations, Simplifications, and Modeling Efficiency Techniques – A description of each approximation, simplification or modeling efficiency technique used in reserve or TAR calculations, and a statement that the required VM-21 Section 3.H demonstration is available upon request and shows that: 1) the use of each approximation, simplification, or modeling efficiency technique does not understate TAR by a material amount; and 2) the expected value of TAR is not less than the expected value of TAR calculated without using the approximation, simplification, or modeling efficiency technique.

Deleted: A description of the rationale for determining whether a decision, information, assumption, risk or other element of a principle-based valuation under VM-21 has a material impact on the modeled reserve. Such rationale could include criteria such as a percentage of reserves, a percentage of surplus, and/or a specific monetary value, as appropriate.

Deleted: Approximations and Simplifications – Description of any approximations and simplifications used in each line projection calculation and their description in a different section of this report, including documentation that these did not materially reduce the modeled reserve.
Virginia is submitting comments regarding the following exposure:

**APF 2020-10 (Reflect Mortality Improvement)**

**Comment:**

Mortality improvement should be applied to the anticipated experience, rather than prudent estimate, mortality assumption. The VM is based on principles and guidelines. One of the most foundational principles is the relationship between anticipated experience and prudent estimate assumptions. Anticipated experience is to represent “an expectation of future experience”, while a prudent estimate assumption is “developed by applying a margin to the anticipated experience.” The margin “incorporates conservatism” and “is intended to provide for estimation error and adverse deviation”. APF 2020-10 is not consistent with this principle and violates many provisions of the VM. For example, Section 9.A.1 requires the use of prudent estimate assumptions for every risk factor not stochastically modeled by applying a margin to the anticipated experience. The prudent estimate mortality assumption in APF 2020-10 reflects mortality improvement past the valuation date while the anticipated mortality experience does not. This will result in negative margins in the mortality rates that are used past the valuation date and prudent estimate mortality rates that are lower than the rates based on anticipated experience. This will occur whenever the reduction produced by the mortality improvement factor exceeds the prescribed margin. Because of the violation of these principles, APF 2020-10, if adopted, could have unintended consequences and require further material edits to the VM in the future.

In the case where the anticipated experience mortality assumption is the industry basic table, since companies have the option, but are not required, to incorporate mortality improvement in the industry basic tables from the date of the table to the valuation date, the proposed APF 2020-10 could result in the company using an industry basic table which does not have mortality improvement reflected from the date of the table to the valuation date, but does have mortality improvement reflected beyond the valuation date. This does not make sense.

The proposed APF 2020-10 applies mortality improvement to the prudent estimate mortality assumption which contains a margin. This results in a higher reduction due to mortality improvement than if the improvement factors were applied to the anticipated experience, which does not contain a margin. This would serve to reduce and possibly eliminate the margin that is included in the mortality improvement factors.

The following alternative edits to the VM are consistent with these principles and maintain the appropriate relationship between anticipated experience and prudent estimate assumptions. The proposed edits to VM-20 Section 8.C and VM-31 in APF 2020-10 should be retained. The proposed edits to VM-20 Section 6 and VM-20 Section 9 should be replaced with the following alternative edits 1, 2 and 3.
Suggested Edits to VM:

EDIT #1, VM-20 Section 6.A.2.b.v:

v. Mortality improvement shall be incorporated as outlined in VM-20 Section 9.C.2.h for company experience and as outlined in VM-20 Section 9.C.3.g for the industry basic table, beyond the projection start date. No additional mortality improvement, other than what is allowed in Sections 9.C.2.h and 9.C.3.g, may not be reflected in the mortality assumption for the purpose of calculating the stochastic exclusion ratio.

EDIT #2, VM-20 Section 9.C.2.h:

h. Mortality improvement shall not be incorporated beyond the valuation date. However, historical mortality improvement from the central point of the underlying company experience to the valuation date may be incorporated. In addition, 20 years of mortality improvement beyond the valuation date shall be incorporated using future mortality improvement factors no greater than the loaded factors determined by the SOA, adopted by LATF, and published on the SOA website, at [link/reference to SOA site TBD].

Guidance Note: Mortality improvement may be positive or negative (i.e., deterioration).

To allow time for companies to reflect the updated future mortality improvement rates, the rates that are to be used in the year-end YYYY valuation should be adopted by LATF and published on the SOA website by September of YYYY. If this timeline is not met, then at the company’s option they may use the mortality improvement rates for the prior year (year YYYY-1).

Guidance Note: YYYY is the calendar year of valuation.

EDIT #3, VM-20 Section 9.C.3.g:

g. Mortality improvement shall not be incorporated beyond the valuation date. However, historical mortality improvement from the date of the industry basic table (e.g., Jan. 1, 2008, for the 2008 VBT and July 1, 2015, for the 2015 VBT) to the valuation date may be incorporated using the improvement factors for the applicable industry basic table as determined by the SOA, adopted by LATF, and published on the SOA website, https://www.soa.org/research/topics/indiv-val-exp-study-list/ (Mortality Improvement Rates for AG-38 for Year-End YYYY).

Guidance Note: The improvement factors for the industry basic table will be determined by the SOA. YYYY is the calendar year of valuation.

Guidance Note: The start date for the historical improvement factors to be applied to the industry basic tables differs from that used for determining company experience mortality rates as described in Section 9.C.2.h, as the industry basic tables have already been improved from the mid-point of the exposure period of the data underlying the table to the year of the table; e.g., the 2015 VBT has already been improved from the mid-point of the underlying data supporting the table to 2015.

In addition, 20 years of mortality improvement beyond the valuation date shall be incorporated using future mortality improvement factors no greater than the loaded factors determined by the SOA, adopted by LATF, and published on the SOA website, at [link/reference to SOA site TBD].
Guidance Note: Mortality improvement may be positive or negative (i.e., deterioration).

To allow time for companies to reflect the updated mortality improvement rates, the rates that are to be used in the year-end YYYY valuation should be adopted by LATF and published on the SOA website by September of YYYY. If this timeline is not met, then at the company’s option they may use the mortality improvement rates for the prior year (year YYYY-1).

Re: Comments on APF 2020-10

Dear Mr. Boerner:

I offer the following comments regarding APF 2020-10, which is under exposure through May 25, 2021. My comments pertain only to the changes to paragraph 18 of Section 8.C.18 of VM-20, which make the “interim approach” regarding the calculation of the YRT reinsurance reserve credit and the assumed YRT reinsurance reserve a longer-term solution.

1. Reserve credit provided to the ceding company:

A reserve credit of $\frac{1}{2}$ $cx$ (assuming an annual YRT reinsurance premium is paid in advance) may in some situations overstate the proper reserve credit. I recommend that in certain cases the YRT reinsurance cash flows (based on actuarial judgment following the requirements of VM-20) should be included in the determination of the deterministic and stochastic reserves, with the resulting reserve credit capped at $\frac{1}{2}$ $cx$ based on the applicable Commissioners Standard Mortality Table used for the NPR reserve:

The YRT reinsurance agreements that would be subject to a modeling requirement are those with one or more features described below, as of the valuation date (note that the reference to treaty termination includes in-force business, and the reference to termination on a reinsurance premium due date does not preclude a treaty requirement for prior written notification):

i. The ceding company does not have an option to terminate the agreement on each reinsurance premium due date with no payment required other than for outstanding balances that would be due (excluding any reinsurance premium due to be paid in advance) in the absence of treaty termination (in other words, there would be no penalty for recapture) AND current non-guaranteed reinsurance premium rates have a larger present value than the present value, using prudent estimate assumptions, of the corresponding projected death claims.

ii. The ceding company does not have an option to terminate the agreement on each reinsurance premium due date with no payment required other than for outstanding balances that would be due (excluding any reinsurance premium due to be paid in advance) in the absence of treaty termination AND the agreement contains an experience refund provision that is still in effect.

iii. The ceding company does not have an option to terminate the agreement on each reinsurance premium due date with no payment required other than for outstanding balances that would be due (excluding any reinsurance premium due to be paid in advance) in the absence of treaty termination AND the agreement covers universal life policies with material secondary guarantees.

iv. The ceding company does not have an option to terminate the agreement on the due date of a premium rate increase that is not fully supported by a change in anticipated mortality,
with no payment required other than for outstanding balances that would be due (excluding any reinsurance premium due to be paid in advance) in the absence of treaty termination.

2. Reserve set up by the assuming company:
A reserve of $\frac{1}{2} \, cx$ (assuming an annual YRT reinsurance premium is paid in advance) for mortality risk assumed under a YRT reinsurance agreement may in some situations understate the proper reserve. My recommendation is that in those cases the YRT reinsurance cash flows (based on actuarial judgment following the requirements of VM-20) should be included in the determination of the deterministic and stochastic reserves, with the resulting reserve floored at $\frac{1}{2} \, cx$ based on the applicable CSO mortality table used for the NPR reserve.

The YRT reinsurance agreements that would be subject to a modeling requirement are those with one or more features described below, as of the valuation date:

i. The reinsurance agreement contains a limitation or condition on the right of the reinsurer to increase the non-guaranteed premium rate scale up to the maximum specified in the reinsurance agreement. A provision in the reinsurance agreement that requires that reinsurance premium rate increases be supported by increases in anticipated mortality shall not be considered to be a condition or limitation for the purposes of this paragraph.

ii. The reinsurance agreement contains language that implicitly or explicitly states that it intends on continuing to charge the current rates. This does not include language that states that the reinsurer intends on continuing to charge the current rates unless there is an increase in anticipated experience.

iii. The reinsurance agreement is silent regarding its right to raise the YRT reinsurance premium rate scale.

iv. The maximum non-guaranteed reinsurance premiums allowed to be charged have a smaller present value, as of the valuation date, than the present value, using prudent estimate assumptions, of the corresponding projected death claims.

3. The ceding company’s reserve credit and the reinsurer’s reserve:
I also recommend that, notwithstanding items 1 and 2 above, VM-20 should specify that the regulator may require that YRT reinsurance cash flows be modeled if a YRT reinsurance agreement contains characteristics that, if modeled, may result in a reserve credit smaller than $\frac{1}{2} \, cx$ or a reserve greater than $\frac{1}{2} \, cx$. The reserve credit cap and the reserve floor specified above would still apply. This is intended to apply to YRT reinsurance agreements that have features that are not common or that appear to only be included for the purpose of preventing the treaty from being subject to the modeling requirement.

4. Guaranteed YRT reinsurance premium rates:
I also recommend, notwithstanding the above, that the ceding company’s reserve credit and the reinsurer’s reserve be modified to reflect reinsurance premium rates that are fully guaranteed.

Thank you for considering these comments.

Re: APF 2020-10

Dear Mr. Boerner,

We appreciate the opportunity to share our thoughts on Amendment Proposal Form (APF) 2020-10 which was exposed for public comment on April 8th, 2021.

Within the proposal, we are fully supportive of the new Section 9.C.7.f which allows prudent future mortality improvement to be reflected for up to 20 years beyond the valuation date. We believe that this is a step in the right direction by addressing one of the implicit margins inherent within VM-20. Publishing the rates on the Society of Actuaries website by September of the valuation year will also provide insurers with adequate time to implement the rates within their model governance frameworks. As the framework is finalized, we ask that regulators consider the margins already inherent in the base mortality assumptions and the multiplicative impact of additional margins on the mortality improvement.

We do not, however, believe that the inclusion of prudent future mortality improvement in gross reserve calculations adequately addresses the treatment of non-guaranteed YRT reinsurance within VM-20. We believe that applying a formulaic reserve credit equal to ½ Cx (equivalent to the NPR reinsurance credit from Section 8.B) moves VM-20 away from a principles-based framework and should continue to be considered as an interim methodology.

The ½ Cx reserve credit is an accounting consideration which only takes a one-year perspective of a multi-year YRT arrangement. It presumes that the reinsurer will reprice the risk annually. It does not consider the underlying reinsurance cashflows and is misaligned with the economics and risk-sharing of a non-guaranteed YRT arrangement.

Finally, under the current interim ½ Cx approach, optional grandfathering is permitted for policies issued on or after 1/1/2017 and before 1/1/2020. The inclusion of a grandfathering provision supports early adopters of VM-20 by not penalizing them for following the principle-based VM-20 rules in place at that time. A long-term solution that incorporates a formulaic approach, such as ½ Cx, rather than a principles-based solution, should apply on a prospective basis only where insurers can price and manage to the new rules, while maintaining optional grandfathering, subject to domestic regulatory approval, for policies issued on or after 1/1/2017 and before 1/1/2020. If optional grandfathering is not permitted, a transition period should be included that allows for a company to elect to phase new requirements. The phase in adopted as part of the NAIC’s Variable Annuity Framework (VM-21, Section 2.B) is a precedent that can inform a phase in to gradually and appropriately reflect the impacts of any long-term approach.
Thank you for consideration of these comments.

Re: APF 2020-10

Dear Mike,

The Life Reserves Work Group (LRWG) of the American Academy of Actuaries\(^1\) is pleased to have the opportunity to submit the following comments regarding exposed amendment proposal form (APF) 2020-10, which addresses inclusion of future mortality improvement (FMI) into principle-based reserving (PBR) valuation. The exposure specifically asks that comments address whether the “may” language proposed for 9.C.7.f and 9.C.3.g should be changed to “shall.”

The LRWG strongly agrees with the supporting rationale of this APF—namely that the reserve requirements in the current Valuation Manual exceed moderately adverse conditions in not allowing FMI to be incorporated into mortality assumptions.

We believe that the APF, as proposed, provides several protective “guardrails”:

- a prescribed margin that must be applied by the actuary to the promulgated FMI rates;
- a process whereby LATF would review and approve any periodic proposed FMI scale updates before they become effective and used in valuation;
- periodic studies which ensure that the FMI scale reflects recent trends, because PBR assumptions are required to be current, relevant, and credible; and
- a “bi-directional” structure in which the FMI scale could increase reserves if the underlying experience were to show slowing or negative improvement and lower reserves if the underlying experience were to show increasing or positive improvement.

The LRWG believes such a “bi-directional” impact works toward the overall goal of a principle-based valuation system producing “right-sized” reserves.

One might think that simply inserting “shall” language into sections 9.C.7.f and 9.C.3.g would be sufficient to accomplish the goal of including unfavorable FMI because this would require the actuary to incorporate FMI if it tended to raise reserves, while “may” language would not.

\(^1\) The American Academy of Actuaries is a 19,500-member professional association whose mission is to serve the public and the U.S. actuarial profession. For more than 50 years, the Academy has assisted public policymakers on all levels by providing leadership, objective expertise, and actuarial advice on risk and financial security issues. The Academy also sets qualification, practice, and professionalism standards for actuaries in the United States.
We believe the situation is more complex, because using only “shall” language would not permit the actuary to ignore FMI if including its impacts produced lower mortality than what would be considered a prudent estimate for the insurer’s situation.

We do suggest rewording sections 9.C.7.f and 9.C.3.g to use “shall” language if incorporating FMI increases reserves and use “may” language if incorporating FMI would reduce reserves. In doing so, if the FMI scale were clearly an improvement to mortality rates, the actuary would not need to perform extra work to effectively hold a higher reserve than required. We recognize that an actuary could raise the margin beyond the prescribed level to 100% of the applicable FMI scale so as to eliminate the beneficial impact of FMI. Further, we recognize that the actuary could point to Section 2.G and use a “modeling simplification” that ignores FMI, as doing so would increase reserves. Use of a Section 2.G modeling simplification, however, would require the actuary to provide additional demonstrations and documentation.

To summarize, we believe the inclusion of FMI in the Valuation Manual, as described in this APF is a positive move. We suggest rewording sections 9.C.7.f and 9.C.3.g to use “shall” if FMI increases reserves and use “may” if FMI decreases reserves.

Thank you for your consideration. Please contact Khloe Greenwood, the Academy’s life policy analyst, with any questions at greenwood@actuary.org.

Re: ACLI Comments on AFP 2020-10

Dear Mr. Boerner:

The American Council of Life Insurers (ACLI) appreciates the opportunity to provide comments on AFP 2020-10. The ACLI supports changes consistent with the spirit of a principles-based framework. Such a framework allows for prudent actuarial judgment in the setting of assumptions, and appropriate margin to capture uncertainty around those assumptions. ACLI has previously expressed concern around the level of margin currently within the VM-20 framework, and in particular the mortality margins.

We believe this amendment is an important step towards better alignment with a true principles-based framework. Recognition of future mortality improvement better aligns the framework with company and industry expectations and reduces disparities with market-driven provisions (such as current YRT premium rates).

We note that if ½ cx is adopted as the long-term approach for YRT, it would change applicable requirements for the 2017-2019 issues that were allowed to continue using the pre-interim approach language. In order to ease the transition for these blocks, we would suggest consideration of an optional transition to implement the change, similar to what was done for the revisions of the variable annuity framework.

We look forward to a discussion of this amendment on a future call. We appreciate the consideration of our comments.

Sincerely,

cc: Reggie Mazyck, NAIC

The American Council of Life Insurers (ACLI) is the leading trade association driving public policy and advocacy on behalf of the life insurance industry. 90 million American families rely on the life insurance industry for financial protection and retirement security. ACLI’s member companies are dedicated to protecting consumers’ financial wellbeing through life insurance, annuities, retirement plans, long-term care insurance, disability income insurance, reinsurance, and dental, vision and other supplemental benefits. ACLI’s 280 member companies represent 94 percent of industry assets in the United States.

Amendment Proposal Form 2020-10
Exposed for a 12-day public comment period ending June 7, 2021

Request for Comment: During the exposure, commenters are specifically asked to address the four versions exposed for the handling of YRT for the 2017-2019 issue years.

Please submit comments to Reggie Mazyck (RMazyck@naic.org) by COB 5/25/21.
Life Actuarial (A) Task Force/ Health Actuarial (B) Task Force
Amendment Proposal Form

1. Identify yourself, your affiliation and a very brief description (title) of the issue.

Reflect a prudent level of mortality improvement beyond the valuation date.

2. Identify the document, including the date if the document is “released for comment,” and the location in the document where the amendment is proposed:

3. Show what changes are needed by providing a red-line version of the original verbiage with deletions and identifying the verbiage to be deleted, inserted or changed by providing a red-line (turn on “track changes” in Word®) version of the verbiage. (You may do this through an attachment.)

See attached Appendix.

4. State the reason for the proposed amendment? (You may do this through an attachment.)

We propose to reflect a prudent level of mortality improvement beyond the valuation date, using SOA analysis for best estimate future mortality improvement and margin. The requirements also need to be clarified for the handling of historical or anticipated future mortality deterioration (i.e., negative improvement).

With the reflection of a prudent level of future mortality improvement in the mortality assumption, the interim 1/2cx approach to YRT is a reasonable consideration for a long-term approach.

For LATF consideration for re-exposure, there are four versions of the handling of the 2017-2019 issue year carveout from the interim YRT solution: 1) the original exposure, removing the carveout with the 1/2cx being made a longer term approach, 2) a modified version that removes the carveout, but makes that removal contingent on the first set of SOA future mortality rates being adopted, in case of delay, 3) a modified version that removes the carveout, but allows for a phase-in of the effect of this change, and 4) a version making the carveout long-term. These versions are presented starting on Page 6 of this document, after the other edits which do not vary based on this options.
Appendix

VM-20 Section 6.A.2.b.v:

v. Anticipated mortality improvement beyond the projection start date shall be reflected in the mortality assumption for the purpose of calculating the stochastic exclusion ratio. The future mortality improvement factors shall be no greater than the unloaded factors determined by the SOA, adopted by LATF, and published on the SOA website, at [link/reference to SOA site TBD].

Guidance Note: Mortality improvement may be positive or negative (i.e., deterioration). The anticipated mortality improvement may be lower than the rates published by the SOA, for example, if the company’s best estimate for mortality improvement for a particular block, such as simplified issue, is lower. Prior to adoption by LATF of the first set of future mortality improvement factors, the future mortality improvement rates shall be 0%.

To allow time for companies to reflect the updated mortality improvement rates, the rates that are to be used in the year-end YYYY valuation should be adopted by LATF and published on the SOA website by September of YYYY. If this timeline is not met, then at the company’s option they may use the mortality improvement rates for the prior year (year YYYY-1).

VM-20 Section 9.C.2.h:

h. Mortality improvement shall not be incorporated beyond the valuation date in the company experience mortality rates. However, historical mortality improvement from the central point of the underlying company experience data to the valuation date may be incorporated.

Guidance Note: Future mortality improvement is not applied to the company experience mortality rates, since it would be duplicative of the future mortality improvement that is applied to the prudent estimate assumptions for mortality in Section 9.C.7.f.

VM-20 Section 9.C.3.g:

g. Mortality improvement shall not be incorporated beyond the valuation date in the industry basic table. However, historical mortality improvement from the date of the industry basic table (e.g., Jan. 1, 2008, for the 2008 VBT and July 1, 2015, for the 2015 VBT) to the valuation date shall be incorporated using the improvement factors for the applicable industry basic table as determined by the SOA, adopted by LATF, and published on the SOA website, https://www.soa.org/research/topics/indiv-val-exp-study-list/ (Mortality Improvement Rates for AG-38 for Year-End YYYY).

Guidance Note: Future mortality improvement is not applied to the industry basic table, since it would be duplicative of the future mortality improvement that is applied to the prudent estimate assumptions for mortality in Section 9.C.7.f.
To allow time for companies to reflect the updated mortality improvement rates, the rates that are to be used in the year-end YYYY valuation should be adopted by LATF and published on the SOA website by September of YYYY. If this timeline is not met, then at the company’s option they may use the most recent set of prior mortality improvement rates adopted by LATF and published on the SOA website.

VM-20 Section 9.C.7.a:
If applicable industry basic tables are used in lieu of company experience as the anticipated experience assumptions, or if the level of credibility of the data as provided in Section 9.C.5 is less than 20%, the prudent estimate assumptions for each mortality segment shall equal the respective mortality rates in the applicable industry basic tables as provided in Section 9.C.3, adjusted as necessary pursuant to Section 9.C.7.e and for any applicable improvement pursuant to Section 9.C.3.g, plus the prescribed margin as provided in Section 9.C.6.c, plus any applicable additional margin pursuant to Section 9.C.6.d.v and/or Section 9.C.6.d.vi. Future mortality improvement, pursuant to Section 9.C.7.f, shall be applied to the prudent estimate assumption for mortality.

Section 9.C.7.b.vi
Beginning in the first policy duration after policy duration E, the prudent estimate mortality assumptions for each policy in a given mortality segment are determined as a weighted average of the company experience mortality rates with margins and the applicable industry basic table with margins, in which the weights on the company rates grade linearly from 100% down to 0%. This grading must be completed—i.e., must reach 100% of industry table—no later than the beginning of the first policy duration after policy duration Z (the determination of the applicable industry basic table is described in Section 9.C.3). Thus, the prudent estimate mortality rate, prior to any adjustments pursuant to Sections 9.C.7.c, 9.C.7.d, 9.C.7.e and 9.C.7.f below, is:

VM-20 Section 9.C.7.f (new section):
Twenty years of future mortality improvement that the company anticipates beyond the valuation date shall be applied to the prudent estimate assumptions for mortality, using prudent future mortality improvement factors no greater than the loaded factors determined by the SOA, adopted by LATF, and published on the SOA website. (Link/reference to SOA site TBD).

**Guidance Note:** Mortality improvement may be positive or negative (i.e., deterioration). The anticipated mortality improvement may be lower than the rates published by the SOA, even zero, for example, if the company’s best estimate for mortality improvement for a particular block, such as simplified issue, is lower.

Prior to adoption by LATF of the first set of future mortality improvement factors, the future mortality improvement rates shall be 0%.

To allow time for companies to reflect the updated mortality improvement rates, the rates that are to be used in the year-end YYYY valuation should be adopted by LATF and published on the SOA website by September of YYYY. If this timeline is not met, then at the company’s option they may use the mortality improvement rates for the prior year (year YYYY-1).
VM-31 Section 3.D.3.i:

i. **Mortality Improvement** – Description of and rationale for the mortality improvement assumptions applied up to the valuation date and the mortality improvement assumptions applied beyond the valuation date. Such a description shall include the assumed start and end dates of the improvements and a table of the annual improvement percentage(s) used, both without and with margin, separately for company experience and the industry basic table(s), along with a sample calculation of the adjustment (e.g., for a male preferred nonsmoker age 45).

VM-31 Section 3.D.11.c.i:

i. If the company believes the method used to determine anticipated experience mortality assumptions includes an implicit margin, the company can adjust the anticipated experience assumptions to remove this implicit margin for this reporting purpose only. If any such adjustment is made, the company shall document the rationale and method used to determine the anticipated experience assumption.

Deleted: Adjustments for
Deleted: any adjustments to
Deleted: mortality assumptions for

Deleted: For example, to the extent the company expects mortality improvement after the valuation date, any such mortality improvement is an implicit margin and, therefore, is an acceptable adjustment to the anticipated experience assumptions.
2017-2019 for Long-Term YRT – Version 1:

VM-20 Section 8.C, introductory paragraph:

C. Reflection of Reinsurance Cash Flows in the Deterministic Reserve or Stochastic Reserve

For non-guaranteed YRT reinsurance ceded or assumed, the cash-flow modeling requirements in Sections 8.C.1 through 8.C.14 below do not apply since non-guaranteed YRT reinsurance ceded or assumed does not need to be modeled; see Section 8.C.18 below. YRT shall include other reinsurance arrangements that are similar in effect to YRT.

VM-20 Section 8.C.18 and Guidance Note:

18. When the reinsurance ceded or assumed is on a non-guaranteed YRT or similar basis, the corresponding reinsurance cash flows do not need to be modeled. Rather, for a ceding company, the post-reinsurance-ceded DR or SR shall be the pre-reinsurance-ceded DR or SR pursuant to Section 8.D.2, plus any applicable provision pursuant to Section 8.C.15 and Section 8.C.17, minus the NPR reinsurance credit from Section 8.B. For an assuming company, the DR or SR for the business assumed on a non-guaranteed YRT or similar basis shall be set equal to the NPR from Section 3.B.8, plus any applicable provision pursuant to Section 8.C.16 and Section 8.C.17. In the case where there are also other reinsurance arrangements that are not on a non-guaranteed YRT or similar basis, the reinsurance credit shall include the modeled reinsurance credit reflecting those other reinsurance arrangements. In particular, where there are also other reinsurance arrangements that are dependent on the non-guaranteed YRT or similar actuarial judgment shall be used to project cash flows consistent with the above outlined treatment for non-guaranteed YRT or similar arrangements.

Deleted: For policies issued on or after Jan. 1, 2020, and optionally for policies issued on or after Jan. 1, 2017, and before Jan. 1, 2020:

Deleted: For policies issued on or after Jan. 1, 2020, and optionally for policies issued on or after Jan. 1, 2017, and before Jan. 1, 2020:

Deleted: Guidance Note: The above method is an interim approach. A longer-term solution to YRT is intended to be adopted by state insurance regulators, after state insurance regulators and industry have had additional time to consider and evaluate the variety of approaches that have been put forward as a potential longer-term solution.
2017-2019 for Long-Term YRT – Version 2:

VM-20 Section 8.C, introductory paragraph:

C. Reflection of Reinsurance Cash Flows in the Deterministic Reserve or Stochastic Reserve

For policies issued on or after Jan. 1, 2020, and optionally for policies issued on or after Jan. 1, 2017, and before Jan. 1, 2020 up until adoption by LATF of the first set of unloaded future mortality improvement factors, at which point this shall apply for all policies issued on or after Jan. 1, 2017:

For non-guaranteed YRT reinsurance ceded or assumed, the cash-flow modeling requirements in Sections 8.C.1 through 8.C.14 below do not apply since non-guaranteed YRT reinsurance ceded or assumed does not need to be modeled; see Section 8.C.18 below. YRT shall include other reinsurance arrangements that are similar in effect to YRT.

VM-20 Section 8.C.18 and Guidance Note:

18. For policies issued on or after Jan. 1, 2020, and optionally for policies issued on or after Jan. 1, 2017, and before Jan. 1, 2020 up until adoption by LATF of the first set of unloaded future mortality improvement factors, at which point this shall apply for all policies issued on or after Jan. 1, 2017:

When the reinsurance ceded or assumed is on a non-guaranteed YRT or similar basis, the corresponding reinsurance cash flows do not need to be modeled. Rather, for a ceding company, the post-reinsurance-ceded DR or SR shall be the pre-reinsurance-ceded DR or SR pursuant to Section 8.D.2, plus any applicable provision pursuant to Section 8.C.15 and Section 8.C.17, minus the NPR reinsurance credit from Section 8.B. For an assuming company, the DR or SR for the business assumed on a non-guaranteed YRT or similar basis shall be set equal to the NPR from Section 3.B.8, plus any applicable provision pursuant to Section 8.C.16 and Section 8.C.17. In the case where there are also other reinsurance arrangements that are not on a non-guaranteed YRT or similar basis, the reinsurance credit shall include the modeled reinsurance credit reflecting those other reinsurance arrangements. In particular, where there are also other reinsurance arrangements that are dependent on the non-guaranteed YRT or similar actuarial judgment shall be used to project cash flows consistent with the above outlined treatment for non-guaranteed YRT or similar arrangements.

**Deleted:**

**Guidance Note:** The above method is an interim approach. A longer-term solution to YRT is intended to be adopted by state insurance regulators, after state insurance regulators and industry have had additional time to consider and evaluate the variety of approaches that have been put forward as a potential longer-term solution.
2017-2019 for Long-Term YRT – Version 3:

C. Reflection of Reinsurance Cash Flows in the Deterministic Reserve or Stochastic Reserve

For non-guaranteed YRT reinsurance ceded or assumed, the cash-flow modeling requirements in Sections 8.C.1 through 8.C.14 below do not apply since non-guaranteed YRT reinsurance ceded or assumed does not need to be modeled; see Section 8.C.18 below. YRT shall include other reinsurance arrangements that are similar in effect to YRT.

For policies issued on or after Jan. 1, 2017, and before Jan. 1, 2020, the company may elect, with domiciliary commissioner approval, a phase-in of the current methodology for non-guaranteed YRT reinsurance with allowance for future mortality improvement from the methodology in the 2021 Valuation Manual for non-guaranteed YRT reinsurance without allowance for future mortality improvement, provided that the company uses a weighted average of the results from the two methodologies, with the weight for the prior methodology being no more than \((20XX-YYYY)/(20XX-2021)\), where YYYY is the current valuation year and 20XX is the final year of the phase-in. A company may elect to phase in these requirements over a 3-year period beginning Jan. 1, 2022 and ending Dec. 31, 2024. A company may elect a longer phase-in period of up to seven years beginning Jan. 1, 2022 and ending Dec. 31, 2028, with approval of the domiciliary commissioner.

VM-20 Section 8.C.18 and Guidance Note:

18. When the reinsurance ceded or assumed is on a non-guaranteed YRT or similar basis, the corresponding reinsurance cash flows do not need to be modeled. Rather, for a ceding company, the post-reinsurance-ceded DR or SR shall be the pre-reinsurance-ceded DR or SR pursuant to Section 8.D.2, plus any applicable provision pursuant to Section 8.C.15 and Section 8.C.17, minus the NPR reinsurance credit from Section 8.B. For an assuming company, the DR or SR for the business assumed on a non-guaranteed YRT or similar basis shall be set equal to the NPR from Section 3.B.8, plus any applicable provision pursuant to Section 8.C.16 and Section 8.C.17. In the case where there are also other reinsurance arrangements that are not on a non-guaranteed YRT or similar basis, the reinsurance credit shall include the modeled reinsurance credit reflecting those other reinsurance arrangements. In particular, where there are also other reinsurance arrangements that are dependent on the non-guaranteed YRT or similar actuarial judgment shall be used to project cash flows consistent with the above outlined treatment for non-guaranteed YRT or similar arrangements.

For policies issued on or after Jan. 1, 2017, and before Jan. 1, 2020, the company may elect, with domiciliary commissioner approval, a phase-in of the current methodology for non-guaranteed YRT reinsurance with allowance for future mortality improvement from the methodology in the 2021 Valuation Manual for non-guaranteed YRT reinsurance without allowance for future mortality improvement, provided that the company uses a weighted average of the results from the two methodologies, with the weight for the prior methodology being no more than \((20XX-YYYY)/(20XX-2021)\), where YYYY is the
current valuation year and 20XX is the final year of the phase-in. A company may elect to phase in these requirements over a 3-year period beginning Jan. 1, 2022 and ending Dec. 31, 2024. A company may elect a longer phase-in period of up to seven years beginning Jan. 1, 2022 and ending Dec. 31, 2028, with approval of the domiciliary commissioner.

VM-31 Section 3.D.8.g (new):

g. Phase-In: If electing a phase-in period as described in VM-20 Section 8.C, documentation of the length of the phase-in approved by the company’s domiciliary commissioner, the result of the current and prior methodologies, the weights applied to each result, and confirmation that reinsurance assumptions for the calculation of the prior methodology are discussed in Section 3.D.8.b above.
2017-2019 for Long-Term YRT – Version 4:

C. Reflection of Reinsurance Cash Flows in the Deterministic Reserve or Stochastic Reserve

For policies issued on or after Jan. 1, 2020, and optionally for policies issued on or after Jan. 1, 2017, and before Jan. 1, 2020:

For non-guaranteed YRT reinsurance ceded or assumed, the cash-flow modeling requirements in Sections 8.C.1 through 8.C.14 below do not apply since non-guaranteed YRT reinsurance ceded or assumed does not need to be modeled; see Section 8.C.18 below. YRT shall include other reinsurance arrangements that are similar in effect to YRT.

VM-20 Section 8.C.18 and Guidance Note:

18. For policies issued on or after Jan. 1, 2020, and optionally for policies issued on or after Jan. 1, 2017, and before Jan. 1, 2020:

When the reinsurance ceded or assumed is on a non-guaranteed YRT or similar basis, the corresponding reinsurance cash flows do not need to be modeled. Rather, for a ceding company, the post-reinsurance-ceded DR or SR shall be the pre-reinsurance-ceded DR or SR pursuant to Section 8.D.2, plus any applicable provision pursuant to Section 8.C.15 and Section 8.C.17, minus the NPR reinsurance credit from Section 8.B. For an assuming company, the DR or SR for the business assumed on a non-guaranteed YRT or similar basis shall be set equal to the NPR from Section 3.B.8, plus any applicable provision pursuant to Section 8.C.16 and Section 8.C.17. In the case where there are also other reinsurance arrangements that are not on a non-guaranteed YRT or similar basis, the reinsurance credit shall include the modeled reinsurance credit reflecting those other reinsurance arrangements. In particular, where there are also other reinsurance arrangements that are dependent on the non-guaranteed YRT or similar actuarial judgment shall be used to project cash flows consistent with the above outlined treatment for non-guaranteed YRT or similar arrangements.

Guidance Note: The above method is an interim approach. A longer-term solution to YRT is intended to be adopted by state insurance regulators, after state insurance regulators and industry have had additional time to consider and evaluate the variety of approaches that have been put forward as a potential longer-term solution.
Life Actuarial (A) Task Force/ Health Actuarial (B) Task Force

Amendment Proposal Form*

1. Identify yourself, your affiliation and a very brief description (title) of the issue.

   Angela McNabb & Pat Allison – NAIC staff support

   Revisions to VM-50 and VM-51 to allow for data experience reporting to be performed by a reinsurer or third-party administrator and a correction to VM-51 Appendix 4.

2. Identify the document, including the date if the document is “released for comment,” and the location in the document where the amendment is proposed:

3. Show what changes are needed by providing a red-line version of the original verbiage with deletions and identify the verbiage to be deleted, inserted or changed by providing a red-line (turn on “track changes” in Word®) version of the verbiage. (You may do this through an attachment.)

   See attached redline document.

4. State the reason for the proposed amendment? (You may do this through an attachment.)

   This APF is needed for the following reasons:

   1. VM-51 Appendix 4 includes a column indicating the position within the data file for each field. This is not valid as the NAIC’s RDC system was designed to accept comma delimited files. This APF will remove that column.

   2. The VM-51 Section 2.B states that companies must submit data for all their direct written business prior to reinsurance ceded. The only exception is in the case of assumption reinsurance where policies have been legally novated. The NAIC has received feedback from a number of companies indicating that they have business that is reinsured and fully administered by the reinsurer. Since the ceding companies do not have the data, it represents a hardship for them to submit this business.

   3. Currently, VM-51 Appendix 4 only allows one company code. In order to allow a reinsurer or third-party administrator to submit data on behalf of the direct writer, the NAIC must be able to identify both the submitting company and the direct writer of the block of business. This APF adds an additional field to accomplish this. By having the submitting company’s code, any questions the NAIC has regarding the data can be directed to the submitting company without fear of breaching confidentiality.

   4. Having separate identifiers for the submitting company and direct writer will allow the NAIC to validate the reconciliations required by VM-50 Section 4.B.3.

   Below are examples showing how the reconciliations would work according to the amended language in VM-50 Section 4.B.3.

   Example 1: This example illustrates the scenario described in redlined language in VM-50 Section 4.B.3.c. Company A is a direct writer selected for VM-51 reporting.

   o The company has retained and administers 35,000 policies (out of a total of 100,000).
   o Company B (a reinsurer not selected to submit their own business) administers 50,000 policies for Company A.
Experience Reporting Requirements VM-50

- Company C (a reinsurer selected to submit their own direct business) administers 15,000 policies for Company A.

<table>
<thead>
<tr>
<th>RECONCILIATION FOR COMPANY A (Direct Writer)</th>
<th>Policy Count</th>
<th>Insurance Amount</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total Business as Reported in Company A's Annual Statement</td>
<td>100,000</td>
<td>2,500,000,000</td>
</tr>
<tr>
<td>Business being reported by Company B</td>
<td>(50,000)</td>
<td>(1,250,000,000)</td>
</tr>
<tr>
<td>Business being reported by Company C</td>
<td>(15,000)</td>
<td>(50,000,000)</td>
</tr>
<tr>
<td>Totals included in Company A’s data submissions</td>
<td>35,000</td>
<td>1,200,000,000</td>
</tr>
</tbody>
</table>

Example 2: This example illustrates the scenario described in the redlined language in VM-50 Section 4.B.3.a. Company D is another direct writing company selected for VM-51 reporting. Company B has been asked by Companies A and D to submit data Company B has assumed and administers.

- Company B administers 50,000 policies for Company A.
- Company B administers 100,000 policies for Company D.
- Company B is not required to reconcile to their Annual Statement since they were not selected to submit their direct business.
- In this example, Company B is a reinsurer. However, Company B could also be a third-party administrator that is not an insurance company.

<table>
<thead>
<tr>
<th>RECONCILIATION FOR COMPANY B</th>
<th>Policy Count</th>
<th>Insurance Amount</th>
</tr>

<td>100,000</td>
<td>1,500,000,000</td>
</tr>
<tr>
<td>Totals included in Company B’s data submission</td>
<td>150,000</td>
<td>2,750,000,000</td>
</tr>
</tbody>
</table>

Example 3: This example illustrates the scenario described in redlined language in VM-50 Section 4.B.3.b. Company C has also been asked by company A to submit data Company C has assumed and administers.

- Company C has 1,500,000 policies reported in their Annual Statement.
- Company C has 250,000 of reinsurance assumed policies which should not be included in their submission. Reinsurance assumed should only be included when the ceding company requests that the reinsurer report it on their behalf.
- Company C has 1,250,000 policies of direct written business that they must report.
- In addition to Company C’s direct written business, they will also be reporting 15,000 policies that they administer on behalf of Company A (per Company A’s request).

**Notes:** APF 2021-06
Section 1: Overview

A. Purpose of the Experience Reporting Requirements

The purpose of this section is to define the requirements pursuant to Section 13 of Model #820 for the submission and analysis of company data. It includes consideration of the experience reporting process, the roles of the relevant parties, and the intended use of and access to the data, and the process to protect the confidentiality of the data as outlined in Model #820.

B. PBR and the Need for Experience Data

The need for experience data includes but is not limited to:

1. PBR may require development of assumptions and margins based on company experience, industry experience or a blend of the two. The collection of experience data provides a database to establish industry experience tables or factors, such as valuation tables or factors as needed.

2. The development of industry experience tables provides a basis for assumptions when company data is not available or appropriate and provides a comparison basis that allows the state insurance regulator to perform reasonableness checks on the appropriateness of assumptions as documented in the actuarial reports.

3. The collection of experience data may assist state insurance regulators, reviewing actuaries, auditors and other parties with authorized access to the PBR actuarial reports to perform reasonableness checks on the appropriateness of principle-based methods and assumptions, including margins, documented in those reports.

4. The collection of experience data provides an independent check on the accuracy and completeness of company experience studies, thereby encouraging companies to establish a disciplined internal process for producing experience studies. Industry aggregate or sub-industry aggregate experience studies may assist an individual company for use in setting experience-based assumptions. As long as the confidentiality of each company's submitted results is maintained, a company may obtain results of a study on companies' submitted experience for use in formulating experience assumptions.

5. The collection of experience data will provide a basis for establishing and updating the assumptions and margins prescribed by regulators in the Valuation Manual.

6. The reliability of assumptions based on company experience is founded on reliable historical data from comparable characteristics of insurance policies including, but not limited to, underwriting standards and insurance policy benefits and provisions. As with
all forms of experience data analysis, larger and more consistent statistical samples have a greater probability of producing reliable analyses of historic experience than smaller or inconsistent samples. To improve statistical credibility, it is necessary that experience data from multiple companies be combined and aggregated.

7. The collection of experience data allows state insurance regulators to identify outliers and monitor changes in company experience factors versus a common benchmark to provide a basis for exploring issues related to those differences.

8. PBR is an emerging practice and will evolve over time. Research studies other than those contemplated at inception may be useful to improvement of the PBR process, including increasing the accuracy or efficiency of models. Because the collection of experience data will facilitate these improvements, research studies of various types should be encouraged.

9. The collection of experience data is not intended as a substitute for a robust review of companies’ methodologies or assumptions, including dialogue with companies’ actuaries.

Section 2: Statutory Authority and Experience Reporting Agent

A. Statutory Authority

1. Model #820 provides the legal authority for the Valuation Manual to prescribe experience reporting requirements with respect to companies and lines of business within the scope of the model.

2. The statutes and regulations requiring data submissions generally apply to all companies licensed to sell life insurance, A&H insurance and deposit-type contracts. These companies must submit experience data as prescribed by the Valuation Manual.

3. Section 4A(5) of Model #820 defines the data to be collected to be confidential.

B. Experience Reporting Agent

1. For the purposes of implementing the experience reporting required by state laws based on Section 13 of Model #820, an Experience Reporting Agent will be used for the purpose of collecting, pooling and aggregating data submitted by companies as prescribed by lines of business included in VM-51.

2. The NAIC is designated as Experience Reporting Agent for the Statistical Plan for Mortality beginning Jan. 1, 2020, and NAIC expertise in collecting and sorting data from multiple sources into a cohesive database in a secure and efficient manner, but the designation of the NAIC as Experience Reporting Agent does not preclude state insurance regulators from independently engaging other entities for similar data required under this Valuation Manual or other data purposes.

Section 3: Experience Reporting Requirements

A. Statistical Plans

1. Consistent with state laws based on Section 13 of Model #820, the Experience Reporting Agent shall collect experience data based on statistical plans defined in the Valuation Manual.

2. Statistical plans are detailed instructions that define the type of experience data being collected (e.g., mortality; elective policyholder behavior, such as surrenders, lapses,
Experience Reporting Requirements

premium payment patterns, etc.; and company expense data, such as commissions, policy expenses, overhead expenses etc.). The state insurance regulators serving on the Life Actuarial (A) Task Force and Health Actuarial (B) Task Force, or any successor body, will be responsible for prescribing the requirements for any statistical plan by applicable line of business. For each type of experience data being collected, the statistical plan will define the data elements and format of each data element, as well as the frequency of the collection of experience data. The statistical plan will define the process and the due dates for submitting the experience data. The statistical plan will define criteria that will determine which companies must submit the experience data. The statistical plan will also define the scope of business that is to be included in the experience data collection, such as lines of business, product types, types of underwriting, etc. Statistical plans are defined in VM-51 of the Valuation Manual. Statistical plans will be added to VM-51 of the Valuation Manual when they are ready to be implemented. Additional data elements and formats to be collected will be added as necessary, in subsequent revisions to the Valuation Manual.

3. Data must conform to common data definitions. Standard definitions provide for stable and reliable databases and are the basis of meaningful aggregated insurance data. This will be accomplished through a uniform set of suggested minimum experience reporting requirements for all companies.

B. Role and Responsibilities of the Experience Reporting Agent

1. Based on requirements of VM-51, the Experience Reporting Agent may design its data collection procedures to ensure it is able to meet these regulatory requirements. The Experience Reporting Agent will provide sufficient notice to reporting companies of changes, procedures and error tolerances to enable the companies to adequately prepare for the data submission.

2. The Experience Reporting Agent will aggregate the experience of companies using a common set of classifications and definitions to develop industry experience tables.

3. The Experience Reporting Agent will seek to enter into agreements with a group of state insurance departments for the collection of information under statistical plans included in VM-51. The number of states that contract with the Experience Reporting Agent will be based on achieving a target level of industry experience prescribed by VM-51 for each line of business in preparing an industry experience table.

a. The agreement between the state insurance department(s) and the Experience Reporting Agent will be consistent with any data collection and confidentiality requirements included within Model #820 and the Valuation Manual. Those state insurance departments seeking to contract with the Experience Reporting Agent will inform the Experience Reporting Agent of any other state law requirements, including laws related to the procurement of services that will need to be considered as part of the contracting process.

b. Use of the Experience Reporting Agent by the contracting state insurance departments does not preclude those state insurance departments or any other state insurance departments from contracting independently with another Experience Reporting Agent for similar data required under this Valuation Manual or other data purposes.

4. The Life Actuarial (A) Task Force or Health Actuarial (B) Task Force will be responsible for the content and maintenance of the experience reporting requirements. The Life
Experience Reporting Requirements VM-50

Actuarial (A) Task Force or Health Actuarial (B) Task Force or a working group will monitor the data definitions, quality standards, appendices and reports described in the experience reporting requirements to assure that they take advantage of changes in technology and provide for new regulatory and company needs.

5. To ensure that the experience reporting requirements will continue to be useful, the Life Actuarial (A) Task Force or Health Actuarial (B) Task Force will seek to review each statistical plan on a periodic basis at least once every five years. The Life Actuarial (A) Task Force or Health Actuarial (B) Task Force should have regular dialogue, feedback and discussion of this topic. In seeking feedback and engaging in discussions, the Life Actuarial (A) Task Force or Health Actuarial (B) Task Force shall include a broad range of data users, including state insurance regulators, consumer representatives, members of professional actuarial organizations, large and small companies, and insurance trade organizations.

6. The Experience Reporting Agent will obtain and undergo at least annual external audits to validate that controls with respect to data security and related topics are consistent with industry standards and best practices. The Experience Reporting Agent will provide a copy of any report prepared in connection with such an audit, upon a company’s request. In the event of a material deficiency identified in the external audit or in the event of an identified security breach affecting the Experience Reporting Data, the Experience Reporting Agent shall notify the NAIC, and the states that have directed the Experience Reporting Agent to collect this information, of the nature and extent of such an issue. In the event of an identified security breach affecting Experience Reporting Data, the Experience Reporting Agent shall also notify any insurer whose data was affected. Upon good cause shown, the Experience Reporting Agent will take reasonable actions to protect the data under its control, including that the data submission process may be suspended until the security issue has been remediated. If data submission is suspended under this section, the Experience Reporting Agent will work with the states that have directed collection to issue appropriate guidance modifying the requirements of VM 51, Section 2.D. The term “good cause” shall mean that there is the chance of irreparable harm upon continuing the transmission of the data to the Experience Reporting Agent. Once the security issue has been remediated, the Experience Reporting Agent shall notify the NAIC and the states that have directed the Experience Reporting Agent to collect this information. The Experience Reporting Agent shall work in conjunction with the NAIC and the states that have directed the Experience Reporting Agent to collect this information to develop a revised data submission schedule for any deferred submissions. The revised schedule shall provide for reasonable timing for companies to provide such data.

C. Role of Other Organizations

The Experience Reporting Agent may ask for other organizations to play a role for one or more of the following items, including the execution of agreements and incorporation of confidentiality requirements where appropriate:

1. Consult with the NAIC (as appropriate) in the design and implementation of the experience retrieval process;
2. Assist with the data validation process for data intended to be forwarded to the SOA or other actuarial professional organizations to develop industry experience tables;
3. Analyze data, including any summarized or aggregated data, produced by the Experience Reporting Agent;
Experience Reporting Requirements

4. Create initial experience tables and any revised tables;

5. Provide feedback in the development and evaluation of requests for proposal for services related to the reporting of experience requirement;

6. Create statutory valuation tables as appropriate and necessary;

7. Determine and produce additional industry experience tables or reports that might be suggested by the data collected;

8. Work with the Life Actuarial (A) Task Force or Health Actuarial (B) Task Force, in accordance with the Valuation Manual governance process, in developing new reporting formats and modifying current experience reporting formats;

9. Support a close working relationship among all parties having an interest in the success of the experience reporting requirement.

Section 4: Data Quality and Ownership

A. General Requirements

1. The quality, accuracy and consistency of submitted data is key to developing industry experience tables that are statistically credible and represent the underlying emerging experience. Statistical procedures cannot easily detect certain types of errors in reporting of data. For example, if an underwriter fails to evaluate the proper risk classification for an insured, then the “statistical system” has little chance of detecting such an error unless the risk classification is somehow implausible.

2. To ensure data quality, coding a policy, loss, transaction or other body of data as anything other than what it is known as is prohibited. This does not preclude a company from coding a transaction with incomplete detail and reporting such transactions to the Experience Reporting Agent, but there can be nothing that is known to be inaccurate or deceptive in the reporting. An audit of a company’s data submitted to the Experience Reporting Agent under a statistical plan in VM-51 can include comparison of submitted data to other company files.

3. When the Experience Reporting Agent determines that the cause of an edit exception could produce systematic errors, the company must correct the error and respond in a timely fashion, with priority given to errors that have the largest likelihood to affect a significant amount of data. When an error is found that has affected data reported to the Experience Reporting Agent, the company shall report the nature of the error and the nature of its likely impact to the Experience Reporting Agent. Retrospective correction of data subject to systematic errors shall be done when the error affects a significant amount of data that is still being used for regulatory purposes and it is reasonably practical to make the correction through the application of a computer program or a procedure applied to the entire data set without the need to manually examine more than a small number of individual records.

B. Specific Requirements

1. Once the data file is submitted by the company, the Experience Reporting Agent will perform a validity check of the data elements within each data record in the data file for proper syntax and verify that required data elements are populated. The Experience Reporting Agent will notify the company of all syntax errors and any missing data elements
that are required. Companies are required to respond to the Experience Reporting Agent by submitting a corrected data file. The Experience Reporting Agent will provide sufficient notice to reporting companies of changes, procedures and error tolerances to enable the companies to adequately prepare for the data submission.

2. Each submission of data filed by an insurance company with the Experience Reporting Agent shall be balanced against a set of control totals provided by the company with the data submission. At a minimum, these control totals shall include applicable record counts, claim counts, amounts insured and claim amounts. Any submission that does not balance to the control totals shall be referred to the company for review and resolution.

3. Each company submitting experience data and each company on whose behalf data is being submitted as required in VM-51 will perform a reconciliation between its submitted experience data with its statistical and financial data, and provide an explanation of differences, to the Experience Reporting Agent. The reconciliation must include policy count and insurance amount.
   a. If a third-party administrator that is not an insurance company or an insurance company not required to submit their direct data is submitting data on behalf of an insurance company, the reconciliation will consist of separate lines identifying each insurance company for whom this entity is submitting data.
   b. If the third-party administrator is an insurance company that is required to submit their direct data, the reconciliation must include separate lines identifying each additional company whose data is being submitted.
   c. The reconciliation to company statistical and financial data for both the direct writer and the reinsurer or third-party administrator must include lines indicating the amount of business that is being reported by the reinsurer or third-party administrator. The NAIC will use this information to confirm that all in-scope business is reported and there is no double counting of policies.

4. Validity checks are designed to identify:
   a. Improper syntax or incomplete coding (e.g., a numeric field that is not numeric, missing elements of a date field);
   b. Data elements containing codes that are not contained within the set of possible valid codes;
   c. Data elements containing codes that are contained within the set of possible valid codes but are not valid in conjunction with another data element code;
   d. Required data elements that are not populated.

5. Where quality would not appear to be significantly compromised, the Experience Reporting Agent may use records with missing or invalid data if such invalid or missing data do not involve a field that is relevant or would affect the credibility of the report. For companies with a body of data for a state, line of business, product type or observation period that fails to meet these standards, the Experience Reporting Agent will use its discretion, with regulatory disclosure of key decisions made, regarding the omission of the entire body of data or only including records with valid data. Completeness of reports is desirable, but not at the risk of including a body of data that appears to have an unreasonably high chance of significant errors.
Experience Reporting Requirements VM-50

6. Errors of a consistent nature are referred to as “systematic.” Incorrect coding instructions can introduce errors of a consistent nature. Programming errors within the data processing system of insurer company can also produce systematic miscoding as the system converts data to the required formats for experience reporting. Most systematic errors will produce data that, when reviewed using tests designed to reveal various types of systematic errors, will appear unreasonable and likely to be in error. In addition, some individual coding errors may produce erroneous results that show up when exposures and losses are compared in a systematic fashion. Such checking often cannot, however, provide a conclusive indication that data with unusual patterns is incorrect. The Experience Reporting Agent will perform tests and look at trends using previously reported data to determine if systematic errors or unusual patterns are occurring.

7. The Experience Reporting Agent will undertake reasonability checks that include the comparison of aggregate and company experience for underwriting class and type of coverage data elements for the current reporting period to company and aggregate experience from prior periods for the purpose of identifying potential coding or reporting errors. When reporting instructions are changed, newly reported data elements shall be examined to see that they correlate reasonably with data elements reported under the old instructions.

8. At a minimum, reasonability checks by the Experience Reporting Agent will include:
   a. An unusually large percentage of company data reported under a single or very limited number of categories;
   b. Unusual or unlikely reporting patterns in a company’s data;
   c. Claim amounts that appear unusually high or low for the corresponding exposures;
   d. Reported claims without corresponding policy values and exposures;
   e. Unreasonable loss frequencies or amounts in comparison to ranges of expectation that recognize statistical fluctuation;
   f. Unusual shifts in the distribution of business from one reporting period to the next.

9. If a company’s unusual pattern under Section 4.B.8.a, Section 4.B.8.b or Section 4.B.8.c is verified as accurate (that is, the reason for the apparent anomaly is an unusual mix of business), then it is not necessary that a similar pattern for the same company be reconfirmed year after year.

10. The Experience Reporting Agent will keep track of the results of the validity and reasonability checks and may adjust thresholds in successive reporting years to maintain a reasonable balance between the magnitude of errors being found and the cost to companies.

11. Results that may indicate a likelihood of critical indications, as defined below, will be reported to the company with an explanation of the unusual findings and their possible significance. When the possible or probable errors appear to be of a significant nature, the Experience Reporting Agent will indicate to the company that this is a “critical indication.” “Critical indications” are those that, if not corrected or confirmed, would leave a significant degree of doubt whether the affected data should be used in reports to the state insurance regulator and included in industry databases. It is intended that Experience Reporting Agents will have reasonable flexibility to implement this under the direction of the state insurance regulators. Also, under the direction of the state insurance regulators, the Experience Reporting Agent may grade the severity of indications, or it may simply
Experience Reporting Requirements VM-50

identify certain indications as critical. While companies are expected to undertake a reasonable examination of all indications provided to them, they are not required to respond to every indication except for those labeled by the Experience Reporting Agent as “critical.”

12. The Experience Reporting Agent will use its discretion regarding the omission of data from reports owing to the failure of an insurer company to respond adequately to unusual reasonability indications. Completeness of reports is desirable, but not at the risk of including data that appears to have an unreasonably high chance of containing significant errors.

13. Companies shall acknowledge and respond to reasonability queries from the Experience Reporting Agent. This shall include specific responses to all critical indications provided by the Experience Reporting Agent. Other indications shall be studied for apparent errors, as well as for indications of systematic errors. Corrections for critical indications shall be provided to the Experience Reporting Agent or, when a correction is not feasible, the extent and nature of the error shall be reported to the Experience Reporting Agent.

C. Ownership of Data

1. Experience data submitted by companies to the Experience Reporting Agent will be considered the property of the companies submitting such data, but the recognition of such ownership will not affect the ability of state insurance regulators or the NAIC to use such information as authorized by state laws based on Model #820 or the Valuation Manual, or, in case of state insurance regulators, for solvency oversight, financial examinations and financial analysis.

2. The Experience Reporting Agent will be responsible for maintaining data, error reports, logs and other intermediate work products, and reports for use in processing, documentation, production and reproduction of reports provided to state insurance regulators in accordance with the Valuation Manual. The Experience Reporting Agent will be responsible for demonstrating such reproducibility at the request of state insurance regulators or an auditor designated by state insurance regulators.

Section 5: Experience Data

A. Introduction

1. Using the data collected under statistical plans, as defined in the Valuation Manual, the Experience Reporting Agent produces aggregate databases as defined by this Valuation Manual. The Experience Reporting Agent, and/or other persons assisting the Experience Reporting Agent, will utilize those databases to produce industry experience tables and reports as defined in the Valuation Manual. In order to ensure continued relevance of reports, each defined data collection and resulting report structure shall be reviewed for usefulness at least once every five years since initial adoption or prior review.

2. Data compilations are evaluated according to four distinct, and often competing, standards: quality, completeness, timeliness and cost. In general, quality is a primary goal in developing any statistical data report. The priorities of the other three standards vary according to the purpose of the report.

3. The Experience Reporting Agent may modify or enlarge the requirements of the Valuation Manual, through recommendation to the Life Actuarial (A) Task Force or Health Actuarial (B) Task Force and in accordance with the Valuation Manual governance process for information to accommodate changing needs and environments. However, in most cases,
Experience Reporting Requirements VM-50

Changes to existing data reporting systems will be feasible only to provide information on future transactions. Requirements to submit new information may require that companies change their systems. Also, the Experience Reporting Agent may need several years before it can generate meaningful data meeting the new requirements with matching claims and insured amounts. The exact time frames for implementing new data requirements and producing reports will vary depending on the type of reports.

B. Design of Reports Linked to Purpose

Fundamental to the design of each report is an evaluation of its purpose and use. The Life Actuarial (A) Task Force and Health Actuarial (B) Task Force shall specify model reports responding to general regulatory needs. These model reports will serve the basic informational needs of state insurance regulators. To address a particular issue or problem, a state insurance regulator may have to request to the Life Actuarial (A) Task Force or Health Actuarial (B) Task Force that additional reports be developed.

C. Basic Report Designs

1. The Life Actuarial (A) Task Force or Health Actuarial (A) Task Force will designate basic types of reports to meet differing needs and time frames. Each statistical plan defined in VM-51 of the Valuation Manual will provide a detailed description of the reports, the frequency and time frame for the reports. Statistical compilations are anticipated to be the primary reports.

2. Statistical compilations are aggregate reports that generally match appropriate exposure amounts and transaction event amounts to evaluate the recent experience for a line of business. For example, a statistical compilation of mortality experience would match insurance face amounts exposed to death with actual death claims paid. Here the exposure amount is the total insurance face amount exposed to death, and the transaction event amounts would be the death claims paid. As another example, a statistical compilation of surrender experience would match total cash surrender amounts exposed to surrender with actual surrender amounts paid. Here the exposure amount is the total cash surrender amounts that could be surrendered, and the transaction event amounts would be the total surrender amounts actually paid. Statistical compilations can be performed for the industry or for the state of domicile.

3. In addition to statistical compilations, state insurance regulators can specify additional reports based on elements in the statistical plans in VM-51. State insurance regulators can also use statistical compilations and additional reports to evaluate non-formulaic assumptions.

4. The Life Actuarial (A) Task Force or Health Actuarial (B) Task Force will specify the reports to be provided to the professional actuarial associations to fulfill their roles as specified in Section 3.C of this VM-50. In general, the reports are expected to include statistical compilation at the industry level.

5. State insurance regulators can use the reports to review long-term trends. Aggregate experience results may indicate areas warranting additional investigation.

D. Supplemental Reports

1. For specific lines of business and types of experience data, state insurance regulators may request additional reports from the Experience Reporting Agent. State insurance regulators also may request custom reports, which may contain specific data or experience not regularly produced in other reports.
Experience Reporting Requirements VM-50

2. The regulator and the Experience Reporting Agent must negotiate time schedules for producing supplemental reports. The information in these reports is limited by the amount of data actually available and the manner in which it has been reported.

E. Reports to State Insurance Departments

The Experience Reporting Agent will periodically provide the following reports to state insurance departments:

1. A list of companies whose data is included in the compilation.
2. A list of companies whose data was excluded from the compilation because it fell outside of the tolerances set for missing or invalid data, or for any other reason.

Section 6: Confidentiality of Data

A. Confidentiality of Experience Data

1. The confidentiality of the experience data, experience materials and related information collected pursuant to the Valuation Manual is governed by state laws based on Section 14.A.(5) of Model #820. The following information is considered “confidential information” by state laws based on Section 14A(5) of the Model #820:

   Any documents, materials, data and other information submitted by a company under Section 13 of [the Standard Valuation Law] (collectively, “experience data”) and any other documents, materials, data and other information, including, but not limited to, all working papers, and copies thereof, created or produced in connection with such experience data, in each case that include any potentially company-identifying or personally identifiable information, that is provided to or obtained by the commissioner (together with any “experience data,” the “experience materials”) and any other documents, materials, data and other information, including, but not limited to, all working papers, and copies thereof, created, produced or obtained by or disclosed to the commissioner or any other person in connection with such experience materials.

2. Nothing in the experience reporting requirements or elsewhere within the Valuation Manual is intended to, or should be construed to, amend or supersede any applicable statutory requirements, or otherwise require any disclosure of confidential data or materials that may violate any applicable federal or state laws, rules, regulations, privileges or court orders applicable to such data or materials.

B. Treatment of Confidential Information

1. Confidential information may be shared only with those individuals and entities specified in state laws based on Section 14B(3) of Model #820. Any agreement between a state insurance department and the Experience Reporting Agent will address the extent to which the Experience Reporting Agent is authorized to share confidential information consistent with state law.

2. The Experience Reporting Agent may be required to use confidential information in order to prepare compilations of aggregated experience data that do not permit identification of individual company experience or personally identifiable information. These reports of aggregated information, including those reports referenced in Section 5 of VM-50, are not considered confidential information, and the Experience Reporting Agent may make publicly available such reports. Reports using aggregate experience data will have
Experience Reporting Requirements

sufficient diversification of data contributors to avoid identification of individual companies.

3. Consistent with state laws based on Section 14B(3) of the Model #820 and any agreements between a state insurance department and the Experience Reporting Agent, access to the confidential information will be limited to:
   
a. State, federal or international regulatory agencies;

b. The company with respect to confidential information it has submitted, and any reports prepared by the Experience Reporting Agent based on such confidential information;

c. The NAIC, and its affiliates and subsidiaries;

d. Auditor(s) of the Experience Reporting Agent for purposes of the experience reporting function outlined in this VM-50; and

e. Other individuals or entities, including contractors or subcontractors of the Experience Reporting Agent, otherwise assisting the Experience Reporting Agent or state insurance regulators in fulfilling the purposes of VM-50. These other individuals or entities may provide services related to a variety of areas of expertise, such as assisting with performing industry experience studies, developing valuation mortality tables, data editing and data quality review. These other individuals and entities shall be subject to the same standards as the Experience Reporting Agent with respect to the maintenance of confidential information.

Section 1: Introduction

A. The experience reporting requirements are defined in Section 3 of VM-50. The experience reporting requirements state that the Experience Reporting Agent will collect experience data based on statistical plans that are defined in VM-51 of the Valuation Manual. Statistical plans are to be added to VM-51 of the Valuation Manual when they are ready to be implemented.

B. Each statistical plan shall contain the following information:

1. The type of experience data to be collected (e.g., mortality experience; policy behavior experience, such as surrenders, lapses, conversions, premium payment patterns, etc.; and company expense experience, such as commission expense, policy issue and maintenance expense, company overhead expenses etc.);

2. The scope of business to be included in the experience data to be collected (e.g., line(s) of business, such as individual or group, life, annuity or health; product type(s), such as term, whole life, universal life, indexed life, variable life, fixed annuity, indexed annuity, variable annuity, LTC or disability income; and type of underwriting, such as medically underwritten, simplified issue (SI), GI, accelerated, etc.);

3. The criteria for determining which companies or legal entities must submit the experience data to be collected;

4. The process for submitting the experience data to be collected, which will include the frequency of the data collection, the due dates for data collection and how the data is to be submitted to the Experience Reporting Agent;

5. The individual data elements and format for each data element that will be contained in each experience data record, along with detailed instructions defining each data element or how to code each data element. Additional information may be required, such as questionnaires and plan code forms that will assist in defining the individual data elements that may be unique to each company or legal entity submitting such experience data elements;

6. The experience data reports to be produced.

Section 2: Statistical Plan for Mortality

A. Type of Experience Collected Under This Statistical Plan
Experience Reporting Formats

VM-51

The type of experience to be collected under this statistical plan is mortality experience.

B. Scope of Business Collected Under This Statistical Plan

1. The data for this statistical plan is the individual ordinary life line of business. Such business is to include direct written business issued in the U.S. and All values should be prior to any reinsurance ceded except for the situation defined in VM-51 Section 2.B.2. Therefore, reinsurance assumed from a ceding company shall be excluded from data collection to avoid double counting of experience submitted by an issuer and by its reinsurers; however, Assumption reinsurance of an individual ordinary life line of business, where the assuming company is legally responsible for all benefits and claims paid, shall be included within the scope of this statistical plan. The ordinary life line of business does not include separate lines of business, such as SI/GI, worksite, individually solicited group life, direct response, final expense, preneed, home service, credit life, and corporate-owned life insurance (COLI)/bank-owned life insurance (BOLI)/charity-owned life insurance (CHOLI).

2. In the event a reinsurer or third-party administrator is responsible for administering a block of business, the reinsurer or third-party administrator may submit that block of business on behalf of the direct writer. In this case the reinsurer or third-party administrator must be identified in Appendix 4 Item 1 - Submitting Company ID, and the direct writer must be identified in Appendix 4 Item 2 - NAIC Company Code of Direct Writer.

   a. As defined in VM-50 Section 4.B.3, the reconciliation to company statistical and financial data for both the direct writing company and all reinsurers and/or third-party administrators must include lines indicating the amount of business that is being reported by the reinsurers and/or third-party administrators. The Experience Reporting Agent will compare the reconciliations for all business submitted by the direct writer and any reinsurers and/or third-party administrators to ensure that all business is included and there is no double counting of policies.

   b. If an insurance company is required to submit their direct written business and they also have reinsurance assumed business, they should only submit the assumed business if asked to do so by the ceding company since some ceding companies may not have been selected for data submission.

3. The direct writing company is ultimately responsible for all the data submitted for their company.

C. Criteria to Determine Companies That Are Required to Submit Experience Data

Companies with less than $50 million of direct individual life premium shall be exempted from reporting experience data required under this statistical plan. This threshold for exemption shall be measured based on aggregate premium volume of all affiliated companies and shall be reviewed annually and be subject to change by the Experience Reporting Agent. At its option, a group of nonexempt affiliated companies may exclude from these requirements affiliated companies with less than $10 million direct individual life premium provided that the affiliated group remains nonexempt.

Additional exemptions may be granted by the Experience Reporting Agent where appropriate, following consultation with the domestic insurance regulator, based on achieving a target level of approximately 85% of industry experience for the type of experience data being collected under this statistical plan.
D.  Process for Submitting Experience Data Under This Statistical Plan

Data for this statistical plan for mortality shall be submitted on an annual basis. Each company required to submit this data shall submit the data using the Regulatory Data Collection (RDC) online software submission application developed by the Experience Reporting Agent. For each data file submitted by a company, the Experience Reporting Agent will perform reasonability and completeness checks, as defined in Section 4 of VM-50, on the data. The Experience Reporting Agent will notify the company within 30 days following the data submission of any possible errors that need to be corrected. The Experience Reporting Agent will compile and send a report listing potential errors that need correction to the company.

Data for this statistical plan for mortality will be compiled using a calendar year method. The reporting calendar year is the calendar year that the company submits the experience data. The observation calendar year is the calendar year of the experience data that is reported. The observation calendar year will be two years prior to the reporting calendar year. For example, if the current calendar year is 2018 and that is the reporting calendar year, the company is to report the experience data that was in-force or issued in calendar year 2016, which is the observation calendar year.

Given an observation calendar year of 20XX, the calendar year method requires reporting of experience data as follows:

i. Report policies in force during or issued during calendar year 20XX.

ii. Report terminations that were incurred in calendar year 20XX and reported before July 1, 20XX+1. However, exclude rescinded policies (e.g., 10-day free look exercises) from the data submission.

For any reporting calendar year, the data call will occur during the second quarter, and data is to be submitted according to the requirements of the Valuation Manual in effect during that calendar year. Data submissions must be made by Sept. 30 of the reporting calendar year. Corrections of data submissions must be completed by Dec. 31 of the reporting calendar year.

E. Experience Data Elements and Formats Required by This Statistical Plan

Companies subject to reporting pursuant to the criteria stated in Section 2.C are required to complete the data forms in Appendix 1, Appendix 2 and Appendix 3 as appropriate, and also complete the Experience Data Elements and Formats as defined in Appendix 4.

The data should include policies issued as standard, substandard (optional) or sold within a preferred class structure. Preferred class structure means that, depending on the underwriting results, a policy could be issued in classes ranging from a best preferred class to a residual standard class. Policies issued as part of a preferred class structure are not to be classified as substandard.

Policies issued as conversions from term or group contracts should be included. For these converted policies, the issue date should be the issue date of the converted policy, and the underwriting field will identify them as issues resulting from conversion.

Generally, each policy number represents a policy issued as a result of ordinary underwriting. If a single life policy, the base policy on a single life has the policy number and a segment number of 1. On a joint life policy, each life has separate records with the same policy number. The base policy on the first life has a segment number of 1, and the base policy on the second life has a segment number of 2. Policies that cover more than two lives are not to be submitted.
Experience Reporting Formats  VM-51

Term/paid up riders or additional amounts of insurance purchased through dividend options on a policy issued as a result of ordinary underwriting are to be submitted. Each rider is on a separate record with the same policy number as the base policy and has a unique segment number. The details on the rider record may differ from the corresponding details on the base policy record. If underwriting in addition to the base policy underwriting is done, the coverage is given its own policy number.

Terminations (both death and non-death) are to be submitted. Terminations are to include those that occurred in the observation year and were reported by June 30 of the year after the observation year.

Plans of insurance should be carefully matched with the three-digit codes in item 19, Plan. These plans of insurance are important because they will be used not only for mortality experience data collection, but also for policyholder behavior experience data collection. It is expected that most policies will be matched to three-digit codes that specify a particular policy type rather than select a code that indicates a general plan type.

Each company is to submit data for in-force and terminated life insurance policies that are within the scope defined in Section 2.B except:

i. For policies issued before Jan. 1, 1990, companies may certify that submitting data presents a hardship due to fields not readily available in their systems/databases or legacy computer systems that continue to be used for older issued policies and differ from computer systems for newer issued policies.

ii. For policies issued on or after Jan. 1, 1990, companies must:
   a) Document the percentage that the face amount of policies excluded are relative to the face amount of submitted policies issued on or after Jan. 1, 1990; and
   b) Certify that this requirement presents a hardship due to fields not readily available in their systems/databases or legacy computer systems that continue to be used for older issued policies and differ from computer systems for newer issued policies.

F. Experience Data Reports Required by This Statistical Plan

1. Using the data collected under this statistical plan, the Experience Reporting Agent will produce an experience data report that aggregates the experience data of all companies whose data have passed all of the validity and reasonableness checks outlined in Section 4 of VM-50 and has been determined by the Experience Reporting Agent to be acceptable to be used in the development of industry mortality experience.

2. The Experience Reporting Agent will provide to the SOA or other actuarial professional organizations an experience data report of aggregated experience that does not disclose a company’s identity, which will be used to develop industry mortality experience and valuation mortality tables.
3. As long as a company is licensed in a state, that state insurance regulator will be given access to a company’s experience data that is stored on a confidential database at the Experience Reporting Agent. Access by the state insurance regulator will be controlled by security credentials issued to the state insurance regulator by the Experience Reporting Agent.
Appendix 1: Preferred Class Structure Questionnaire

PREFERRED CLASS STRUCTURE QUESTIONNAIRE

Fill out this preferred class structure questionnaire based on companywide summaries, such as underwriting guideline manuals, compilations of issue instructions or other documentation.

The purpose of this preferred class structure questionnaire is to gather information on different preferred class structures. This questionnaire varies between nonsmoker/non-tobacco and smoker/tobacco users and provides for variations by issue year, face amount and plan. If the company has the standard Relative Risk Score (RR Score) information available, the company should map its set of preferred class structure to sets of RR Scores. Except for new preferred class structures or new sets of RR Scores applied to existing preferred class structure(s), the response to the questionnaire should remain the same from year to year.

If a company has determined sets of RR Scores for its preferred class structures, it should provide separate preferred class structure responses for each set of RR Scores applied to a preferred class structure. If a company has not determined sets of RR Scores for its preferred class structures, it should fill out this questionnaire with its preferred class structures and update the preferred class structure questionnaire at such future time that sets of RR Scores for the preferred class structures are determined. When sets of RR Scores are used, there is to be a one-to-one correspondence between a preferred class structure and a set of RR Scores.

The information given in this questionnaire will be used both to map a set of RR Scores to policy level data and as a check on the policy-level data submission. Submit this questionnaire along with the initial data submission to the Experience Reporting Agent.

Each preferred class structure must include at least two classes (e.g., one preferred class and one standard class). Make as many copies of this preferred class structure questionnaire as necessary for your individual life business and submit in addition to policy-level detail information.

</table>

MORTALITY CLAIMS

1. If the data is provided using a reporting run-out that is other than six months, what run-out period was used? mm/dd/yyyy

2. The death claim amounts are to be for the total face amount and on a gross basis (before reinsurance). The data is based on:
   a. Total face amount (for policies that include the cash value in addition to the face amount as a death benefit, use only the face amount) as specified OR Other (describe):
      If not as specified, indicate time period for which this occurred ___________ - _______
   b. Gross basis (before reinsurance) as specified OR Other (describe):
      If not as specified, indicate time period for which this occurred: ___________ - _______
      Is this the same basis used for face amounts included in the study data? Yes No

3. The date that the termination is reported is to be used for the termination reported date. The date that the termination actually occurred is to be used for the actual termination date. What dates are used for death claims in the study data with respect to?
   a) Termination reported date
      If not reported date, indicate basis for dates provided
      Reported date Other (describe):
   b) Actual termination date for death claims:
      Date of death Other (describe):
      If not date of death, indicate basis for dates provided

4. Death claims pending at the end of the observation period but paid during the subsequent six months following the observation year are to be included in the data submission. Claims that are still pending at the end of the six month run out are - to be included.
Experience Reporting Formats

Are such pending claims included in the study data?  Yes  No

If no indicate time period for which this occurred: __________________

5. The face amounts and death claim amounts are to be included without capping by amount. Are the face amounts and death claims/exposures included without capping by amount?

   Yes  No

If No, describe how face amounts and death claims are capped and at what amount the capping is being done.

6. For death claims on policies issued before 1990:

   Are death claims matched up to a corresponding in-force policy?  Yes  No

   If no, indicate approach used:

7. Please briefly describe any other unique aspects of the death claims data that are not covered above.
Appendix 3: Additional Plan Code Form

If you need an additional plan code(s) for a product(s) in addition to those plan codes in Item 19, Plan, of the statistical plan for life insurance mortality, fill in this form using plan codes in the range 300 to 999. Your data submission should reflect the plan codes in this form. Make as many copies as necessary for your individual life business and submit in addition to policy-level information. When this form is used, it must be sent to the Experience Reporting Agent at the time that data is submitted.

The Life Actuarial (A) Task Force met May 20, 2021. The following Task Force members participated: Doug Slape, Chair, represented by Mike Boerner, Rachel Hemphill, and Karen Jiang (TX); Judith L. French, Vice Chair, represented by Peter Weber (OH); Lori K. Wing-Heier represented by Sharon Comstock (AK); Jim L. Ridling represented by Jennifer Li and Steve Ostlund (AL); Ricardo Lara represented by Ben Bock and Perry Kupferman (CA); Michael Conway represented by Eric Unger (CO); Andrew N. Mais represented by Wanchin Chou (CT); Doug Ommen represented by Mike Yanacheak (IA); Dana Popish Severinghaus represented by Bruce Sartain and Vincent Tsang (IL); Stephen W. Robertson represented by Karl Knable (IN); Grace Arnold represented by Fred Andersen and John Robinson (MN); Chlora Lindley-Myers represented by William Leung (MO); Eric Dunning represented by Rhonda Ahrens (NE); Marlene Caride represented by Kevin Clarkson (NJ); Linda A. Lacewell represented by Bill Carmello and Amanda Fenwick (NY); Glen Mulready represented by Andrew Schallhorn (OK); Jonathan T. Pike represented by Tomasz Serbinowski (UT); and Scott A. White represented by Craig Chupp (VA).

1. Discussed the Memorandum on Current ESG Work

Mr. Boerner discussed the memorandum (Attachment A) from the Task Force and the Life Risk-Based Capital (E) Working Group on the current economic scenario generator (ESG) work. He said the memorandum documents the Task Force and Working Group’s goal of transparency in communicating the progress on the ESG project to state insurance regulators and interested parties. He said there will be no ESG field test in 2021. He said industry subject matter experts (SMEs) will be invited to contribute to future ESG drafting group discussions. He said the Task Force will provide more frequent updates to better inform interested parties.

2. Adopted Amendment Proposal 2021-05

William Wilton (unaffiliated) discussed his comment letter (Attachment B) on amendment proposal 2021-05. He said the letter recommends making changes to only VM-31, PBR Actuarial Report Requirements for Business Subject to a Principle-Based Valuation, and proposes no changes be made to VM-20, Requirements for Principle-Based Reserves for Life Products, or VM-21, Requirements for Principle-Based Reserves for Variable Annuities. He said using the term “modeled company investment strategy” in VM-31 creates problems. He said he recommends replacing it with “modeled investment strategy” or “alternative investment strategy” as the appropriate terms. He further indicated that a subsequent amendment to remove the investment advisor certification requirement should be considered. David Neve (Actuarial Resources Corporation of Georgia—ARC-GA) said changes to VM-20 and VM-21 are necessary for consistency in defining the weighted average life. He said companies are misinterpreting the modeled company investment strategy referenced in VM-31 as the winning strategy. He agreed that clarification of the modeled company investment strategy is necessary.

Mr. Carmello made a motion, seconded by Mr. Robinson, to adopt amendment proposal 2021-05 (Attachment C). The motion passed unanimously.

3. Re-Exposed Amendment Proposal 2020-12

Brian Bayerle (American Council of Life Insurers—ACLI) said the ACLI comment letter (Attachment D) recognizes that a company may have valid reasons for choosing not to model a clearly defined hedging strategy (CDHS). He said amendment proposal 2020-12 seems to suggest that some CDHS strategies are not legitimate. He said the amendment proposal introduces new concepts that change the treatment of current and future hedges. He said the current version of the amendment proposal introduces additional ambiguities. He said the ACLI supports the intent of the amendment proposal but would like to see the ambiguities clarified. He noted that the ACLI comment letter provides suggested changes to address optionality within the CDHS.

Ms. Hemphill said the ACLI revisions to the amendment proposal are not acceptable because they preserve and add complexity to the current optionality. She said the optionality makes regulatory evaluation of a CDHS difficult. She said the proposal fails to address the issue of the inconsistency of the current CDHS treatment with the general principles of principle-based reserving (PBR) defined in the Guidance Note in Section 7.K.1 of VM-20. She disagreed with the ACLI notion that the amendment proposal requirement to reflect hedging suggests that certain hedging strategies are not legitimate. Ms. Jiang responded to the
ACLI general concern No. 2 related to differences in current treatment versus proposed treatment of hedges. She said the ACLI chart on Page 3 of its comment letter provides an inaccurate comparison of the proposed and current treatment. She said Section 7.K.1 of VM-20 provides requirements for future transactions for both CDHS and non-hedging derivatives. She noted that the amendment proposal does not affect any requirements for non-hedging derivatives programs. She said the amendment proposal better aligns the treatment of CDHS and non-hedging transactions.

Ms. Hemphill said the amendment proposal was revised to reflect the technical concerns posed by the ACLI, including a clarification that the principles addressed in the proposal apply to the modeling of the CDHS and not to the CDHS itself. She and Ms. Jiang disagreed with other items that the ACLI contends are potentially confusing.

Mr. Robinson shared that his comment letter (Attachment E) highlights that principle No. 2 requires all income, benefit, and expense items be included in the modeling. He said modeling a CDHS or seasoned hedging strategy (SHS) only under certain circumstances violates principle No. 2. He said the relationship of the SHS and CDHS should be clarified. Ms. Jiang said the amendment proposal incorporated most of the editorial changes Mr. Robinson proposed.

Mr. Sartain made a motion, seconded by Mr. Robinson, to re-expose amendment proposal 2020-12 (Attachment F) for a 21-day public comment period ending June 11. The motion passed unanimously.

Having no further business, the Life Actuarial (A) Task Force adjourned.
TO: Life Actuarial (A) Task Force
   Life Risk-Based Capital (E) Working Group
FROM: Mike Boerner (TX)
       Phil Barlow (DC)
RE: Current Work on Economic Scenario Generator
DATE: May 20, 2021

It has been brought to our attention that certain interested parties and members of the life insurance industry have concerns regarding work currently being conducted by the NAIC regulator ESG Drafting Group on the development and implementation of an Economic Scenario Generator (ESG) for life reserving and risk-based capital purposes. Specifically, there have been concerns expressed with respect to (1) the proposed timeline of conducting field testing and implementation of the ESG for use on January 1, 2022; (2) the lack of transparency of the work being conducted by the ESG Drafting Group; and (3) the lack of opportunity for specific industry input into the drafting process. We consider these to be valid concerns, and would like to address them specifically with the following statements:

1. We think it is important for everyone to know that the NAIC, Life Actuarial (A) Task Force and the Life Risk-Based Capital (E) Working Group are dedicated to producing a working ESG that meets the expectations of both the regulatory and interested party communities, and that sufficient time and effort will be devoted to this process. Therefore, we are officially extending the timeline for its completion, and advising you that there will be no field test in 2021 and the ESG will not be ready for implementation as of January 1, 2022.

2. We understand that there have been no public discussions on the ESG or work of the Drafting Group since the Spring National Meeting. The Drafting Group cannot make decisions on behalf of the Task Force, and any recommendations that may come from the Drafting Group would be openly discussed on open calls with opportunity for industry input. That being said, we will try to provide updates to interested parties on the progress of the Drafting Group on a regular basis.

3. Finally, we agree that more industry input would be helpful at this stage of the process, and we are reaching out to the American Academy of Actuaries and American Council of Life Insurers to help provide more meaningful input and expert advice to the Drafting Group at this time.

Thank you for everyone’s patience as we proceed forward with the ESG project.

Re: APF 2021-05, Investment Strategy

I appreciate the opportunity to provide comments on Amendment Proposal Form 2021-05 submitted by David Neve.

Although I agree that the language needs to be cleaned-up or tightened up a little bit, I generally disagree with modifying VM-01, VM-20 or VM-21.

Investment strategy is used, based on my count, 42 times in VM-20, VM-21, and VM-31. Model Investment Strategy 10 times (6 in VM-20, 2 in VM-21, & 2 in VM-31.) Modeled Company Investment Strategy is used 5 times in VM-31. I believe clarification of the documentation requirements in VM-31 is all that is necessary. The use of “Modeled Company Investment Strategy” creates problems in VM-31 and is why I disagree that this is or should be the “preferred” term.

In my view, there is a modeled investment strategy. If we want to be more specific it is the company’s modeled investment strategy. I think it is inappropriate and confusing to refer to it as the “Modeled Company Investment Strategy” and therefore disagree with the term and its inclusion in VM-01. As is evident in VM-20, the “Company Investment Strategy” may not be modeled, rather as articulated in VM-20 Section 7.E.1.a:

“The model investment strategy may incorporate a representation of the actual investment policy that ranges from relatively complex to relatively simple. In any case, the PBR Actuarial Report shall include documentation supporting the appropriateness of the representation relative to actual investment policy.”

I personally do not find the confusion with model investment strategy and alternative investment strategy (7 instances). In fact, the first instance in VM-20 states:

“Notwithstanding the above requirements, the modeled reserve shall be the higher of that produced by the model investment strategy and that produced by substituting an alternative investment strategy…”
A similar instance is also shown in VM-21. Clearly, model investment strategy is different than alternative investment strategy. The remaining 5 instances are all in VM-31. With the exception of the VM-20 certification of the qualified actuary on investments, model investment strategy is in the same sentence as alternative investment strategy. For reference purpose, if clarification is needed, the word “company’s” should precede “model investment strategy”, not inserted in the middle of it.

It is also important to recognize that a company may have multiple investment strategies; different strategies for different products or lines of business. Therefore, the modeled investment strategy should be viewed in the context of the model. As drafting takes place for VM-22, we can continue to tighten up the language around model investment strategy because in principal, there should be no difference between VM-20, VM-21, or VM-22.

So how do we fix/clarify VM-31?

For Section 3.D.6.r., I propose we replace with:

**Modeled Investment Strategy** – Description of the company’s modeled investment strategy, including asset reinvestment and disinvestment assumptions, and document the appropriateness compared to the actual investment policy of the company.

For Section 3.D.6.s., consistent with the APF, I propose relabeling as “Alternative Investment Strategy” to be consistent with the label in Section 3.F.6.b., but modify the wording slightly.

**Alternative Investment Strategy** – Demonstration of compliance with VM-20 Section 7.E.1.g., showing that the modeled reserve is the higher of that produced using the company’s modeled investment strategy and the alternative investment strategy.

Ideally, Section 3.F.6.a. and b. should mirror the recommendation to Section 3.D.6.r. and s. above.

**Modeled Investment Strategy** – Description of the company’s modeled investment strategy, including asset reinvestment and disinvestment assumptions, and document the appropriateness compared to the actual investment policy of the company.

**Alternative Investment Strategy** – Demonstration of compliance with VM-21 Section 4.D.4.b., showing that the modeled reserve is the higher of that produced using the company’s modeled investment strategy and the alternative investment strategy.

“Modeled Company Investment Strategy” is also used in Section 3.D.14.a. (Certifications, Investment Officer on Investments). At a minimum, “Company” should be deleted. I would
further argue that the required certification should be eliminated. It is the role of the actuary to
document what is in the model and ensure that the modeled investment strategy is consistent with
the company’s investment policy. As stated in VM-20 Section 7.E.1.a.:

“... the PBR Actuarial Report shall include documentation supporting the
appropriateness of the representation relative to actual investment policy.”

I view this as a different requirement than having an individual that is not familiar with the actual
model or the dynamics of a model to “certify” that “the modeled investment strategy is
representative of and consistent with the company’s investment policy”. Actuaries have the
responsibility of the model and will have conversations with the investment area to ensure that the
assumptions in the model are appropriate given the purpose of the model. Would the domiciliary
commissioner feel comfortable providing a certification that the modeled reserve complies with
VM-20 or VM-21, whichever is applicable? If not, why are we asking the investment officer to
certify what is in the model? I believe the corporate elements of the principle-based valuation
should be handled by VM-G and not also infused into and modified by VM-31.

In addition, VM-31, Section F.16.a. should also be eliminated. The investment certification is
even more problematic because it uses “company’s current investment strategy” when it should
have stated “company’s investment policy”. It also uses modeled reinvestment strategy as opposed
to investment strategy.

I thank you for the opportunity to provide the comments on this exposure and work to provide
enhancements to the Valuation Manual to continue the process of eliminating unintended
ambiguities that may have made their way into the Valuation Manual.

Sincerely,

William H. Wilton, CFA, FSA, MAAA
Life Actuarial (A) Task Force/ Health Actuarial (B) Task Force

Amendment Proposal Form*

1. Identify yourself, your affiliation and a very brief description (title) of the issue.

Identification: David Neve, VP and Consulting Actuary, Actuarial Resources Corporation

Title of the Issue: Clarify the definition of modeled company investment strategy and the comparison to the alternative investment strategy.

2. Identify the document, including the date if the document is “released for comment,” and the location in the document where the amendment is proposed:

January 1, 2020 NAIC Valuation Manual
- VM-01 VM-21 Section 4.D

3. Show what changes are needed by providing a red-line version of the original verbiage with deletions and identify the verbiage to be deleted, inserted or changed by providing a red-line (turn on “track changes” in Word*) version of the verbiage. (You may do this through an attachment.)

See attached.

4. State the reason for the proposed amendment? (You may do this through an attachment.)

There is an inconsistency in VM-20/VM-21 and VM-31 regarding the term “model investment strategy”. The term “model investment strategy” is used throughout VM-20 and VM-21 to describe the investment strategy used in the model as a proxy for the company’s actual investment strategy. However, VM-31 uses the term “modeled company investment strategy” in several places rather than “model investment strategy”. “Modeled company investment strategy” is the preferred term, so VM-20 and VM-21 have been modified to use “modeled company investment strategy” so that the terminology in VM-20, VM-21 and VM-31 are consistent.

Also, to address the ambiguity of whether the final investment strategy in the model is the initial investment strategy based on the company’s investment strategy or the alternative investment strategy when the alternative strategy is constraining, the term “modeled company investment strategy” has been added to the definitions in VM-01 (and a parenthetical has been added to VM-31) to clarify that the term refers to the investment strategy in the model prior to comparison to the alternative investment strategy. In addition, VM-21 has been modified to be consistent with the wording in VM-20 to clarify that the assets in the alternative investment strategy should use the same weighted average life (WAL) as the assets in the modeled company investment strategy.
VM-01 Changes:
VM-01 provides definitions for terms used in the Valuation Manual. The definitions in VM-01 do not apply to documents outside the Valuation Manual even if referenced or used by the Valuation Manual, such as the AP&P Manual. Some terms in the Valuation Manual may be defined in specific sections of the Valuation Manual instead of being defined in VM-01.

- The term “margin” means an amount included in the assumptions used to determine the modeled reserve that incorporates conservatism in the calculated value consistent with the requirements of the various sections of the Valuation Manual. It is intended to provide for estimation error and adverse deviation.

- The term “modeled company investment strategy” means the investment strategy used in the model that is intended to be a representation of the actual investment strategy of the company. It is before the comparison is made to the alternative investment strategy. It does not refer to the alternative investment strategy when the alternative investment strategy is constraining.

- The term “modeled reserve” means the deterministic reserve on the policies determined under VM-20 Section 2.A.1.a, 2.A.2.a and 2.A.3.b, plus the greater of the deterministic reserve and the stochastic reserve on the policies determined under Section 2.A.1.b, 2.A.2.b and 2.A.3.c.

VM-20 Changes:

Section 7: Cash-Flow Models
E. Reinvestment Assets and Disinvestment

1. At the valuation date and each projection interval as appropriate, model the purchase of general account reinvestment assets with available cash and net asset and liability cash flows in a manner that is representative of and consistent with the company’s investment policy for each model segment, subject to the following requirements:

   a. The modeled company investment strategy may incorporate a representation of the actual investment policy that ranges from relatively complex to relatively simple. In any case, the PBR Actuarial Report shall include documentation supporting the appropriateness of the representation relative to actual investment policy.

   b. The final maturities and cash-flow structures of assets purchased in the model, such as the patterns of gross investment income and principal repayments or a fixed or floating rate interest basis, shall be determined by the company as part of the model representation.

   c. The combination of price and structure for fixed income investments and derivative instruments associated with fixed income investments shall appropriately reflect the then-current U.S. Department of the Treasury (Treasury Department) curve along the relevant scenario and the requirements for gross asset spread assumptions stated below.

   d. For purchases of public non-callable corporate bonds, use the gross asset spreads over Treasuries prescribed in Section 9.F.8.a through Section 9.F.8.c. (For purposes of this
subsection, “public” incorporates both registered and 144a securities.) The prescribed
spreads reflect current market conditions as of the model start date and grade to long-
term conditions based on historical data at the start of projection year four.

e. For transactions of derivative instruments associated with fixed income investments,
reflect the prescribed assumptions in Section 9.F.8.d for interest rate swap spreads.

f. For purchases of other fixed income investments, if included in the modeled company
investment strategy, set assumed gross asset spreads over Treasuries in a manner that is
consistent with, and results in reasonable relationships to, the prescribed spreads for
public non-callable corporate bonds and interest rate swaps as defined in Section 9.F.8.

g. Notwithstanding the above requirements, the modeled reserve shall be the higher of that
produced by the modeled company investment strategy and that produced by
substituting an alternative investment strategy in which the fixed income reinvestment
assets have the same weighted average life (WAL) as the reinvestment assets in the
modeled company investment strategy and are all public non-callable corporate bonds
with gross asset spreads, asset default costs and investment expenses by projection year
that are consistent with a credit quality blend of 50% PBR credit rating 6 (A2/A) and
50% PBR credit rating 3 (Aa2/AA).

Policy loans, equities and derivative instruments associated with the execution of a
clearly defined hedging strategy (in compliance with Section 7.L) are not affected by
this requirement.

Guidance Note: VM-31 requires a demonstration of compliance with VM-20 Section 7.E.1.g. In many
cases, particularly if the modeled company investment strategy does not involve callable assets, it is
expected that the demonstration of compliance will not require running the reserve calculation twice.
For example, an analysis of the weighted average net reinvestment spread on new purchases by
projection year (gross spread minus prescribed default costs minus investment expenses) of the modeled
company investment strategy compared to the weighted average net reinvestment spreads by projection
year of the alternative strategy may suffice. The assumed mix of asset types, asset credit quality or the
levels of non-prescribed spreads for other fixed income investments may need to be adjusted to achieve
compliance.

VM-21 Changes:

Section 4: Determination of the Stochastic Reserve

D. Projection of Assets

4. General Account Assets

a. General account assets shall be projected, net of projected defaults, using assumed
investment returns consistent with their book value and expected to be realized in future
periods as of the date of valuation. Initial assets that mature during the projection and
positive cash flows projected for future periods shall be invested in a manner that is
representative of and consistent with the company’s investment policy, subject to the
following requirements:

i. The final maturities and cash flow structures of assets purchased in the model,
such as the patterns of gross investment income and principal repayments or a
fixed or floating rate interest basis, shall be determined by the company as part of the model representation;

ii. The combination of price and structure for fixed income investments and derivative instruments associated with fixed income investments shall appropriately reflect the projected Treasury Department curve along the relevant scenario and the requirements for gross asset spread assumptions stated below;

iii. For purchases of public non-callable corporate bonds, follow the requirements defined in VM-20 Sections 7.E, 7.F and 9.F. The prescribed spreads reflect current market conditions as of the model start date and grade to long-term conditions based on historical data at the start of projection year four;

iv. For transactions of derivative instruments associated with fixed income investments, reflect the prescribed assumptions in VM-20 Section 9.F for interest rate swap spreads;

v. For purchases of other fixed income investments, if included in the modeled company investment strategy, set assumed gross asset spreads over U.S. Treasuries in a manner that is consistent with, and results in reasonable relationships to, the prescribed spreads for public non-callable corporate bonds and interest rate swaps.

b. Notwithstanding the above requirements, the stochastic reserve shall be the higher of that produced by the modeled company investment strategy and that produced by substituting an alternative investment strategy in which the fixed income reinvestment assets have the same weighted average life (WAL) as the reinvestment assets in the modeled company investment strategy and are all public non-callable corporate bonds with gross asset spreads, asset default costs, and investment expenses by projection year that are consistent with a credit quality blend of 50% PBR credit rating 6 (A2/A) and 50% PBR credit rating 3 (Aa2/AA).

Policy loans, equities and derivative instruments associated with the execution of a clearly defined hedging strategy are not affected by this requirement.

Drafting Note: This limitation is being referred to Life Actuarial (A) Task Force for review.

VM-31 Changes:

Section 3: PBR Actuarial Report Requirements

D. Life Report – This subsection establishes the Life Report requirements for individual life insurance policies valued under VM-20.

6. Assets – The following information regarding the asset assumptions used by the company in performing a principle-based valuation under VM-20:

r. Modeled Company Investment Strategy and Reinvestment Assumptions – Description of the modeled company investment strategy (before comparison to the alternative investment strategy), including asset reinvestment and disinvestment assumptions, and
documentation supporting the appropriateness of the modeled company investment strategy compared to the actual investment policy of the company.

s. **Alternative Investment Strategy** – Documentation demonstrating compliance with VM-20 Section 7.E.1.g, showing that the modeled reserve is the higher of that produced using the modeled company investment strategy and the alternative investment strategy.

F. **VA Report** – This subsection establishes the VA Report requirements for variable annuity contracts valued under VM-21.

6. **General Account Assets** – The following information regarding the general account asset assumptions used by the company in performing a principle-based valuation under VM-21:

a. **Modeled Company Investment Strategy and Reinvestment Assumptions** – Description of the modeled company investment strategy (before the comparison to the alternative investment strategy), including asset reinvestment and disinvestment assumptions, and documentation supporting the appropriateness of the modeled company investment strategy compared to the actual investment policy of the company.

b. **Alternative Investment Strategy** – Documentation demonstrating compliance with VM-21 Section 4.D.4.b showing that the stochastic reserve is the higher of that produced using the modeled company investment strategy and the alternative investment strategy, based on the limitations defined in VM-21 Section 4.D.4.b.
Dear Mr. Boerner:

The American Council of Life Insurers (ACLI) appreciates the opportunity to submit the following comments on the re-exposure of APF 2020-12. ACLI supports the Clearly Defined Hedging Strategy (CDHS) concept and efforts to create a single set of CDHS criteria that are applicable to all chapters of the Valuation Manual. We also appreciate the spirit of the APF to address regulatory concerns around perceived optionality in the application of the CDHS concept. That said, we do not believe the APF appropriately addresses this concern, nor do we believe that the APF as currently drafted would eliminate the concern. We offer an alternative solution and outline concerns we have with the APF.

Our Suggested Alternative Path

ACLI believes work should continue to address the regulator concerns articulated in this APF. Our suggested alternative is based on a company opt-in to CDHS status and regulatory oversight/approval of changes to CDHS status to prevent toggling between CDHS and non-CDHS status. Our proposed approach is conceptually similar to the current approach for the reflection of smoothing of the C-3 charge for variable annuities.

- There would be an initial one-time initial regulatory approval for the reflection of all relevant hedging strategies and classification as either CDHS or not CDHS. Deciding whether to have a CDHS would be a company option. However, the CDHS criteria would also need to be met for CDHS treatment to apply. It would be permissible to have a strategy that satisfies the CDHS criteria but is not reflected as a CDHS.
- No ongoing regulatory approval would be needed unless: (1) there is a CDHS and the CDHS criteria are no longer met, (2) there is a CDHS and the company no longer wishes to model the strategy as a CDHS, or (3) a company wishes to change from non-CDHS treatment to CDHS treatment.
- If a change in CDHS status is either desired or warranted, regulatory involvement would be required, as follows:
  o If a strategy is a CDHS and either (a) CDHS criteria are no longer met or (b) the company no longer wishes to model the strategy as a CDHS, the company must notify the regulator in advance of reporting. The regulator has the option to require CDHS treatment.
If a strategy has not been a CDHS and the company wishes to model the strategy as a CDHS, the company must secure pre-approval from the regulator, demonstrating that the CDHS criteria are met.

The advantages of this approach are:

- It increases regulatory oversight and includes the explicit ability for regulators to constrain perceived abuse.
- It retains the fundamental decisions about hedging made during the VA reform project that have led to the reduced use of captive reinsurance.
- It avoids the incentive to deliberately “fail” CDHS status by making CDHS status an explicit choice (with the additional wrinkle that CDHS criteria must also be met for CDHS treatment to apply).
- It avoids the perverse incentive for a company to find ways (such as making a hedging strategy less “clearly defined”) if the company wishes to avoid CDHS status.
- It avoids creating unintended incentives for companies to reduce or remove certain hedging programs.
- It avoids the considerable challenges of defining boundaries for the SHS concept.

If there is interest from LATF in this concept, we would be pleased to work with regulators on an APF.

To further elaborate on why we believe this alternative is preferable to the current APF, we offer the following concerns.

**General Concerns**

1) **The APF appears to be based on a presumption that certain non-CDHS strategies are illegitimate**

The APF would create a strong deterrent for companies to employ a Seasoned Hedging Strategy (SHS) that is not a CDHS. It proposes to penalize such strategies by imposing three burdens:

- A requirement to model SHS strategies as a CDHS even if they are not classified as a CDHS;
- A requirement to report the worst of two runs, one of which treats such strategies as a CDHS and the other of which does not treat them as a CDHS; and
- A prohibition of SSAP 108 CDHS accounting treatment even if the reported reserve is based on treating them as a CDHS.

As explained later, the proposed definition of SHS has ambiguities which may create confusion or render it ineffective for addressing the stated regulatory concern. Nevertheless, the APF suggests that certain non-CDHS strategies are inappropriate. They are either CDHSs in disguise (and therefore should modeled like CDHSs), or they should not be employed at all.
The APF does not consider the possibility that a variety of reasons may exist for companies to employ non-CDHS hedging strategies. For example, complex CDHS hedge modeling may not be achievable within reporting timeframes. Companies may have also concluded that, on balance, desired financial outcomes can be better managed under programs that do not qualify as CDHS strategies.

We believe that regulators typically do not intend to create barriers for effective risk management. In ACLI’s prior comment letter on this APF, we recommended a regulator survey so that regulators could obtain information on the various reasons why companies may employ non-CDHS hedging strategies and arrive at an informed conclusion of whether the APF would impose unintended regulatory barriers. If the APF continues to be pursued, we continue to encourage such a survey.

2) **The APF materially revises the treatment of hedging within the recently adopted VM-20 and VM-21 frameworks, reversing LATF decisions made during their development**

During the development of VM-20 and during the VM-21/C3P2 VA reform project, LATF made determinations about the regulatory treatment of various types of hedging programs. The APF effectively reverses some of these decisions, as shown by the highlighted portions of the following charts:

<table>
<thead>
<tr>
<th>Current PBR Reflection of Costs and Benefits of Current and Future Hedging</th>
</tr>
</thead>
<tbody>
<tr>
<td>VM-20 (Life)</td>
</tr>
<tr>
<td>Current hedges</td>
</tr>
<tr>
<td>Include in rebalancing</td>
</tr>
<tr>
<td>Include in rebalancing</td>
</tr>
<tr>
<td>Run off</td>
</tr>
<tr>
<td>Run off</td>
</tr>
</tbody>
</table>

\(^1\) The VM-21 CDHS hedging construct requires a weighted average of “Best Efforts” and “Adjusted” runs, based on assumed hedge effectiveness. The “Best Efforts” run would be consistent with the “CDHS” treatment, while the “Adjusted” run would be consistent with the “No CDHS” treatment.

\(^2\) VM-20 Section 7.K.1 and the associated guidance note appear to differentiate between non-CDHS derivative strategies and derivative programs that are undertaken “as part of the investment strategy supporting the policies.” The guidance note suggests that future transactions of non-CDHS derivative strategies would not be reflected, while future transactions associated with derivative programs that are part of the investment strategy would be reflected, provided that such programs “are normally modeled as part of the company’s risk assessment and evaluation processes.”

</tbody>
</table>

The changes would appear to target following types of hedging programs:

- **Indexed product hedging.** The APF would eliminate the VM-20’s current accommodation of indexed product hedging. LATF has historically considered indexed product hedging as being distinct from the CDHS concept but has viewed the modeling of future hedging transactions as essential. Accordingly, Section 7.K.1 includes language that requires the modeling of future transactions of certain non-CDHS programs. The APF would reverse LATF’s prior decision, eliminate this accommodation, and effectively require indexed product hedging to comply with the requirements imposed by the CDHS criteria. CDHS requirements will add significant amounts of effort to the reporting process with little benefit and potentially lead to non-economic reserves from the adjusted run under VM-21.

- **Various non-CDHS hedging programs.** The impact of the APF on non-CDHS hedging strategies—primarily relevant to VAs—is unclear due to ambiguities within the language. We suspect that the APF, however, may end up targeting—perhaps unintentionally—a variety of non-CDHS strategies that are used for risk management, representing a significant policy reversal. The Valuation Manual currently views non-CDHS hedging strategies that support the relevant contracts as fundamentally legitimate. VM-21, for example, allows a company either to run off or cash out of existing hedge positions. It accommodates the reality that a hedging strategy used now, and even historically, may not be the strategy used in the future, especially over very long periods of time, as economic and other circumstances change. Many companies have spent considerable resources collapsing captive reinsurers and retooling their hedging programs to be effective and efficient within the new VA framework. The APF, however, would reverse the current VM-21 approach, viewing certain strategies as illegitimate and imposing the trio of burdens described above.

In addition, the APF would reverse the current VM-20 approach for non-hedging derivative programs that are normally modeled. The current guidance note in VM-20 suggests that future transactions would be reflected for these programs. However, the APF would exclude future transactions because these derivative programs are non-hedging programs (i.e., neither a CDHS nor a SHS).

---

3 VM-20, Section 7.K.1 requires the inclusion of “appropriate costs and benefits of anticipated future derivative instrument transactions associated with non-hedging derivative programs (e.g., replication, income generation) undertaken as part of the investment strategy supporting the policies, provided they are normally modeled as part of the company’s risk assessment and evaluation processes.”
We suggest that it is premature to conclude that fundamental changes to the Valuation Manual treatment of hedging are warranted. Most carriers have just started to report year-end results under the new VM-20 and VM-21 frameworks. While we appreciate the desire to create a single PBR hedging framework, current differences exist for legitimate reasons. (That said, we do believe that some targeted changes may be merited to better accommodate indexed product hedging.)

The potential downstream impacts of making fundamental changes should not be underestimated. The forcing of indexed hedging into the CDHS realm will inevitably impose operational burdens on the industry and may create future complications with SSAP 108, for example. For VA books, the APF may promote another round of resource-intensive retooling of hedging strategies and could even encourage weakened policyholder protection.

3) The APF seems unlikely to address the stated concern

The APF seems unlikely to address the stated regulatory concern of “unintended optionality.” As shown by the above charts, the APF would make it more advantageous for companies to have a strategy that is neither an SHS nor a CDHS than to have a strategy that is an SHS but is not a CDHS. An incentive would always exist to conclude that a particular strategy is not an SHS, since nothing in the APF requires a CDHS to be an SHS.

The current drafting, in fact, makes it relatively easy to do avoid SHS status, if that is desired.

a. The definition of SHS includes the phrase “and for which future hedging transactions are normally modeled as part of the company's risk assessment and evaluation process.” For indexed products, it is difficult to conceive of a framework under which future hedging would not be reflected in some manner. On the VA side, however, many company “risk assessment and evaluation processes” do not necessarily incorporate the explicit modeling of future hedging transactions:

- Economic capital and risk management – future hedging transactions may or may not be reflected; simplified approaches would typically be used
- GAAP/IFRS – modeling of future hedging transactions is not permitted
- Pricing – future hedging transactions may or may not be reflected; simplified approaches would typically be used
- ICS – reflection of future hedging transactions is not permitted

The variety of “risk assessment and evaluation processes” within most organizations and the variety of modeling approaches used within such frameworks would often make it possible to make a case for different conclusions as to whether a particular program meets this part of the SHS definition.

b. The APF further indicates that “An SHS must meet all of the principles outlined in VM-21 Section 1.B (the most relevant of which may be Principle 5).” In other words, an SHS must affirmatively satisfy all five principles. Most of the Section 1.B principles, however, can be viewed as not applicable to most strategies (and therefore not affirmatively satisfied) because:
They are not necessarily consistent with how companies price products, report earnings, or manage risk through hedging. For instance, Principle 2 references “the greatest present value of accumulated deficiency,” which is a concept exclusive to U.S. regulatory requirements. Only hedging strategies that are based on stochastic regulatory measurements of risk would appear to clearly satisfy this principle.

Principle 5, which is highlighted in the APF, says that:

The use of assumptions, methods, models, risk management strategies (e.g., hedging), derivative instruments, structured investments, or any other risk transfer arrangements (such as reinsurance) that serve solely to reduce the calculated stochastic reserve without also reducing risk on scenarios similar to those used in the actual cash-flow modeling are inconsistent with these principles. The use of assumptions and risk management strategies should be appropriate to the business and not merely constructed to exploit ‘foreknowledge’ of the components of the required methodology.

This principle was intended to address hedging strategies designed to target a specific individual scenario (e.g., only the “pop-up” scenario of 300 bps but not a pop-up of 299 bps or 301 bps). Principle 5 does not clearly address the issue of deliberately failing CDHS criteria.

In general, the APF would move the pressure point from the CDHS criteria to the definition of SHS. While it would be possible to refine the definition of SHS, the incentives and disincentives created by the APF would tend to lead to ongoing definitional challenges around what is and is not an SHS. We suggest that regulators and industry may be better served by approaches that would avoid such challenges.

Other Areas of Potential Confusion

Beyond the above fundamental concerns, we believe the language of the proposal may create additional areas of confusion:

1. **Conflicting requirements:** The proposed edits to VM-20 seem to create conflicting requirements. VM-20 Section 7.K.4 states “If a SHS supporting the policies is not a CDHS but modeling it would result in an increase to the company’s minimum reserve, then the company shall model the SHS as if it were a CDHS when calculating reserves under VM-20.” However, this language appears to create a conflict with the Stochastic Exclusion Ratio Test (SERT) which leaves open the possibility for a group of policies with an SHS to pass the exclusion test, per VM-20 Section 6.A.1.b:

   A company may not exclude a group of policies for which there is one or more clearly defined hedging strategies from stochastic reserve requirements, except in the case where all clearly defined hedging strategies are solely associated with product features that are determined to not be material under VM-20 Section 7.B.1 due to low utilization.
The Section 6 text appears to allow a group of policies with an SHS to pass the exclusion test, however the Section 7 text requires the SHS be modeled if it raises reserves. The relationship of these provisions is not clear.

2. “Required to be modeled”: The draft of VM-21 Section 4.A.4 uses the phrase “SHS that is required to be modeled”. However, the proposed language under VM-20 (Section 7.K.4) and VM-21 (Section 9.A.6) indicates that the modeling “requirement” is not necessarily for the purpose of determining the actual reserves/TAR, but for the purpose of testing whether the hedging strategy is to be reflected within the reserves. The test involves two different reserve calculations: (1) future hedging transactions are not modeled, and (2) future hedging transactions are modeled. If the first calculation produces a greater reserve, then the SHS is effectively required to be not modeled, not required to be modeled. As such, the VM-21 Section 4.A.4 language is likely to create confusion.

3. Appropriateness of scope: The APF indicates that an SHS “may be dynamic, static, or a combination thereof.” Since a static hedging program is not rebalanced, it is not necessarily clear why static programs are part of the definition, although static hedges will eventually expire or mature.

4. Frequency of updates: The APF does not clarify how frequently a company should determine if the SHS increases reserves; it is unclear if this is a point in time calculation or must be it redetermined on an ongoing basis. Regardless of the potential frequency, the ability of the requirement to apply and not apply depending on economic conditions inherently introduces non-economic volatility, which was something the revised VM-21 framework attempted to avoid.

5. Deleted VM-20 text: The APF appears to change the requirements for VM-20 business. VM-20 Section 7.L.2 provided for an additional requirement beyond the CDHS definition: “Hedging strategies involving the offsetting of the risks associated with other products outside of the scope of these requirements is not a clearly defined hedging strategy.” While we do not necessarily oppose the deletion, we want to make sure the implications of this change are appropriately understood and we are unsure of the reason why this provision was originally included within VM-20.

We appreciate the consideration of our comments and look forward to discussing on a future call. Thank you.

Sincerely,

cc: Reggie Mazyck, NAIC
Mike,

Thank you for the opportunity to comment on this exposure.

My concerns include matters of principle and matters of use of language. The matters of principle are as follows:

1. As indicated in a Guidance Note in VM-20, the current CDHS provision is at variance with Principle 2. I presume that the reason for this is that while Principle 2 calls for “a projected total cash flow analysis by including all projected income, benefit and expense items...”, the CDHS provision only applies when the hedging strategy meets the CDHS criteria.

   It seems to me, therefore, that including a SHS that is only modeled if it would cause an increase in the reserve would also violate Principle 2. Consequently, its introduction would create two violations of Principle 2 rather than one.

2. The definition of SHS includes the statement “A SHS may or may not be a CDHS”. I have two comments:
   (a) The statement is unclear as to whether a CDHS is always an SHS. It is my understanding that this is the intent.
   (b) If it is the case that a CDHS is always an SHS, then, per VM-21 Section 9.A.5, since a new or revised CDHS only needs to be in existence for three months, the same needs to be true for an SHS.

3. The phrase “normally modeled” is somewhat open to interpretation. For example, does modeling the hedging strategy for purposes of the ORSA meet the criterion, or should it be more frequent?

4. The definitions of both CDHS and SHS include the sentence “A CDHS must meet all of the principles outlined in VM-21 Section 1.B (the most relevant of which may be Principle 5).” I think that a definition should be explicit as to the applicable criteria, and not leave it to the reader to determine what is intended. In particular, I find nothing in Principles 1-4 that can be used as a criterion for a hedging strategy. I will address this in my comments on the text below.

As to use of language and other comments, I have inserted 20 comments in the proposed text.

Thank you.

Amendment Proposal Form*

1. Identify yourself, your affiliation and a very brief description (title) of the issue.

**Identification:**
Rachel Hemphill and Karen Jiang, Texas Department of Insurance

**Title of the Issue:**
Create consistency between CDHS determination in VM-20 and VM-21. Revise hedge modeling to only require CDHS if modeling future hedging reduces the reserves under VM-20 or TAR under VM-21.

2. Identify the document, including the date if the document is “released for comment,” and the location in the document where the amendment is proposed:

January 1, 2021 NAIC Valuation Manual

3. Show what changes are needed by providing a red-line version of the original verbiage with deletions and identify the verbiage to be deleted, inserted or changed by providing a red-line (turn on “track changes” in Word®) version of the verbiage. (You may do this through an attachment.)

See attached.

4. State the reason for the proposed amendment? (You may do this through an attachment.)
Summary of 4/2/2021 Updates:

1. Revisions were made to VM-20 Section 7.K.4 (add “supporting the policies”) and VM-21 Section 9.A.6 (add “supporting the contracts”) in response to Nationwide’s comments.
2. We added a definition for “hedging transactions,” taken from the APPM but modified slightly to be consistent with Valuation Manual terminology in response to Will Wilton’s comments.
3. We have updated the list of CDHS criteria in response to Will Wilton’s comments where we agreed:
   a. Added “significant” before risks in item (c) of the CDHS definition.
   b. Combined items (f) – (h) in the CDHS definition.
   c. Change “person or persons” to “group or area, including whether internal or external,” in item (j) of the CDHS definition.
   d. We did not remove items (k) or (l) as suggested by Will Wilton, as we find this information useful to regulators. Given that these are retained, and because we were uncertain what else would be included in the new “primary risks” item suggested by Will Wilton, we have not added it. If we can be provided additional information on the risks to be reflected under this new item, an edit could be made.
4. We modified the definition of a SHS to clarify “normally modelled” in response to the ACLI comment and clarify what may be a SHS in response to Will Wilton’s comment (e.g., a single bond would not be a SHS).

We have added comment bubbles in the draft below to flag where we have made edits or chosen not to make edits and why.

---

We propose having consistent requirements for a CDHS in VM-20 and VM-21, as well as any future work on VM-22, and consolidating these requirements in the VM-01 definition of a CDHS. This involves adding two criteria to VM-21’s definition of CDHS that currently exist for VM-20:

- Areas where basis, gap or assumption risk related to the hedging strategy have been identified.
- The circumstances under which hedging strategy will not be effective in hedging the risks.

These criteria are both reasonable and apply in principle to VM-21, and to any future work on VM-22, as well as VM-20.
Further, we propose revising the requirement for hedging to be a CDHS in order for future hedging to be modeled under VM-20, VM-21, and LR027’s C-3 RBC Amount calculation to only apply when modeling such hedging reduces the life reserve level or variable annuity Total Asset Requirement (TAR) level.

The current regulatory requirements for hedging to be a CDHS in order for future hedging to be modeled under VM-20, modeled under VM-21, modeled for the C-3 RBC Amount calculation for variable annuities, and to be eligible for SSAP 108 treatment are all logical requirements when one considers whether hedging should be allowed to reduce the life reserve level or variable annuity TAR level, or whether any mismatch between movements in hedge assets and movements in the corresponding reserve levels should be allowed to be amortized over time.

However, this same requirement has led to a situation of there being unintended optionality in whether a hedging strategy that is like a CDHS is modeled or is not modeled, since a company may choose to satisfy or not satisfy certain of the criteria. This has been especially relevant for cases where modeling a company's hedging strategy would increase reserves or variable annuity TAR.

As noted in the current guidance note in VM-20 Section 7.K.1 in the 2021 Valuation Manual:

“The prohibition in these modeled reserve requirements against projecting future hedging transactions other than those associated with a clearly defined hedging strategy is intended to address initial concerns expressed by various parties that reserves could be unduly reduced by reflection of programs whose future execution and performance may have greater uncertainty. The prohibition appears, however, to be in conflict with Principle 2 listed in VM-21. Companies may actually execute and reflect in their risk assessment and evaluation processes hedging strategies similar in many ways to clearly defined hedging strategies but lack sufficient clarity in one or more of the qualification criteria. By excluding the associated derivative instruments, the investment strategy that is modeled may also not reflect the investment strategy the company actually uses. Further, because the future hedging transactions may be a net cost to the company in some scenarios and a net benefit in other scenarios, the exclusion of such transactions can result in a modeled reserve that is either lower or higher than it would have been if the transactions were not excluded. The direction of such impact on the reserves could also change from period to period as the actual and projected paths of economic conditions change. A more graded approach to recognition of non-qualifying hedging strategies may be more theoretically consistent with Principle 2. It is recommended that as greater experience is gained by actuaries and state insurance regulators with the principle-based approach and as industry hedging programs mature, the various requirements of this section be reviewed.”
We propose to continue addressing the regulatory concern that reserves could be unduly reduced by reflection of programs whose future execution and performance may have greater uncertainty, by continuing to only allowing hedging strategies that qualify as a CDHS to reduce life reserves and variable annuity TAR. However, we propose that the treatment of CDHS be made more principles-based and less subject to manipulation. To accomplish this, the proposal requires that any hedging strategy that is a part of the investment strategy supporting the policies and is normally modeled as part of the company's risk assessment and evaluation processes be modeled as if it were a CDHS if doing so results in an increase in life reserves or variable annuity TAR.

That is, CDHS becomes a requirement solely for hedging strategies that reduce life reserves or variable annuity TAR, and so becomes a more clear regulatory guardrail requiring that hedging strategies that reduce life reserves or variable annuity TAR must be clearly defined.

We continue to need the concept of a CDHS. A CDHS simply formally documents items that a company should be able to document for a robust, well-defined hedging strategy. It requires that the following be identified:

a. The specific risks being hedged (e.g., cash flow, policy interest credits, delta, rho, vega, etc.).
b. The hedge objectives.
c. The risks that are not hedged (e.g., variation from expected mortality, withdrawal, and other utilization or decrement rates assumed in the hedging strategy, etc.).
d. The financial instruments used to hedge the risks.
e. The hedge trading rules, including the permitted tolerances from hedging objectives.
f. The metrics for measuring hedging effectiveness.
g. The criteria used to measure hedging effectiveness.
h. The frequency of measuring hedging effectiveness.
i. The conditions under which hedging will not take place.
j. The person or persons responsible for implementing the hedging strategy.
k. Areas where basis, gap or assumption risk related to the hedging strategy have been identified.
l. The circumstances under which hedging strategy will not be effective in hedging the risks.

While the last two criteria have historically applied for life but not variable annuities, these are all reasonable documentation items that for a robust, well-defined hedging strategy regardless of whether the product is life or variable annuity.

The concept of a CDHS is used for accounting in SSAP 108. SSAP 108 allows companies to set up a deferred asset or liability to amortize the mismatch between changes in the value of the liability and changes in the value of the hedging instruments attributable to the hedged risk underlying a highly effective CDHS modeled for VM-21. Allowing this treatment encourages companies to reduce risk through robust, well-defined and highly effective hedging. Without having the hedging strategy be well-defined, regulators could not rely on past effectiveness being indicative of future effectiveness, and so could not offer companies the benefit of SSAP 108 treatment.
Once we recognize the need for a concept of a well-defined hedging strategy, the only question is what criteria would need to be met to be considered well-defined – that is, what criteria should be required to be considered a CDHS. This is a distinct question from whether the concept of a CDHS is needed. We have not heard critiques of individual criteria in the CDHS definition, but consideration of the criteria is appropriate as we go forward to make the definitions in VM-20 and VM-21 consistent. Similarly, in reserve and capital calculations, we rely on the concept of historical effectiveness to determine an error factor. If modeling hedging reduces the reserve or capital amount, the error factor determines the magnitude to which this is reflected. However, this use of the historical effectiveness relies on the hedging strategy being well-documented and comparable between historical hedging and planned future hedging. So, again, a need for hedging strategies to be well-defined presents itself – a CDHS concept is needed.

Finally, edits to VM-31 are needed to reflect these updates and bring VM-20 and VM-21 reporting requirements more in line with one another where appropriate.

Note on Coordination with RBC and APPM: We have reviewed, and with these edits there are no corresponding edits necessary for LR027 for RBC but corresponding edits are necessary for SSAP 108. A referral to SAPWG is to be concurrently considered with this APF.

**VM-01**

- The term “clearly defined hedging strategy” (CDHS) means a strategy undertaken by a company to manage risks through the future purchase or sale of hedging instruments and the opening and closing of hedging positions that meet the criteria specified in the applicable reserve requirement section of the Valuation Manual. A CDHS must identify:
  
  a. The specific risks being hedged (e.g., cash flow, policy interest credits, delta, rho, vega, etc.).
  b. The hedging objectives.
  c. The significant risks that are not hedged (e.g., variation from expected mortality, withdrawal, and other utilization or decrement rates assumed in the hedging strategy, etc.).
  d. The financial instruments used to hedge the risks.
  e. The hedging strategy’s trading rules, including the permitted tolerances from hedging objectives.
  f. The metrics, criteria, and frequency for measuring hedging effectiveness.
  g. The conditions under which hedging will not take place.
  h. The group or area, including whether internal or external, responsible for implementing the hedging strategy.
  i. Areas where basis, gap or assumption risk related to the hedging strategy have been identified.
  j. The circumstances under which hedging strategy will not be effective in hedging the risks.

**Commented [RJW1]:** “hedging objective” rather than “hedge objective”

**Commented [RH2]:** Added “significant” in response to Will Wilton’s comment. Retained item because information provided on this item by companies is helpful for regulators.

**Commented [RJW3]:** “hedging strategy”’s instead of “hedge”

**Commented [RH4]:** Edited for Will Wilton comment – combined three bullets into one.

**Commented [RH5]:** Edited for Will Wilton comment – replaced “person or persons” with “group or area, including whether internal or external,”.

**Commented [RH6]:** Three notes on Will Wilton suggestion to remove and why we chose to retain:

1. Definition needs to work for both VM-20 and VM-21, so can’t be removed based on a VM-21 requirement only.

2. VM-21 Section 9.B.4 requires that your modeling reflect this – while this item requires that your hedge documentation identifies them. That is different. This has to come before 9.B.4. You have to identify before you can reflect.

3. This also only used to exist for VM-21, and companies have suggested adding to VM-20.

**Commented [RH7]:** Did not remove as suggested by Will Wilton comment. We find the information provided by companies in response to this item helpful. This also only used to exist for VM-21, and companies have suggested adding to VM-20.
The hedging strategy must not serve solely to reduce the calculated stochastic reserve without also reducing risk (VM-21, Section 1.B, Principle 5).

The hedging strategy may be dynamic, static or a combination thereof. A strategy involving the offsetting of the risks associated with products falling under the scope of different requirements within the Valuation Manual (e.g., VM-20, VM-21, or VM-22) does not qualify as CDHS. A CDHS must meet all of the principles outlined in VM-21 Section 1.B (the most relevant of which may be Principle 5).

Guidance Note: For purposes of the above criteria, “effectiveness” need not be measured in a manner as defined in SSAP No. 86—Derivatives in the AP&P Manual.

- The term “hedging transaction” means a derivative(s) transaction which is entered into and maintained to reduce:
  a. The risk of a change in the fair value or cash flow of assets and liabilities which the company has acquired or incurred or has a firm commitment to acquire or incur or for which the company has a forecasted acquisition or incurrence; or
  b. The currency exchange rate risk or the degree of foreign currency exposure in assets and liabilities which the company has acquired or incurred or has a firm commitment to acquire or incur or for which the company has forecasted acquisition or incurrence.

- The term “Seasoned Hedging Strategy” (SHS) means a hedging strategy that is part of the company’s investment strategy and for which future hedging transactions are normally modeled as part of the company’s risk assessment and evaluation process. A SHS may or may not be a CDHS.

The hedging strategy may be dynamic, static, or a combination thereof. A strategy involving the offsetting of the risks associated with products falling under the scope of different requirements within the Valuation Manual (e.g., VM-20, VM-21, or VM-22) does not qualify as SHS. A SHS must meet all of the principles outlined in VM-21 Section 1.B (the most relevant of which may be Principle 5).

Commented [RJW(8)]: New criterion based on Principle 5.
Commented [RJW(9)]: “hedging strategy” instead of “hedge strategy”.
Commented [RJW(10)]: Delete, and replace with criterion k above.

Commented [RH11]: Added in response to Will Wilton comment about what is a SHS.

Commented [RH12]: Added “for which future hedging transactions” to address ACLI comment on ambiguity around “normally modeled”.

Also clarifies per Will Wilton comment, when combined with APPM definition of hedging transactions, since hedging transactions are derivatives transactions.

Commented [RJW(13)]: “hedging strategy” instead of “hedge strategy”.

Commented [RJW(14)]: Delete; however, since SHS is intended to be modeled only when it increases the stochastic reserve, Principle 5 cannot be used as a criterion in the same way as CDHS.
VM-20 Section 6.A.1.b

A company may not exclude a group of policies for which there is one or more clearly defined hedging strategies (CDHS) or one or more SHS required to be modeled pursuant to Section 7.K.4 from stochastic reserve requirements, except in the case where all clearly defined hedging strategies (CDHS) and all SHS required to be modeled pursuant to Section 7.K.4 are solely associated with product features that are determined to not be material under Section 7.B.1 due to low utilization.

VM-20 Section 7.E.1.g

Notwithstanding the above requirements, the modeled reserve shall be the higher of that produced by the model investment strategy and that produced by substituting an alternative investment strategy in which the fixed income reinvestment assets have the same weighted average life (WAL) as the reinvestment assets in the model investment strategy and are all public non-callable corporate bonds with gross asset spreads, asset default costs and investment expenses by projection year that are consistent with a credit quality blend of 50% PBR credit rating 6 (A2/A) and 50% PBR credit rating 3 (Aa2/AA).

Policy loans, equities and derivative instruments associated with the execution of a clearly defined hedging strategy (CDHS) or a SHS that is required to be modeled pursuant to Section 7.K.4 are not affected by this requirement.

VM-20 Section 7.K

K. Modeling of Derivative Programs

1. When determining the deterministic reserve and the stochastic reserve, the company shall include in the projections the appropriate costs and benefits of derivative instruments that are currently held by the company in support of the policies subject to these requirements. The company shall also include the appropriate costs and benefits of anticipated future derivative instrument transactions associated with the execution of a clearly defined hedging strategy (CDHS) or a SHS that is required to be modeled pursuant to Section 7.K.4, as well as the appropriate costs and benefits of anticipated future derivative instrument transactions associated with non-hedging derivative programs (e.g., replication, income generation) undertaken as part of the investment strategy supporting the policies, provided they are normally modeled as part of the company’s risk assessment and evaluation processes.

Guidance Note: The requirements stated here for handling hedging strategies are essentially consistent with those included in the CTE methodology of VM-21 and the five principles spelled out there. The prohibition in these modeled reserve requirements against projecting future hedging transactions other than those associated with a clearly defined hedging strategy is intended to address initial concerns expressed...
by various parties that reserves could be unduly reduced by reflection of programs whose future execution and performance may have greater uncertainty. The prohibition appears, however, to be in conflict with Principle 2 listed in VM-21. Companies may actually execute and reflect in their risk assessment and evaluation processes hedging strategies similar in many ways to clearly defined hedging strategies but lack sufficient clarity in one or more of the qualification criteria. By excluding the associated derivative instruments, the investment strategy that is modeled may also not reflect the investment strategy the company actually uses. Further, because the future hedging transactions may be a net cost to the company in some scenarios and a net benefit in other scenarios, the exclusion of such transactions can result in a modeled reserve that is either lower or higher than it would have been if the transactions were not excluded. The direction of such impact on the reserves could also change from period to period as the actual and projected paths of economic conditions change. A more graded approach to recognition of non-qualifying hedging strategies may be more theoretically consistent with Principle 2. It is recommended that as greater experience is gained by actuaries and state insurance regulators with the principle-based approach and as industry hedging programs mature, the various requirements of this section be reviewed.

2. For each derivative program that is modeled, the company shall reflect the company’s established investment policy and procedures for that program; project expected program performance along each scenario; and recognize all benefits, residual risks and associated frictional costs. The residual risks include, but are not limited to: basis, gap, price, parameter estimation and variation in assumptions (mortality, persistency, withdrawal, etc.). Frictional costs include, but are not limited to: transaction, margin (opportunity costs associated with margin requirements) and administration. For clearly defined hedging strategies CDHS or SHS required to be modeled pursuant to Section 7.K.4, the company may not assume that residual risks and frictional costs have a value of zero, unless the company demonstrates in the PBR Actuarial Report that “zero” is an appropriate expectation.

3. In circumstances where one or more material risk factors related to a derivative program are not fully captured within the cash-flow model used to calculate CTE 70, the company shall reflect such risk factors by increasing the stochastic reserve as described in Section 5.E.

4. If a SHS supporting the policies is not a CDHS but modeling it would result in an increase to the company’s minimum reserve, then the company shall model the SHS as if it were a CDHS when calculating reserves under VM-20.

VM-20 Section 7.L (Remove entire Section 7.L)

A Clearly Defined Hedging Strategy

A clearly defined hedging strategy must identify:

- The specific risks being hedged (e.g., cash flow, policy interest credits, delta, rho, vega, etc.).
- The hedge objectives.
- The risks that are not hedged (e.g., variation from expected mortality, withdrawal, and other utilization or decrement rates assumed in the hedging strategy, etc.).
- The financial instruments used to hedge the risks.
- The hedge trading rules, including the permitted tolerances from hedging objectives.
f. The metrics for measuring hedging effectiveness.
g. The criteria used to measure hedging effectiveness.
h. The frequency of measuring hedging effectiveness.
i. The conditions under which hedging will not take place.
j. The person or persons responsible for implementing the hedging strategy.
k. Areas where basis, gap or assumption risk related to the hedging strategy have been identified.
l. The circumstances under which hedging strategy will not be effective in hedging the risks.

Hedging strategies involving the offsetting of the risks associated with other products outside of the scope of these requirements is not a clearly defined hedging strategy.

**Guidance Note:** For purposes of the above criteria, “effectiveness” need not be measured in a manner as defined in SSAP No. 86 – Derivatives in the AP&P Manual.
The term “clearly defined hedging strategy” (CDHS) is defined in VM-01. In order to be designated as a CDHS, the strategy must meet the principles outlined in Section 1.B (particularly Principle 5) and shall, at a minimum, identify:

a. The specific risks being hedged (e.g., delta, rho, vega, etc.).
b. The hedge objectives.
c. The risks not being hedged (e.g., variation from expected mortality, withdrawal, and other utilization or decrement rates assumed in the hedging strategy, etc.).
d. The financial instruments that will be used to hedge the risks.
e. The hedge trading rules, including the permitted tolerances from hedging objectives.
f. The criteria that will be used to measure hedging effectiveness.
g. The metric(s) for measuring hedging effectiveness.
h. The frequency of measuring hedging effectiveness.
i. The conditions under which hedging will not take place.
j. The person or persons responsible for implementing the hedging strategy.

Guidance Note: It is important to note that strategies involving the offsetting of the risks associated with VA guarantees with other products outside of the scope of these requirements (e.g., equity-indexed annuities) do not currently qualify as a clearly defined hedging strategy under these requirements.

VM-21 Section 4.A.4

Modeling of Hedges

a. For a company that does not have a CDHS or a SHS that is required to be modeled pursuant to Section 9.A.6:

i. The company shall not consider the cash flows from any future hedge purchases or any rebalancing of existing hedge assets in its modeling.

ii. Existing hedging instruments that are currently held by the company in support of the contracts falling under the scope of these requirements shall be included in the starting assets. The hedge assets may then be considered in one of two ways:

a) Include the asset cash flows from any contractual payments and maturity values in the projection model; or
b) No hedge positions – in which case the hedge positions held on the valuation date are replaced with cash and/or other general account assets in an amount equal to the aggregate market value of these hedge positions.

**Guidance Note:** If the hedge positions held on the valuation date are replaced with cash, then as with any other cash, such amounts may then be invested following the company’s investment strategy.

A company may switch from method a) to method b) at any time, but it may only change from b) to a) with the approval of the domiciliary commissioner.

b. **For a company with a CDHS or a SHS that is required to be modeled pursuant to Section 9.A.6,** the detailed requirements for the modeling of hedges are defined in Section 9. The following paragraphs are a high-level summary and do not supersede the detailed requirements.

i. The appropriate costs and benefits of hedging instruments that are currently held by the company in support of the contracts falling under the scope of these requirements shall be included in the projections used in the determination of the stochastic reserve.

ii. The projections shall take into account the appropriate costs and benefits of hedge positions expected to be held in the future through the execution of the CDHS or the SHS that is required to be modeled pursuant to Section 9.A.6. Because models do not always accurately portray the results of hedge programs, the company shall, through back-testing and other means, assess the accuracy of the hedge modeling. The company shall determine a stochastic reserve as the weighted average of two CTE values; first, a CTE70 (“best efforts”) representing the company’s projection of all of the hedge cash flows, including future hedge purchases, and a second CTE70 (“adjusted”) which shall use only hedge assets held by the company on the valuation date and no future hedge purchases. These are discussed in greater detail in Section 9. The stochastic reserve shall be the weighted average of the two CTE70 values, where the weights reflect the error factor (E) determined following the guidance of Section 9.C.4.

iii. The company is responsible for verifying compliance with CDHS requirements or SHS requirements if required to be modeled pursuant to Section 9.A.6, and any other requirements in Section 9 for all hedging instruments included in the projections.

iv. The use of products not falling under the scope of these requirements (e.g., equity-indexed annuities) as a hedge shall not be recognized in the determination of accumulated deficiencies.

**VM-21 Section 4.D.4.b**

Notwithstanding the above requirements, the model investment strategy and any non-prescribed asset spreads shall be adjusted as necessary so that the aggregate reserve is not less than that which would be obtained by substituting an alternative investment strategy in which all fixed income reinvestment assets are public non-callable corporate bonds with gross asset spreads, asset default costs, and investment expenses by projection year that are consistent with a credit quality blend of 50% PBR credit rating 6 (A2/A) and 50% PBR credit rating 3 (Aa2/AA).
Policy loans, equities and derivative instruments associated with the execution of a clearly defined hedging strategy (CDHS or a SHS that is required to be modeled pursuant to Section 9.A.6) are not affected by this requirement.

**VM-21 Section 6.B.3.a.ii – Footnote (Footnote at Bottom of Page 21-22)**

Throughout this Section 6, references to CTE70 (adjusted) shall also mean the Stochastic Reserve for a company that does not have a CDHS or a SHS that is required to be modeled pursuant to Section 9.A.6 as discussed in Section 4.A.4.a.

**VM-21 Section 6.B.3.b.ii**

Calculate the Prescribed Projections Amount as the CTE70 (adjusted) using the same method as that outlined in Section 9.C (which is the same as the stochastic reserves following Section 4.A.4.a for a company that does not have a CDHS or a SHS that is required to be modeled pursuant to Section 9.A.6) but substituting the assumptions prescribed by Section 6.C. The calculation of this Prescribed Projections Amount also requires that the scenario reserve for any given scenario be equal to or in excess of the cash surrender value in aggregate on the valuation date for the group of contracts modeled in the projection.

**VM-21 Section 6.B.5**

Cash flows associated with hedging shall be projected in the same manner as that used in the calculation of the CTE70 (adjusted) as discussed in Section 9.C or Section 4.A.4.a for a company without a CDHS or a SHS that is required to be modeled pursuant to Section 9.A.6.
VM-21 Section 9

Section 9: Modeling of Hedges under a CDHS

A. Initial Considerations

1. Subject to Section 9.C.2, the appropriate costs and benefits of hedging instruments that are currently held by the company in support of the contracts falling under the scope of these requirements shall be included in the calculation of the stochastic reserve, determined in accordance with Section 3.D and Section 4.D.

2. If the company is following a CDHS, in accordance with an investment policy adopted by the board of directors, or a committee of board members, the company shall take into account the costs and benefits of hedge positions expected to be held by the company in the future along each scenario based on the execution of the hedging strategy, and it is eligible to reduce the amount of the stochastic reserve using projections otherwise calculated. The investment policy must clearly articulate the company’s hedging objectives, including the metrics that drive rebalancing/trading. This specification could include maximum tolerable values for investment losses, earnings, volatility, exposure, etc. in either absolute or relative terms over one or more investment horizons vis-à-vis the chance of occurrence. Company management is responsible for developing, documenting, executing and evaluating the investment strategy, including the hedging strategy, used to implement the investment policy.

3. For this purpose, the investment assets refer to all the assets, including derivatives supporting covered products and guarantees. This also is referred to as the investment portfolio. The investment strategy is the set of all asset holdings at all points in time in all scenarios. The hedging portfolio, which also is referred to as the hedging assets, is a subset of the investment assets. The hedging strategy is the hedging asset holdings at all points in time in all scenarios. There is no attempt to distinguish what is the hedging portfolio and what is the investment portfolio in this section. Nor is the distinction between investment strategy and hedging strategy formally made here. Where necessary to give effect to the intent of this section, the requirements applicable to the hedging portfolio or the hedging strategy are to apply to the overall investment portfolio and investment strategy.

4. This particularly applies to restrictions on the reasonableness or acceptability of the models that make up the stochastic cash-flow model used to perform the projections, since these restrictions are inherently restrictions on the joint modeling of the hedging and non-hedging portfolio. To give effect to these requirements, they must apply to the overall investment strategy and investment portfolio.

5. Before either a new or revised hedging strategy can be used to reduce the amount of the stochastic reserve otherwise calculated, the hedging strategy should be in place (i.e., effectively implemented by the company) for at least three months. The company may meet the time requirement by having evaluated the effective implementation of the hedging strategy for at least three months without actually having executed the trades indicated by the hedging strategy (e.g., mock testing or by having effectively implemented the strategy with similar annuity products for at least three months).

6. If a SHS supporting the contracts is not a CDHS but modeling it as if it were a CDHS would result in an increase in the company’s TAR, then the company shall model the SHS as if it were a CDHS when calculating reserves under AG43 and/or VM-21 and when calculating the C-3 RBC Amount under LR027. The company shall not treat the SHS as a CDHS for purposes of SSAP 108.

Commented [RJW(20): Here, the company is required to follow a CDHS. The documentation requirements alone do not prove that the company is following its CDHS.

Commented [RH21]: Added “supporting the contracts” in response to Nationwide comments.
B. Modeling Approaches

1. The analysis of the impact of the hedging strategy on cash flows is typically performed using either one of two types of methods as described below. Although a hedging strategy normally would be expected to reduce risk provisions, the nature of the hedging strategy and the costs to implement the strategy may result in an increase in the amount of the stochastic reserve otherwise calculated.

2. The fundamental characteristic of the first type of method, referred to as the “explicit method,” is that hedging positions and their resulting cash flows are included in the stochastic cash-flow model used to determine the scenario reserve, as discussed in Section 3.D, for each scenario.

3. The fundamental characteristic of the second type of method, referred to as the “implicit method,” is that the effectiveness of the current hedging strategy on future cash flows is evaluated, in part or in whole, outside of the stochastic cash-flow model. There are multiple ways that this type of modeling can be implemented. In this case, the reduction to the stochastic reserve otherwise calculated should be commensurate with the degree of effectiveness of the hedging strategy in reducing accumulated deficiencies otherwise calculated.

4. Regardless of the methodology used by the company, the ultimate effect of the current hedging strategy (including currently held hedge positions) on the stochastic reserve needs to recognize all risks, associated costs, imperfections in the hedges and hedging mismatch tolerances associated with the hedging strategy. The risks include, but are not limited to: basis, gap, price, parameter estimation and variation in assumptions (mortality, persistency, withdrawal, annuitization, etc.). Costs include, but are not limited to: transaction, margin (opportunity costs associated with margin requirements) and administration. In addition, the reduction to the stochastic reserve attributable to the hedging strategy may need to be limited due to the uncertainty associated with the company’s ability to implement the hedging strategy in a timely and effective manner. The level of operational uncertainty varies indirectly with the amount of time that the new or revised strategy has been in effect or mock tested.

Guidance Note: No hedging strategy is perfect. A given hedging strategy may eliminate or reduce some but not all risks, transform some risks into others, introduce new risks, or have other imperfections. For example, a delta-only hedging strategy does not adequately hedge the risks measured by the “Greeks” other than delta. Another example is that financial indices underlying typical hedging instruments typically do not perform exactly like the separate account funds, and hence the use of hedging instruments has the potential for introducing basis risk.

5. A safe harbor approach is permitted for CDHS reflection for those companies whose modeled hedge assets comprise only linear instruments not sensitive to implied volatility. For companies with option-based hedge strategies, electing this approach would require representing the option-based portion of the strategy as a delta-rho two-Greek hedge program. The normally modeled option portfolio would be replaced with a set of linear instruments that have the same first-order Greeks as the original option portfolio.
C. Calculation of Stochastic Reserve (Reported)

1. The company shall calculate CTE70 (best efforts)—the results obtained when the CTE70 is based on incorporating the CDHS (including both currently held and future hedge positions) into the stochastic cash-flow model on a best efforts basis, including all of the factors and assumptions needed to execute the CDHS (e.g., stochastic implied volatility). The determination of CTE70 (best efforts) may utilize either explicit or implicit modeling techniques.

2. The company shall calculate a CTE70 (adjusted) by recalculating the CTE70 assuming the company has no CDHS, therefore following the requirements of Section 4.A.4.a.

3. Because most models will include at least some approximations or idealistic assumptions, CTE70 (best efforts) may overstate the impact of the hedging strategy. To compensate for potential overstatement of the impact of the hedging strategy, the value for the stochastic reserve is given by:

   \[
   \text{Stochastic reserve} = \text{CTE70 (best efforts)} + E \times \max[0, \text{CTE70 (adjusted)} - \text{CTE70 (best efforts)}]
   \]

4. The company shall specify a value for \(E\) (the “error factor”) in the range from 5% to 100% to reflect the company’s view of the potential error resulting from the level of sophistication of the stochastic cash-flow model and its ability to properly reflect the parameters of the hedging strategy (i.e., the Greeks being covered by the strategy), as well as the associated costs, risks and benefits. The greater the ability of the stochastic model to capture all risks and uncertainties, the lower the value of \(E\). The value of \(E\) may be as low as 5% only if the model used to determine the CTE70 (best efforts) effectively reflects all of the parameters used in the hedging strategy. If certain economic risks are not hedged, yet the model does not generate scenarios that sufficiently capture those risks, \(E\) must be in the higher end of the range, reflecting the greater likelihood of error. Likewise, simplistic hedge cash-flow models shall assume a higher likelihood of error.

5. The company shall conduct a formal back-test, based on an analysis of at least the most recent 12 months, to assess how well the model is able to replicate the hedging strategy in a way that supports the determination of the value used for \(E\).

6. Such a back-test shall involve one of the following analyses:
   a. For companies that model hedge cash flows directly (“explicit method”), replace the stochastic scenarios used in calculating the CTE70 (best efforts) with a single scenario that represents the market path that actually manifested over the selected back-testing period and compare the projected hedge asset gains and losses against the actual hedge asset gains and losses – both realized and unrealized – observed over the same time period. For this calculation, the model assumptions may be replaced with parameters that reflect actual experience during the back-testing period. In order to isolate the comparison between the modeled hedge strategy and actual hedge results for this calculation, the projected liabilities should accurately reflect the actual liabilities throughout the back-testing period; therefore, adjustments that facilitate this accuracy (e.g. reflecting actual experience instead of model assumptions, including new business, etc.) are permissible.

   To support the choice of a low value of \(E\), the company should ascertain that the projected hedge asset gains and losses are within close range of 100% (e.g., 80–125%) of the actual hedge asset
gains and losses. The company may also support the choice of a low value of \( E \) by achieving a high R-squared (e.g., 0.80 or higher) when using a regression analysis technique.

b. For companies that model hedge cash flows implicitly by quantifying the cost and benefit of hedging using the fair value of the hedged item (an "implicit method" or "cost of reinsurance method"), calculate the delta, rho and vega coverage ratios in each month over the selected back-testing period in the following manner:

i. Determine the hedge asset gains and losses—both realized and unrealized—incurred over the month attributable to equity, interest rate, and implied volatility movements.

ii. Determine the change in the fair value of the hedged item over the month attributable to equity, interest rate, and implied volatility movements. The hedged item should be defined in a manner that reflects the proportion of risks hedged (e.g., if a company elects to hedge 50% of a contract’s market risks, it should quantify the fair value of the hedged item as 50% of the fair value of the contract).

iii. Calculate the delta coverage ratio as the ratio between (i) and (ii) attributable to equity movements.

iv. Calculate the rho coverage ratio as the ratio between (i) and (ii) attributable to interest rate movements.

v. Calculate the vega coverage ratio as the ratio between (i) and (ii) attributable to implied volatility movements.

vi. To support the company’s choice of a low value of \( E \), the company should be able to demonstrate that the delta and rho coverage ratios are both within close range of 100 % (e.g., 80–125%) consistently across the back-testing period.

vii. In addition, the company should be able to demonstrate that the vega coverage ratio is within close range of 100 % in order to use the prevailing implied volatility levels as of the valuation date in quantifying the fair value of the hedged item for the purpose of calculating CTE70 (best efforts). Otherwise, the company shall quantify the fair value of the hedged item for the purpose of calculating CTE70 (best efforts) in a manner consistent with the realized volatility of the scenarios captured in the CTE (best efforts).

c. Companies that do not model hedge cash flows explicitly, but that also do not use the implicit method as outlined in Section 9.C.6.b above, shall conduct the formal back-test in a manner that allows the company to clearly illustrate the appropriateness of the selected method for reflecting the cost and benefit of hedging, as well as the value used for \( E \).

7. A company that does not have 12 months of experience to date shall set \( E \) to a value that reflects the amount of experience available, and the degree and nature of any change to the hedge program. For a material change in strategy, with no history, \( E \) should be at least 0.50. However, \( E \) may be lower than 0.50 if some reliable experience is available and/or if the change in strategy is a refinement rather than a substantial change in strategy.

**Guidance Note:** The following examples are provided as guidance for determining the \( E \) factor when there has been a change to the hedge program:
The error factor should be temporarily large (e.g., \( \geq 50\% \)) for substantial changes in hedge methodology (e.g., moving from a fair-value based strategy to a stop-loss strategy) where the company has not been able to provide a meaningful simulation of hedge performance based on the new strategy.

A temporary moderate increase (e.g., 15–30\%) in error factor should be used for substantial modifications to hedge programs or CDHS modeling where meaningful simulation has not been created (e.g., adding second-order hedging, such as gamma or rate convexity).

No increase in the error factor may be used for incremental modifications to the hedge strategy (e.g., adding death benefits to a program that previously covered only living benefits, or moving from swaps to Treasury Department futures).

D. Additional Considerations for CTE70 (best efforts)

If the company is following a CDHS, the fair value of the portfolio of contracts falling within the scope of these requirements shall be computed and compared to the CTE70 (best efforts) and CTE70 (adjusted). If the CTE70 (best efforts) is below both the fair value and CTE70 (adjusted), the company should be prepared to explain why that result is reasonable.

For the purposes of this analysis, the stochastic reserve and fair value calculations shall be done without requiring the scenario reserve for any given scenario to be equal to or in excess of the cash surrender value in aggregate for the group of contracts modeled in the projection.

E. Specific Considerations and Requirements

1. As part of the process of choosing a methodology and assumptions for estimating the future effectiveness of the current hedging strategy (including currently held hedge positions) for purposes of reducing the stochastic reserve, the company should review actual historical hedging effectiveness. The company shall evaluate the appropriateness of the assumptions on future trading, transaction costs, other elements of the model, the strategy, the mix of business and other items that are likely to result in materially adverse results. This includes an analysis of model assumptions that, when combined with the reliance on the hedging strategy, are likely to result in adverse results relative to those modeled. The parameters and assumptions shall be adjusted (based on testing contingent on the strategy used and other assumptions) to levels that fully reflect the risk based on historical ranges and foreseeable future ranges of the assumptions and parameters. If this is not possible by parameter adjustment, the model shall be modified to reflect them at either anticipated experience or adverse estimates of the parameters.

2. A discontinuous hedging strategy is a hedging strategy where the relationships between the sensitivities to equity markets and interest rates (commonly referred to as the Greeks) associated with the guaranteed contract holder options embedded in the variable annuities and other in-scope products and these same sensitivities associated with the hedging assets are subject to material discontinuities. This includes, but is not limited to, a hedging strategy where material hedging assets will be obtained when the variable annuity account balances reach a predetermined level in relationship to the guarantees. Any hedging strategy, including a delta hedging strategy, can be a discontinuous hedging strategy if implementation of the strategy permits material discontinuities between the sensitivities to equity markets and interest rates associated with the
guaranteed contract holder options embedded in the variable annuities and other in-scope products and these same sensitivities associated with the hedging assets. There may be scenarios that are particularly costly to discontinuous hedging strategies, especially where those result in large discontinuous changes in sensitivities (Greeks) associated with the hedging assets. Where discontinuous hedging strategies contribute materially to a reduction in the stochastic reserve, the company must evaluate the interaction of future trigger definitions and the discontinuous hedging strategy, in addition to the items mentioned in the previous paragraph. This includes an analysis of model assumptions that, when combined with the reliance on the discontinuous hedging strategy, may result in adverse results relative to those modeled.

3. A strategy that has a strong dependence on acquiring hedging assets at specific times that depend on specific values of an index or other market indicators may not be implemented as precisely as planned.

4. The combination of elements of the stochastic cash-flow model—including the initial actual market asset prices, prices for trading at future dates, transaction costs and other assumptions—should be analyzed by the company as to whether the stochastic cash-flow model permits hedging strategies that make money in some scenarios without losing a reasonable amount in some other scenarios. This includes, but is not limited to:
   a. Hedging strategies with no initial investment that never lose money in any scenario and in some scenarios make money.
   b. Hedging strategies that, with a given amount of initial money, never make less than accumulation at the one-period risk-free rates in any scenario but make more than this in one or more scenarios.

5. If the stochastic cash-flow model allows for such situations, the company should be satisfied that the results do not materially rely directly or indirectly on the use of such strategies. If the results do materially rely directly or indirectly on the use of such strategies, the strategies may not be used to reduce the stochastic reserve otherwise calculated.

6. In addition to the above, the method used to determine prices of financial instruments for trading in scenarios should be compared to actual initial market prices. In addition to comparisons to initial market prices, there should be testing of the pricing models that are used to determine subsequent prices when scenarios involve trading financial instruments. This testing should consider historical relationships. For example, if a method is used where recent volatility in the scenario is one of the determinants of prices for trading in that scenario, then that model should approximate actual historic prices in similar circumstances in history.

**VM-31 Section 3.C.5**

**Assets and Risk Management** – A brief description of the asset portfolio, and the approach used to model risk management strategies, such as hedging, and other derivative programs, including a description of any clearly defined hedging strategies. CDHS and any SHS that is required to be modeled pursuant to VM-20 Section 7.K.4.
VM-31 Section 3.D.6.f

Risk Management – Detailed description of model risk management strategies, such as hedging and other derivative programs, including any clearly defined hedging strategies, specific to the groups of policies covered in this sub-report and not discussed in the Life Summary Section 3.C.5. This should include documentation for any hedging strategy that meets the requirements to be a CDHS. It should also include, for any SHS that is required to be modeled pursuant to VM-20 Section 7.K.4, documentation of any CDHS criteria met, listing of CDHS criteria not met, and documentation of the reserve level with and without the SHS being modeled as if it were a CDHS.

a. Investment Officer on Investments – A certification from a duly authorized investment officer that the modeled company investment strategy, including any CDHS and any SHS that is required to be modeled pursuant to VM-20 Section 7.K.4, is representative of and consistent with the company’s investment policy.

b. Qualified Actuary on Investments – A certification by a qualified actuary, not necessarily the same qualified actuary that has been assigned responsibility for the PBR Actuarial Report or this sub-report, that the modeling of any clearly defined hedging strategies CDHS and any SHS that is required to be modeled pursuant to VM-20 Section 7.K.4 was performed in accordance with VM-20 and in compliance with all applicable ASOPs, and the alternative investment strategy as defined in VM-20 Section 7.E.1.g reflects the prescribed mix of assets with the same WAL as the reinvestment assets in the company investment strategy.

VM-31 Section 3.E.5

Assets and Risk Management – A brief description of the general account asset portfolio, and the approach used to model risk management strategies, such as hedging and other derivative programs, including a description of any CDHS or any SHS that is required to be modeled pursuant to VM-21 Section 9.A.6 clearly defined hedging strategies, and any material changes to the hedging strategy from the prior year.
VM-31 Section 3.F.8

Hedging and Risk Management – The following information regarding the hedging and risk management assumptions used by the company in performing a principle-based valuation under VM-21:

a. Strategies – Detailed description of risk management strategies, such as hedging and other derivative programs, including any CDHS or any SHS that is required to be modeled pursuant to VM-21 Section 9.A.6, specific to the groups of contracts covered in this sub-report.
   i. Descriptions of basis risk, gap risk, price risk and assumption risk.
   ii. Methods and criteria for estimating the a priori effectiveness of the strategy.
   iii. Results of any reviews of actual historical hedging effectiveness.

b. CDHS – Documentation for any hedging strategy that meets the requirements to be a CDHS.

c. Other Modeled Hedging Strategies – Documentation for any SHS that is required to be modeled pursuant to VM-21 Section 9.A.6, including documentation of any CDHS criteria met, listing of CDHS criteria not met, and documentation of the TAR level with and without the SHS being modeled as if it were a CDHS.

c-d. Strategy Changes – Discussion of any changes to the hedging strategy during the past 12 months, including identification of the change, reasons for the change, and the implementation date of the change.

c-e. Hedge Modeling – Description of how the hedge strategy was incorporated into modeling, including:
   i. Differences in timing between model and actual strategy implementation.
   ii. For a company that does not have a CDHS or a SHS that is required to be modeled pursuant to VM-21 Section 9.A.6, disclosure of the method used to consider hedge assets included in the starting assets, either (1) including the asset cash flows in the projection model; or (2) replacing the hedge positions with cash and/or other general account assets in an amount equal to the market value of the hedge positions, as discussed in VM-21 Section 4.A.4.a.
   iii. Evaluations of the appropriateness of the assumptions on future trading, transaction costs, other elements of the model, the strategy, and other items that are likely to result in materially adverse results.
   iv. If residual risks and frictional costs are assumed to have a value of zero, a demonstration that a value of zero is an appropriate expectation.
   v. Any discontinuous hedging strategies modeled, and where such discontinuous hedging strategies contribute materially to a reduction in the stochastic reserve, any evaluations of the interaction of future trigger definitions and the discontinuous hedging strategy, including any analyses of model assumptions that, when combined with the reliance on the discontinuous hedging strategy, may result in adverse results relative to those modeled.
   vi. Disclosure of any situations where the modeled hedging strategies make money in some scenarios without losing a reasonable amount in some other scenarios, and an explanation of why the situations are not material for determining the CTE 70 (best efforts).
   vii. Results of any testing of the method used to determine prices of financial instruments for trading in scenarios against actual initial market prices, including how the testing considered historical relationships. If there are substantial discrepancies, disclosure of the substantial discrepancies and documentation as to why the model-based prices are appropriate for determining the stochastic reserve.
viii. Any model adjustments made when calculating CTE 70 (adjusted), in particular, any liquidation or substitution of assets for currently held hedges.

c. Error Factor (\( E \)) and Back-Testing – Description of \( E \), the error factor, and formal back-tests performed, including:
   i. The value of \( E \), and the approach and rationale for the value of \( E \) used in the reserve calculation.
   ii. For companies that model hedge cash flows using the explicit method, as described in VM-21 Section 9.C.6.a, and have 12 months of experience, an analysis of at least the most recent 12 months of experience and the results of a back-test showing that the model is able to replicate the hedging results experienced in a way that justifies the value used for \( E \). Include at least a ratio of the actual change in market value of the hedges to the modeled change in market value of the hedges at least quarterly.
   iii. For companies that model hedge cash flows using the implicit method, and have 12 months of experience, as described in VM-21 Section 9.C.6.b, the results of a back-test in which (a) actual hedge asset gains and losses are compared against (b) proportional fair value movements in hedged liability, including:
      a) Delta, rho and vega coverage ratios in each month over the back-testing period, which may be presented in a chart or graph.
      b) The implied volatility level used to quantify the fair value of the hedged item, as well as the methodology undertaken to determine the appropriate level used.
   iv. For companies that do not model hedge cash flows using either the explicit method or the implicit method, as described in VM-21 Section 9.C.6.c, and have 12 months of experience, the results of the formal back-test conducted to validate the appropriateness of the selected method and value used for \( E \).
   v. For companies that do not have 12 months of experience, the basis for the value of \( E \) is chosen based on the guidance provided in VM-21 Section 9.C.7, considering the actual history available and the degree and nature of any changes made to the hedge strategy.

f. Safe Harbor for CDHS – If electing the safe harbor approach for CDHS, as discussed in VM-21 Section 9.C.8, a description of the linear instruments used to model the option portfolio.

g. Hedge Model Results – Disclosure of whether the calculated CTE 70 (best efforts) is below both the fair value and CTE 70 (adjusted), and if so, justification for why that result is reasonable, as discussed in VM-21 Section 9.D.

**VM-31 Section 3.F.12.c**

CTEPA – If using the CTEPA method, a summary including:
   i. Disclosure (in tabular form) of the scenario reserves using the same method and assumptions as those used by the company to calculate CTE 70 (adjusted) as outlined in VM-21 Section 9.C (or the stochastic reserves following VM-21 Section 4.A.4.a for a company that does not have a CDHS or a SHS that is required to be modeled pursuant to VM-21 Section 9.A.6), as well as the corresponding scenarios reserves substituting the assumptions prescribed by VM-21 Section 6.C.
ii. Summary of results from a cumulative decrement projection along the scenario whose reserve value is closest to the CTE 70 (adjusted), as outlined in VM-21 Section 9.C (or the stochastic reserves following VM-21 Section 4.A.4.a for a company that does not have a CDHS or a SHS that is required to be modeled pursuant to VM-21 Section 9.A.6), under the assumptions outlined in VM-21 Section 6.C. Such a cumulative decrement projection shall include, at the end of each projection year, the projected proportion (expressed as a percent of the total projected account value) of persisting contracts as well as the allocation of projected decrements across death, full surrender, account value depletion, elective annuitization, and other benefit election.

iii. Summary of results from a cumulative decrement projection, identical to (ii) above, but replacing all assumptions outlined in VM-21 Section 6.C with the corresponding assumptions used in calculating the stochastic reserve.

**VM-31 Section 3.F.16.a and Section 3.F.16.b**

a. **Investment Officer on Investments** – A certification from a duly authorized investment officer that the modeled asset investment strategy, including any CDHS and any SHS that is required to be modeled pursuant to VM-21 Section 9.A.6, is consistent with the company’s current investment strategy except where the modeled reinvestment strategy may have been substituted with the alternative investment strategy, and also any CDHS meets the requirements of a CDHS.

b. **Qualified Actuary on Investments** – A certification by a qualified actuary, not necessarily the same qualified actuary that has been assigned responsibility for the PBR Actuarial Report or this sub-report, that the modeling of any clearly defined hedging strategies CDHS and any SHS that is required to be modeled pursuant to VM-21 Section 9.A.6 was performed in accordance with VM-21 and in compliance with all applicable ASOPs.
Life Actuarial (A) Task Force/Health Actuarial (B) Task Force
Amendment Proposal Form*

1. Identify yourself, your affiliation and a very brief description (title) of the issue.

**Identification:**
Rachel Hemphill and Karen Jiang, Texas Department of Insurance

**Title of the Issue:**
Create consistency between CDHS determination in VM-20 and VM-21. Revise hedge modeling to only require CDHS if modeling future hedging reduces the reserves under VM-20 or TAR under VM-21.

2. Identify the document, including the date if the document is “released for comment,” and the location in the document where the amendment is proposed:

January 1, 2021 NAIC Valuation Manual

3. Show what changes are needed by providing a red-line version of the original verbiage with deletions and identify the verbiage to be deleted, inserted or changed by providing a red-line (turn on “track changes” in Word®) version of the verbiage. (You may do this through an attachment.)

See attached.

4. State the reason for the proposed amendment? (You may do this through an attachment.)

---

**Summary of 5/17/2021 Editorial Changes and Clarifications:**

1. Editorial changes were made in response to the comment by John Robinson of MN:
   a. Replace “hedge” with “hedging” when used as an adjective.
   b. Clarify that the Principles apply to the modeling of a CDHS or SHS.
   c. Add references to “one or more” CDHS or SHS, to reflect that a company may have multiple CDHS or SHS.
   d. Add reference to a CDHS that the company is following.

2. Clarifying edits were made in response to the comment ACLI:
   a. Clarify that PBR reflecting a company’s investment policy and risk management strategies supporting the policies or contracts does not target, deem illegitimate, or otherwise reflect a negative view on the company’s investment policy and risk management strategies supporting the policies or contracts. In fact, the opposite is true. Note that this is consistent with VM-20 Section 7.K.1’s treatment of non-hedging derivative use.
   b. Clarify even further that the CDHS requirements are documentation requirements (i.e., documentation clearly defining the hedging strategy) and may always be satisfied at the company’s option.
Summary of 4/2/2021 Updates:

1. Revisions were made to VM-20 Section 7.K.4 (add “supporting the policies”) and VM-21 Section 9.A.6 (add “supporting the contracts”) in response to Nationwide’s comments.
2. We added a definition for “hedging transactions,” taken from the APPM but modified slightly to be consistent with Valuation Manual terminology in response to Will Wilton’s comments.
3. We have updated the list of CDHS criteria in response to Will Wilton’s comments where we agreed:
   a. Added "significant" before risks in item (c) of the CDHS definition.
   b. Combined items (f) – (h) in the CDHS definition.
   c. Change "person or persons" to "group or area, including whether internal or external," in item (j) of the CDHS definition.
   d. We did not remove items (k) or (l) as suggested by Will Wilton, as we find this information useful to regulators. Given that these are retained, and because we were uncertain what else would be included in the new “primary risks” item suggested by Will Wilton, we have not added it. If we can be provided additional information on the risks to be reflected under this new item, an edit could be made.
4. We modified the definition of a SHS to clarify “normally modelled” in response to the ACLI comment and clarify what may be a SHS in response to Will Wilton’s comment (e.g., a single bond would not be a SHS).

We have added comment bubbles in the draft below to flag where we have made edits or chosen not to make edits and why.

We propose having consistent requirements for a CDHS in VM-20 and VM-21, as well as any future work on VM-22, and consolidating these requirements in the VM-01 definition of a CDHS. This involves adding two criteria to VM-21’s definition of CDHS that currently exist for VM-20:

- Areas where basis, gap or assumption risk related to the hedging strategy have been identified.
- The circumstances under which hedging strategy will not be effective in hedging the risks.

These criteria are both reasonable and apply in principle to VM-21, and to any future work on VM-22, as well as VM-20.

Further, we propose revising the requirement for hedging to be a CDHS in order for future hedging to be modeled under VM-20, modeled under VM-21, and LR027’s C-3 RBC Amount calculation to only apply when modeling such hedging reduces the life reserve level or variable annuity Total Asset Requirement (TAR) level.

The current regulatory requirements for hedging to be a CDHS in order for future hedging to be modeled under VM-20, modeled under VM-21, modeled for the C-3 RBC Amount calculation for variable annuities, and to be eligible for SSAP 108 treatment are all logical requirements when one considers whether hedging should be allowed to reduce the life reserve level or variable annuity TAR level, or whether any mismatch between movements in hedge assets and movements in the corresponding reserve levels should be allowed to be amortized over time.
However, this same requirement has led to a situation of there being unintended optionality in whether a hedging strategy that is like a CDHS is modeled or is not modeled, since a company may choose to satisfy or not satisfy certain of the criteria. This has been especially relevant for cases where modeling a company’s hedging strategy would increase reserves or variable annuity TAR.

As noted in the current guidance note in VM-20 Section 7.K.1 in the 2021 Valuation Manual:

“The prohibition in these modeled reserve requirements against projecting future hedging transactions other than those associated with a clearly defined hedging strategy is intended to address initial concerns expressed by various parties that reserves could be unduly reduced by reflection of programs whose future execution and performance may have greater uncertainty. The prohibition appears, however, to be in conflict with Principle 2 listed in VM-21. Companies may actually execute and reflect in their risk assessment and evaluation processes hedging strategies similar in many ways to clearly defined hedging strategies but lack sufficient clarity in one or more of the qualification criteria. By excluding the associated derivative instruments, the investment strategy that is modeled may also not reflect the investment strategy the company actually uses. Further, because the future hedging transactions may be a net cost to the company in some scenarios and a net benefit in other scenarios, the exclusion of such transactions can result in a modeled reserve that is either lower or higher than it would have been if the transactions were not excluded. The direction of such impact on the reserves could also change from period to period as the actual and projected paths of economic conditions change. A more graded approach to recognition of non-qualifying hedging strategies may be more theoretically consistent with Principle 2. It is recommended that as greater experience is gained by actuaries and state insurance regulators with the principle-based approach and as industry hedging programs mature, the various requirements of this section be reviewed.”

We propose to continue addressing the regulatory concern that reserves could be unduly reduced by reflection of programs whose future execution and performance may have greater uncertainty, by continuing to only allowing hedging strategies that qualify as a CDHS to reduce life reserves and variable annuity TAR. However, we propose that the treatment of CDHS be made more principles-based and less subject to manipulation. To accomplish this, the proposal requires that any hedging strategy that is a part of the investment strategy supporting the policies and is normally modeled as part of the company’s risk assessment and evaluation processes be modeled as if it were a CDHS if doing so results in an increase in life reserves or variable annuity TAR.

That is, CDHS becomes a requirement solely for hedging strategies that reduce life reserves or variable annuity TAR, and so becomes a more clear regulatory guardrail requiring that hedging strategies that reduce life reserves or variable annuity TAR must be clearly defined.

We continue to need the concept of a CDHS. A CDHS simply formally documents items that a company should be able to document for a robust, well-defined hedging strategy. It requires that the following be identified:

a. The specific risks being hedged (e.g., cash flow, policy interest credits, delta, rho, vega, etc.).

b. The hedge objectives.

c. The risks that are not hedged (e.g., variation from expected mortality, withdrawal, and other utilization or decrement rates assumed in the hedging strategy, etc.).

d. The financial instruments used to hedge the risks.

e. The hedge trading rules, including the permitted tolerances from hedging objectives.

f. The metrics for measuring hedging effectiveness.

g. The criteria used to measure hedging effectiveness.

h. The frequency of measuring hedging effectiveness.
i. The conditions under which hedging will not take place.

j. The person or persons responsible for implementing the hedging strategy.

k. Areas where basis, gap or assumption risk related to the hedging strategy have been identified.

l. The circumstances under which hedging strategy will not be effective in hedging the risks.

While the last two criteria have historically applied for life but not variable annuities, these are all reasonable documentation items that for a robust, well-defined hedging strategy regardless of whether the product is life or variable annuity.

The concept of a CDHS is used for accounting in SSAP 108. SSAP 108 allows companies to set up a deferred asset or liability to amortize the mismatch between changes in the value of the liability and changes in the value of the hedging instruments attributable to the hedged risk underlying a highly effective CDHS modeled for VM-21. Allowing this treatment encourages companies to reduce risk through robust, well-defined and highly effective hedging. Without having the hedging strategy be well-defined, regulators could not rely on past effectiveness being indicative of future effectiveness, and so could not offer companies the benefit of SSAP 108 treatment. Once we recognize the need for a concept of a well-defined hedging strategy, the only question is what criteria would need to be met to be considered well-defined—that is, what criteria should be required to be considered a CDHS. This is a distinct question from whether the concept of a CDHS is needed. We have not heard critiques of individual criteria in the CDHS definition, but consideration of the criteria is appropriate as we go forward to make the definitions in VM-20 and VM-21 consistent. Similarly, in reserve and capital calculations, we rely on the concept of historical effectiveness to determine an error factor. If modeling hedging reduces the reserve or capital amount, the error factor determines the magnitude to which this is reflected. However, this use of the historical effectiveness relies on the hedging strategy being well-documented and comparable between historical hedging and planned future hedging. So, again, a need for hedging strategies to be well-defined presents itself—a CDHS concept is needed.

Finally, edits to VM-31 are needed to reflect these updates and bring VM-20 and VM-21 reporting requirements more in line with one another where appropriate.

**Note on Coordination with RBC and APPM:** We have reviewed, and with these edits there are no corresponding edits necessary for LR027 for RBC but corresponding edits are necessary for SSAP 108. A referral to SAPWG is to be concurrently considered with this APF.
The term “clearly defined hedging strategy” (CDHS) means a strategy undertaken by a company to manage risks through the future purchase or sale of hedging instruments and the opening and closing of hedging positions. A CDHS must identify:

- a. The specific risks being hedged (e.g., cash flow, policy interest credits, delta, rho, vega, etc.).
- b. The hedging objectives.
- c. The significant risks that are not hedged (e.g., variation from expected mortality, withdrawal, and other utilization or decrement rates assumed in the hedging strategy, etc.).
- d. The financial instruments used to hedge the risks.
- e. The hedging strategy’s trading rules, including the permitted tolerances from hedging objectives.
- f. The metrics, criteria, and frequency for measuring hedging effectiveness.
- g. The conditions under which hedging will not take place.
- h. The group or area, including whether internal or external, responsible for implementing the hedging strategy.
- i. Areas where basis, gap or assumption risk related to the hedging strategy have been identified.
- j. The circumstances under which hedging strategy will not be effective in hedging the risks.

The hedging strategy may be dynamic, static or a combination thereof. A strategy involving the offsetting of the risks associated with products falling under the scope of different requirements within the Valuation Manual (e.g., VM-20, VM-21, or VM-22) does not qualify as CDHS.

Guidance Note: All of the principles outlined in VM-21 Section 1.B (particularly Principle 5) apply to the modeling of a CDHS.

The term “hedging transaction” means a derivative(s) transaction which is entered into and maintained to reduce:

- a. The risk of a change in the fair value or cash flow of assets and liabilities which the company has acquired or incurred or has a firm commitment to acquire or incur or for which the company has a forecasted acquisition or incurrence; or
- b. The currency exchange rate risk or the degree of foreign currency exposure in assets and liabilities which the company has acquired or incurred or has a firm commitment to acquire or incur or for which the company has forecasted acquisition or incurrence.

The term “Seasoned Hedging Strategy” (SHS) means a hedging strategy that is part of the company’s investment strategy and for which future hedging transactions are normally modeled as part of any of the company’s risk assessment and evaluation processes. A SHS may or may not be a CDHS.

Guidance Note: All of the principles outlined in VM-21 Section 1.B (particularly Principle 5) apply to the modeling of a SHS.
VM-20 Section 6.A.1.b

A company may not exclude a group of policies for which there is one or more CDHS or one or more SHS required to be modeled pursuant to Section 7.K.4 from stochastic reserve requirements, except in the case where all CDHS and all SHS required to be modeled pursuant to Section 7.K.4 are solely associated with product features that are determined to not be material under Section 7.B.1 due to low utilization.

VM-20 Section 7.E.1.g

Notwithstanding the above requirements, the modeled reserve shall be the higher of that produced by the model investment strategy and that produced by substituting an alternative investment strategy in which the fixed income reinvestment assets have the same weighted average life (WAL) as the reinvestment assets in the model investment strategy and are all public non-callable corporate bonds with gross asset spreads, asset default costs and investment expenses by projection year that are consistent with a credit quality blend of 50% PBR credit rating 6 (A2/A) and 50% PBR credit rating 3 (Aa2/AA).

Policy loans, equities and derivative instruments associated with the execution of a CDHS (in compliance with the definition of CDHS in VM-01) or a SHS that is required to be modeled pursuant to Section 7.K.4 are not affected by this requirement.

VM-20 Section 7.K

K. Modeling of Derivative Programs

1. When determining the deterministic reserve and the stochastic reserve, the company shall include in the projections the appropriate costs and benefits of derivative instruments that are currently held by the company in support of the policies subject to these requirements. The company shall also include the appropriate costs and benefits of anticipated future derivative instrument transactions associated with the execution of a CDHS or a SHS that is required to be modeled pursuant to Section 7.K.4, as well as the appropriate costs and benefits of anticipated future derivative instrument transactions associated with non-hedging derivative programs (e.g., replication, income generation) undertaken as part of the investment strategy supporting the policies, provided they are normally modeled as part of the company’s risk assessment and evaluation processes.

2. For each derivative program that is modeled, the company shall reflect the company’s established investment policy and procedures for that program; project expected program performance along each scenario; and recognize all benefits, residual risks and associated frictional costs. The residual risks include, but are not limited to: basis, gap, price, parameter estimation and variation in assumptions (mortality, persistency, withdrawal, etc.). Frictional costs include, but are not limited to: transaction, margin (opportunity costs associated with margin requirements) and administration. For CDHS or SHS required to be modeled pursuant to Section 7.K.4, the company may not assume that residual risks and frictional costs have a value of zero, unless the company demonstrates in the PBR Actuarial Report that “zero” is an appropriate expectation.

3. In circumstances where one or more material risk factors related to a derivative program are not fully captured within the cash-flow model used to calculate CTE 70, the company shall reflect such risk factors by increasing the stochastic reserve as described in Section 8.E.
4. If a SHS supporting the policies is not a CDHS but modeling it would result in a material increase to the company’s minimum reserve, then the company shall model the SHS as if it were a CDHS when calculating reserves under VM-20. In addition, if modeling the SHS as if it were a CDHS would result in a decrease in the company’s minimum reserve, the company may provide the documentation required for the SHS to be a CDHS as defined in VM-01 and then model the SHS as a CDHS.

**Guidance Note:** The intent of reflecting SHS is not to penalize any hedging strategies, but rather to reflect the company’s investment strategy and risk management strategies, including all material established hedging strategies supporting the policies, while requiring CDHS documentation for any such hedging strategies that reduce the minimum reserve.

**VM-20 Section 7.L (Remove entire Section 7.L)**

**Deleted:**

- L. Clearly Defined Hedging Strategy
  - A clearly defined hedging strategy must identify:
    - The specific risks being hedged (e.g., cash flow, policy interest credits, delta, rho, vega, etc.).
    - The hedge objectives.
    - The risks that are not hedged (e.g., variation from expected mortality, withdrawal, and other utilization or decrement rates assumed in the hedging strategy, etc.).
    - The financial instruments used to hedge the risks.
    - The hedge trading rules, including the permitted tolerances from hedging objectives.
    - The metrics for measuring hedging effectiveness.
    - The criteria used to measure hedging effectiveness.
    - The frequency of measuring hedging effectiveness.
    - The person or persons responsible for implementing the hedging strategy.
    - Areas where basis, gap or assumption risk related to the hedging strategy have been identified.
    - The circumstances under which hedging strategy will not be effective in hedging the risks.
  - Hedging strategies involving the offsetting of the risks associated with other products outside of the scope of these requirements is not a clearly defined hedging strategy.

**Guidance Note:** For purposes of the above criteria, “effectiveness” need not be measured in a manner as defined in SSAP No. 86— Derivatives in the AP&P Manual.
VM-21 Section 1.D.2 (Delete entire definition and renumber subsequent sections VM-21 Section 1.D.3 and VM-21 Section 1.D.4)

VM-21 Section 4.A.4

Modeling of Hedges

a. For a company that does not have a CDHS or a SHS that is required to be modeled pursuant to Section 9.A.6:

i. The company shall not consider the cash flows from any future hedge purchases or any rebalancing of existing hedge assets in its modeling.

ii. Existing hedging instruments that are currently held by the company in support of the contracts falling under the scope of these requirements shall be included in the starting assets. The hedge assets may then be considered in one of two ways:

a) Include the asset cash flows from any contractual payments and maturity values in the projection model; or

b) No hedge positions – in which case the hedge positions held on the valuation date are replaced with cash and/or other general account assets in an amount equal to the aggregate market value of these hedge positions.

Guidance Note: If the hedge positions held on the valuation date are replaced with cash, then as with any other cash, such amounts may then be invested following the company’s investment strategy.

A company may switch from method a) to method b) at any time, but it may only change from b) to a) with the approval of the domiciliary commissioner.

b. For a company following one or more CDHS or one or more SHS that are required to be modeled pursuant to Section 9.A.6, the detailed requirements for the modeling of hedges are defined in Section 9. The following paragraphs are a high-level summary and do not supersede the detailed requirements.

i. The appropriate costs and benefits of hedging instruments that are currently held by the company in support of the contracts falling under the scope of these requirements shall be included in the projections used in the determination of the stochastic reserve.

ii. The projections shall take into account the appropriate costs and benefits of hedge positions expected to be held in the future through the execution of a CDHS or a SHS that is required to be modeled pursuant to Section 9.A.6. Because models do not always accurately portray the results of hedge programs, the company shall, through back-testing and other means, assess the accuracy of the hedge modeling. The company shall determine a stochastic reserve as the weighted average of two CTE values; first, a CTE70 (“best efforts”) representing the company’s projection of all of the hedge cash flows, including future hedge purchases, and a second CTE70 (“adjusted”) which shall use only hedge assets held by the company on the valuation date and no future hedge purchases. These are discussed in greater detail in Section 9. The stochastic reserve shall be the weighted average of the two CTE70 values, where the weights reflect the error factor (E) determined following the guidance of Section 9.C.4.
iii. The company is responsible for verifying compliance with CDHS requirements or SHS requirements if required to be modeled pursuant to Section 9.A.6 and any other requirements in Section 9 for all hedging instruments included in the projections.

iv. The use of products not falling under the scope of these requirements (e.g., equity-indexed annuities) as a hedge shall not be recognized in the determination of accumulated deficiencies.

**VM-21 Section 4.D.4.b**

Notwithstanding the above requirements, the model investment strategy and any non-prescribed asset spreads shall be adjusted as necessary so that the aggregate reserve is not less than that which would be obtained by substituting an alternative investment strategy in which all fixed income reinvestment assets are public non-callable corporate bonds with gross asset spreads, asset default costs, and investment expenses by projection year that are consistent with a credit quality blend of 50% PBR credit rating 6 (A2/A) and 50% PBR credit rating 3 (Aa2/AA).

Policy loans, equities and derivative instruments associated with the execution of a CDHS (in compliance with the definition of CDHS in VM-01) or a SHS that is required to be modeled pursuant to Section 9.A.6 are not affected by this requirement.

**VM-21 Section 6.B.3.a.ii – Footnote (Footnote at Bottom of Page 21-22)**

Throughout this Section 6, references to CTE70 (adjusted) shall also mean the Stochastic Reserve for a company that does not have a CDHS or a SHS that is required to be modeled pursuant to Section 9.A.6 as discussed in Section 4.A.4.a.

**VM-21 Section 6.B.3.b.ii**

Calculate the Prescribed Projections Amount as the CTE70 (adjusted) using the same method as that outlined in Section 9.C (which is the same as the stochastic reserves following Section 4.A.4.a for a company that does not have a CDHS or a SHS that is required to be modeled pursuant to Section 9.A.6) but substituting the assumptions prescribed by Section 6.C. The calculation of this Prescribed Projections Amount also requires that the scenario reserve for any given scenario be equal to or in excess of the cash surrender value in aggregate on the valuation date for the group of contracts modeled in the projection.

**VM-21 Section 6.B.5**

Cash flows associated with hedging shall be projected in the same manner as that used in the calculation of the CTE70 (adjusted) as discussed in Section 9.C or Section 4.A.4.a for a company without a CDHS or a SHS that is required to be modeled pursuant to Section 9.A.6.
VM-21 Section 9

Section 9: Modeling of Hedges under a CDHS

A. Initial Considerations

1. Subject to Section 9.C.2, the appropriate costs and benefits of hedging instruments that are currently held by the company in support of the contracts falling under the scope of these requirements shall be included in the calculation of the stochastic reserve, determined in accordance with Section 3.D and Section 4.D.

2. If the company is following one or more CDHS, in accordance with an investment policy adopted by the board of directors, or a committee of board members, the company shall take into account the costs and benefits of hedge positions expected to be held by the company in the future along each scenario based on the execution of the hedging strategy, and it is eligible to reduce the amount of the stochastic reserve using projections otherwise calculated. The investment policy must clearly articulate the company’s hedging objectives, including the metrics that drive rebalancing/trading. This specification could include maximum tolerable values for investment losses, earnings, volatility, exposure, etc. in either absolute or relative terms over one or more investment horizons vis-à-vis the chance of occurrence. Company management is responsible for developing, documenting, executing and evaluating the investment strategy, including the hedging strategy, used to implement the investment policy.

3. For this purpose, the investment assets refer to all the assets, including derivatives supporting covered products and guarantees. This also is referred to as the investment portfolio. The investment strategy is the set of all asset holdings at all points in time in all scenarios. The hedging portfolio, which also is referred to as the hedging assets, is a subset of the investment assets. The hedging strategy is the hedging asset holdings at all points in time in all scenarios. There is no attempt to distinguish what is the hedging portfolio and what is the investment portfolio in this section. Nor is the distinction between investment strategy and hedging strategy formally made here. Where necessary to give effect to the intent of this section, the requirements applicable to the hedging portfolio or the hedging strategy are to apply to the overall investment portfolio and investment strategy.

4. This particularly applies to restrictions on the reasonableness or acceptability of the models that make up the stochastic cash-flow model used to perform the projections, since these restrictions are inherently restrictions on the joint modeling of the hedging and non-hedging portfolio. To give effect to these requirements, they must apply to the overall investment strategy and investment portfolio.

5. Before either a new or revised hedging strategy can be used to reduce the amount of the stochastic reserve otherwise calculated, the hedging strategy should be in place (i.e., effectively implemented by the company) for at least three months. The company may meet the time requirement by having evaluated the effective implementation of the hedging strategy for at least three months without actually having executed the trades indicated by the hedging strategy (e.g., mock testing or by having effectively implemented the strategy with similar annuity products for at least three months).

6. If a SHS supporting the contracts is not a CDHS but modeling it as if it were a CDHS would result in a material increase in the company’s TAR, then the company shall model the SHS as a CDHS. In addition, if modeling the SHS as a CDHS would result in a decrease in the company’s TAR, the company may provide the documentation required for the SHS to be a CDHS as defined in VM-01 and then model the SHS as a CDHS when calculating reserves under AG43 and/or VM-21 when calculating the C-3 RBC Amount under LR027. The company shall not treat a SHS as a CDHS for purposes of SSAP 108 without providing the documentation required for the SHS to be a CDHS as defined in VM-01.

Guidance Note: The intent of reflecting SHS is not to penalize any hedging strategies, but rather to reflect the company’s investment strategy and risk management strategies, including all material established.
hedging strategies supporting the contracts, while requiring CDHS documentation for any such hedging strategies that reduce TAR.

B. Modeling Approaches

1. The analysis of the impact of the hedging strategy on cash flows is typically performed using either one of two types of methods as described below. Although a hedging strategy normally would be expected to reduce risk provisions, the nature of the hedging strategy and the costs to implement the strategy may result in an increase in the amount of the stochastic reserve otherwise calculated.

2. The fundamental characteristic of the first type of method, referred to as the “explicit method,” is that hedging positions and their resulting cash flows are included in the stochastic cash-flow model used to determine the scenario reserve, as discussed in Section 3.D, for each scenario.

3. The fundamental characteristic of the second type of method, referred to as the “implicit method,” is that the effectiveness of the current hedging strategy on future cash flows is evaluated, in part or in whole, outside of the stochastic cash-flow model. There are multiple ways that this type of modeling can be implemented. In this case, the reduction to the stochastic reserve otherwise calculated should be commensurate with the degree of effectiveness of the hedging strategy in reducing accumulated deficiencies otherwise calculated.

4. Regardless of the methodology used by the company, the ultimate effect of the current hedging strategy (including currently held hedge positions) on the stochastic reserve needs to recognize all risks, associated costs, imperfections in the hedges and hedging mismatch tolerances associated with the hedging strategy. The risks include, but are not limited to: basis, gap, price, parameter estimation and variation in assumptions (mortality, persistency, withdrawal, annuitization, etc.). Costs include, but are not limited to: transaction, margin (opportunity costs associated with margin requirements) and administration. In addition, the reduction to the stochastic reserve attributable to the hedging strategy may need to be limited due to the uncertainty associated with the company’s ability to implement the hedging strategy in a timely and effective manner. The level of operational uncertainty varies indirectly with the amount of time that the new or revised strategy has been in effect or mock tested.

Guidance Note: No hedging strategy is perfect. A given hedging strategy may eliminate or reduce some but not all risks, transform some risks into others, introduce new risks, or have other imperfections. For example, a delta-only hedging strategy does not adequately hedge the risks measured by the “Greeks” other than delta. Another example is that financial indices underlying typical hedging instruments typically do not perform exactly like the separate account funds, and hence the use of hedging instruments has the potential for introducing basis risk.

5. A safe harbor approach is permitted for CDHS reflection for those companies whose modeled hedge assets comprise only linear instruments not sensitive to implied volatility. For companies with option-based hedge strategies, electing this approach would require representing the option-based portion of the strategy as a delta-rho two-Greek hedge program. The normally modeled option portfolio would be replaced with a set of linear instruments that have the same first-order Greeks as the original option portfolio.

C. Calculation of Stochastic Reserve (Reported)

1. The company shall calculate CTE70 (best efforts)—the results obtained when the CTE70 is based on incorporating the CDHS (including both currently held and future hedge positions) into the stochastic cash-flow model on a best efforts basis, including all of the factors and assumptions needed to execute the CDHS
(e.g., stochastic implied volatility). The determination of CTE70 (best efforts) may utilize either explicit or implicit modeling techniques.

2. The company shall calculate a CTE70 (adjusted) by recalculating the CTE70 assuming the company has no CDHS, therefore following the requirements of Section 4.A.4.a.

3. Because most models will include at least some approximations or idealistic assumptions, CTE70 (best efforts) may overstate the impact of the hedging strategy. To compensate for potential overstatement of the impact of the hedging strategy, the value for the stochastic reserve is given by:

\[
\text{Stochastic reserve} = \text{CTE70 (best efforts)} + E \times \max[0, \text{CTE70 (adjusted)} - \text{CTE70 (best efforts)}]
\]

4. The company shall specify a value for \( E \) (the “error factor”) in the range from 5% to 100% to reflect the company’s view of the potential error resulting from the level of sophistication of the stochastic cash-flow model and its ability to properly reflect the parameters of the hedging strategy (i.e., the Greeks being covered by the strategy), as well as the associated costs, risks and benefits. The greater the ability of the stochastic model to capture all risks and uncertainties, the lower the value of \( E \). The value of \( E \) may be as low as 5% only if the model used to determine the CTE70 (best efforts) effectively reflects all of the parameters used in the hedging strategy. If certain economic risks are not hedged, yet the model does not generate scenarios that sufficiently capture those risks, \( E \) must be in the higher end of the range, reflecting the greater likelihood of error. Likewise, simplistic hedge cash-flow models shall assume a higher likelihood of error.

5. The company shall conduct a formal back-test, based on an analysis of at least the most recent 12 months, to assess how well the model is able to replicate the hedging strategy in a way that supports the determination of the value used for \( E \).

6. Such a back-test shall involve one of the following analyses:
   a. For companies that model hedge cash flows directly (“explicit method”), replace the stochastic scenarios used in calculating the CTE70 (best efforts) with a single scenario that represents the market path that actually manifested over the selected back-testing period and compare the projected hedge asset gains and losses against the actual hedge asset gains and losses – both realized and unrealized – observed over the same time period. For this calculation, the model assumptions may be replaced with parameters that reflect actual experience during the back-testing period. In order to isolate the comparison between the modeled hedge strategy and actual hedge results for this calculation, the projected liabilities should accurately reflect the actual liabilities throughout the back-testing period; therefore, adjustments that facilitate this accuracy (e.g. reflecting actual experience instead of model assumptions, including new business, etc.) are permissible.

   To support the choice of a low value of \( E \), the company should ascertain that the projected hedge asset gains and losses are within close range of 100% (e.g., 80–125%) of the actual hedge asset gains and losses. The company may also support the choice of a low value of \( E \) by achieving a high R-squared (e.g., 0.80 or higher) when using a regression analysis technique.

   b. For companies that model hedge cash flows implicitly by quantifying the cost and benefit of hedging using the fair value of the hedged item (an “implicit method” or “cost of reinsurance method”), calculate the delta, rho and vega coverage ratios in each month over the selected back-testing period in the following manner:

   i. Determine the hedge asset gains and losses—both realized and unrealized—incurred over the month attributable to equity, interest rate, and implied volatility movements.
ii. Determine the change in the fair value of the hedged item over the month attributable to equity, interest rate, and implied volatility movements. The hedged item should be defined in a manner that reflects the proportion of risks hedged (e.g., if a company elects to hedge 50% of a contract’s market risks, it should quantify the fair value of the hedged item as 50% of the fair value of the contract).

iii. Calculate the delta coverage ratio as the ratio between (i) and (ii) attributable to equity movements.

iv. Calculate the rho coverage ratio as the ratio between (i) and (ii) attributable to interest rate movements.

v. Calculate the vega coverage ratio as the ratio between (i) and (ii) attributable to implied volatility movements.

vi. To support the company’s choice of a low value of E, the company should be able to demonstrate that the delta and rho coverage ratios are both within close range of 100% (e.g., 80–125%) consistently across the back-testing period.

vii. In addition, the company should be able to demonstrate that the vega coverage ratio is within close range of 100% in order to use the prevailing implied volatility levels as of the valuation date in quantifying the fair value of the hedged item for the purpose of calculating CTE70 (best efforts) in a manner consistent with the realized volatility of the scenarios captured in the CTE (best efforts).

c. Companies that do not model hedge cash flows explicitly, but that also do not use the implicit method as outlined in Section 9.C.6.b above, shall conduct the formal back-test in a manner that allows the company to clearly illustrate the appropriateness of the selected method for reflecting the cost and benefit of hedging, as well as the value used for E.

7. A company that does not have 12 months of experience to date shall set E to a value that reflects the amount of experience available, and the degree and nature of any change to the hedge program. For a material change in strategy, with no history, E should be at least 0.50. However, E may be lower than 0.50 if some reliable experience is available and/or if the change in strategy is a refinement rather than a substantial change in strategy.

Guidance Note: The following examples are provided as guidance for determining the E factor when there has been a change to the hedge program:

- The error factor should be temporarily large (e.g., ≥ 50%) for substantial changes in hedge methodology (e.g., moving from a fair-value based strategy to a stop-loss strategy) where the company has not been able to provide a meaningful simulation of hedge performance based on the new strategy.
- A temporary moderate increase (e.g., 15–30%) in error factor should be used for substantial modifications to hedge programs or CDHS modeling where meaningful simulation has not been created (e.g., adding second-order hedging, such as gamma or rate convexity).
- No increase in the error factor may be used for incremental modifications to the hedge strategy (e.g., adding death benefits to a program that previously covered only living benefits, or moving from swaps to Treasury Department futures).

D. Additional Considerations for CTE70 (best efforts)

If the company is following a CDHS, the fair value of the portfolio of contracts falling within the scope of these requirements shall be computed and compared to the CTE70 (best efforts) and CTE70 (adjusted). If the CTE70 (best efforts) is below both the fair value and CTE70 (adjusted), the company should be prepared to explain why that result is reasonable.
For the purposes of this analysis, the stochastic reserve and fair value calculations shall be done without requiring the scenario reserve for any given scenario to be equal to or in excess of the cash surrender value in aggregate for the group of contracts modeled in the projection.

E. Specific Considerations and Requirements

1. As part of the process of choosing a methodology and assumptions for estimating the future effectiveness of the current hedging strategy (including currently held hedge positions) for purposes of reducing the stochastic reserve, the company should review actual historical hedging effectiveness. The company shall evaluate the appropriateness of the assumptions on future trading, transaction costs, other elements of the model, the strategy, the mix of business and other items that are likely to result in materially adverse results. This includes an analysis of model assumptions that, when combined with the reliance on the hedging strategy, are likely to result in adverse results relative to those modeled. The parameters and assumptions shall be adjusted (based on testing contingent on the strategy used and other assumptions) to levels that fully reflect the risk based on historical ranges and foreseeable future ranges of the assumptions and parameters. If this is not possible by parameter adjustment, the model shall be modified to reflect them at either anticipated experience or adverse estimates of the parameters.

2. A discontinuous hedging strategy is a hedging strategy where the relationships between the sensitivities to equity markets and interest rates (commonly referred to as the Greeks) associated with the guaranteed contract holder options embedded in the variable annuities and other in-scope products and these same sensitivities associated with the hedging assets are subject to material discontinuities. This includes, but is not limited to, a hedging strategy where material hedging assets will be obtained when the variable annuity account balances reach a predetermined level in relationship to the guarantees. Any hedging strategy, including a delta hedging strategy, can be a discontinuous hedging strategy if implementation of the strategy permits material discontinuities between the sensitivities to equity markets and interest rates associated with the guaranteed contract holder options embedded in the variable annuities and other in-scope products and these same sensitivities associated with the hedging assets. There may be scenarios that are particularly costly to discontinuous hedging strategies, especially where those result in large discontinuous changes in sensitivities (Greeks) associated with the hedging assets. Where discontinuous hedging strategies contribute materially to a reduction in the stochastic reserve, the company must evaluate the interaction of future trigger definitions and the discontinuous hedging strategy, in addition to the items mentioned in the previous paragraph. This includes an analysis of model assumptions that, when combined with the reliance on the discontinuous hedging strategy, may result in adverse results relative to those modeled.

3. A strategy that has a strong dependence on acquiring hedging assets at specific times that depend on specific values of an index or other market indicators may not be implemented as precisely as planned.

4. The combination of elements of the stochastic cash-flow model—including the initial actual market asset prices, prices for trading at future dates, transaction costs and other assumptions—should be analyzed by the company as to whether the stochastic cash-flow model permits hedging strategies that make money in some scenarios without losing a reasonable amount in some other scenarios. This includes, but is not limited to: a. Hedging strategies with no initial investment that never lose money in any scenario and in some scenarios make money. b. Hedging strategies that, with a given amount of initial money, never make less than accumulation at the one-period risk-free rates in any scenario but make more than this in one or more scenarios.

5. If the stochastic cash-flow model allows for such situations, the company should be satisfied that the results do not materially rely directly or indirectly on the use of such strategies. If the results do materially rely directly or indirectly on the use of such strategies, the strategies may not be used to reduce the stochastic reserve otherwise calculated.
6. In addition to the above, the method used to determine prices of financial instruments for trading in scenarios should be compared to actual initial market prices. In addition to comparisons to initial market prices, there should be testing of the pricing models that are used to determine subsequent prices when scenarios involve trading financial instruments. This testing should consider historical relationships. For example, if a method is used where recent volatility in the scenario is one of the determinants of prices for trading in that scenario, then that model should approximate actual historic prices in similar circumstances in history.

VM-31 Section 3.C.5

Assets and Risk Management – A brief description of the asset portfolio, and the approach used to model risk management strategies, such as hedging, and other derivative programs, including a description of any CDHS and any SHS that is required to be modeled pursuant to VM-20 Section 7.K.4.

VM-31 Section 3.D.6.f

Risk Management – Detailed description of model risk management strategies, such as hedging and other derivative programs specific to the groups of policies covered in this sub-report and not discussed in the Life Summary Section 3.C.5. This should include documentation for any hedging strategy that meets the requirements to be a CDHS. It should also include, for any SHS that is not a CDHS, documentation of any CDHS criteria met, listing of CDHS criteria not met, and documentation of the impact on minimum reserves of the SHS being modeled as if it were a CDHS. In particular, such documentation should address the directional impact on minimum reserves and whether the impact is material.

a. Investment Officer on Investments – A certification from a duly authorized investment officer that the modeled company investment strategy, including any CDHS and any SHS that is required to be modeled pursuant to VM-20 Section 7.K.4, is representative of and consistent with the company’s investment policy.

b. Qualified Actuary on Investments – A certification by a qualified actuary, not necessarily the same qualified actuary that has been assigned responsibility for the PBR Actuarial Report or this sub-report, that the modeling of any CDHS and any SHS that is required to be modeled pursuant to VM-20 Section 7.K.4, was performed in accordance with VM-20 and in compliance with all applicable ASOPs, and the alternative investment strategy as defined in VM-20 Section 7.E.1.g reflects the prescribed mix of assets with the same WAL as the reinvestment assets in the company investment strategy.

VM-31 Section 3.E.5

Assets and Risk Management – A brief description of the general account asset portfolio, and the approach used to model risk management strategies, such as hedging and other derivative programs, including a description of any CDHS or any SHS that is required to be modeled pursuant to VM-21 Section 9.A.6, and any material changes to the hedging strategy from the prior year.
VM-31 Section 3.F.8

Hedging and Risk Management – The following information regarding the hedging and risk management assumptions used by the company in performing a principle-based valuation under VM-21:

a. Strategies – Detailed description of risk management strategies, such as hedging and other derivative programs, including any CDHS or any SHS that is required to be modeled pursuant to VM-21 Section 9.A.6, specific to the groups of contracts covered in this sub-report.
   i. Descriptions of basis risk, gap risk, price risk and assumption risk.
   ii. Methods and criteria for estimating the a priori effectiveness of the strategy.
   iii. Results of any reviews of actual historical hedging effectiveness.

b. CDHS – Documentation for any hedging strategy that meets the requirements to be a CDHS.

c. Other Modeled Hedging Strategies – Documentation for any SHS that is not a CDHS, including documentation of any CDHS criteria met, listing of CDHS criteria not met, and documentation of the impact on TAR of the SHS being modeled as if it were a CDHS. In particular, such documentation should address the directional impact on TAR and whether the impact is material.

d. Strategy Changes – Discussion of any changes to the hedging strategy during the past 12 months, including identification of the change, reasons for the change, and the implementation date of the change.

e. Hedge Modeling – Description of how the hedge strategy was incorporated into modeling, including:
   i. Differences in timing between model and actual strategy implementation.
   ii. For a company that does not have a CDHS or a SHS that is required to be modeled pursuant to VM-21 Section 9.A.6, disclosure of the method used to consider hedge assets included in the starting assets, either (1) including the asset cash flows in the projection model; or (2) replacing the hedge positions with cash and/or other general account assets in an amount equal to the market value of the hedge positions, as discussed in VM-21 Section 4.A.4.a.
   iii. Evaluations of the appropriateness of the assumptions on future trading, transaction costs, other elements of the model, the strategy, and other items that are likely to result in materially adverse results.
   iv. If residual risks and frictional costs are assumed to have a value of zero, a demonstration that a value of zero is an appropriate expectation.
   v. Any discontinuous hedging strategies modeled, and where such discontinuous hedging strategies contribute materially to a reduction in the stochastic reserve, any evaluations of the interaction of future trigger definitions and the discontinuous hedging strategy, including any analyses of model assumptions that, when combined with the reliance on the discontinuous hedging strategy, may result in adverse results relative to those modeled.
   vi. Disclosure of any situations where the modeled hedging strategies make money in some scenarios without losing a reasonable amount in some other scenarios, and an explanation of why the situations are not material for determining the CTE 70 (best efforts).
   vii. Results of any testing of the method used to determine prices of financial instruments for trading in scenarios against actual initial market prices, including how the testing considered historical relationships. If there are substantial discrepancies, disclosure of the substantial discrepancies and documentation as to why the model-based prices are appropriate for determining the stochastic reserve.
   viii. Any model adjustments made when calculating CTE 70 (adjusted), in particular, any liquidation or substitution of assets for currently held hedges.

e. Error Factor (E) and Back-Testing – Description of E, the error factor, and formal back-tests performed, including:
i.  The value of $E$, and the approach and rationale for the value of $E$ used in the reserve calculation.

ii. For companies that model hedge cash flows using the explicit method, as described in VM-21 Section 9.C.6.a, and have 12 months of experience, an analysis of at least the most recent 12 months of experience and the results of a back-test showing that the model is able to replicate the hedging results experienced in a way that justifies the value used for $E$. Include at least a ratio of the actual change in market value of the hedges to the modeled change in market value of the hedges at least quarterly.

iii. For companies that model hedge cash flows using the implicit method, and have 12 months of experience, as described in VM-21 Section 9.C.6.b, the results of a back-test in which (a) actual hedge asset gains and losses are compared against (b) proportional fair value movements in hedged liability, including:
   a) Delta, rho and vega coverage ratios in each month over the back-testing period, which may be presented in a chart or graph.
   b) The implied volatility level used to quantify the fair value of the hedged item, as well as the methodology undertaken to determine the appropriate level used.

iv. For companies that do not model hedge cash flows using either the explicit method or the implicit method, as described in VM-21 Section 9.C.6.c, and have 12 months of experience, the results of the formal back-test conducted to validate the appropriateness of the selected method and value used for $E$.

v. For companies that do not have 12 months of experience, the basis for the value of $E$ is chosen based on the guidance provided in VM-21 Section 9.C.7, considering the actual history available and the degree and nature of any changes made to the hedge strategy.

f. Safe Harbor for CDHS – If electing the safe harbor approach for CDHS, as discussed in VM-21 Section 9.C.8, a description of the linear instruments used to model the option portfolio.

g. Hedge Model Results – Disclosure of whether the calculated CTE 70 (best efforts) is below both the fair value and CTE 70 (adjusted), and if so, justification for why that result is reasonable, as discussed in VM-21 Section 9.D.

**VM-31 Section 3.F.12.c**

CTEPA – If using the CTEPA method, a summary including:

i. Disclosure (in tabular form) of the scenario reserves using the same method and assumptions as those used by the company to calculate CTE 70 (adjusted) as outlined in VM-21 Section 9.C (or the stochastic reserves following VM-21 Section 4.A.4.a for a company that does not have a CDHS or a SHS that is required to be modeled pursuant to VM-21 Section 9.A.6), as well as the corresponding scenarios reserves substituting the assumptions prescribed by VM-21 Section 6.C.

ii. Summary of results from a cumulative decrement projection along the scenario whose reserve value is closest to the CTE 70 (adjusted), as outlined in VM-21 Section 9.C (or the stochastic reserves following VM-21 Section 4.A.4.a for a company that does not have a CDHS or a SHS that is required to be modeled pursuant to VM-21 Section 9.A.6), under the assumptions outlined in VM-21 Section 6.C. Such a cumulative decrement projection shall include, at the end of each projection year, the projected proportion (expressed as a percent of the total projected account value) of persisting contracts as well as the allocation of projected decrements across death, full surrender, account value depletion, elective annuitization, and other benefit election.
Summary of results from a cumulative decrement projection, identical to (ii) above, but replacing all assumptions outlined in VM-21 Section 6.C with the corresponding assumptions used in calculating the stochastic reserve.

**VM-31 Section 3.F.16.a and Section 3.F.16.b**

a. **Investment Officer on Investments** – A certification from a duly authorized investment officer that the modeled asset investment strategy, including any CDHS and any SHS that is required to be modeled pursuant to VM-21 Section 9.A.6, is consistent with the company’s current investment strategy except where the modeled reinvestment strategy may have been substituted with the alternative investment strategy, and also any CDHS meets the requirements of a CDHS.

b. **Qualified Actuary on Investments** – A certification by a qualified actuary, not necessarily the same qualified actuary that has been assigned responsibility for the PBR Actuarial Report or this sub-report, that the modeling of any CDHS and any SHS that is required to be modeled pursuant to VM-21 Section 9.A.6 was performed in accordance with VM-21 and in compliance with all applicable ASOPs.

---

**Deleted:** clearly defined hedging strategies
The Life Actuarial (A) Task Force met May 13, 2021. The following Task Force members participated: Doug Slape, Chair, represented by Mike Boerner and Rachel Hemphill (TX); Judith L. French, Vice Chair, represented by Peter Weber (OH); Lori K. Wing-Heier represented by Sharon Comstock (AK); Jim L. Ridling represented by Jennifer Li and Steve Ostlund (AL); Ricardo Lara represented by Ben Bock and Perry Kupferman (CA); Michael Conway represented by Eric Unger (CO); Andrew N. Mais represented by Wanchin Chou (CT); Doug Ommen represented by Mike Yanacheak (IA); Dana Popish Severinghaus represented by Bruce Sartain and Vincent Tsang (IL); Vicki Schmidt represented by Nicole Boyd (KS); Grace Arnold represented by Fred Andersen and John Robinson (MN); Chlora Lindley-Myers represented by William Leung (MO); Eric Dunning represented by Rhonda Ahrens (NE); Marlene Caride represented by Kevin Clarkson (NJ); Linda A. Lacewell represented by Bill Carmello and Amanda Fenwick (NY); Glen Mulready represented by Andrew Schallhorn (OK); Jonathan T. Pike represented by Tomasz Serbinowski (UT); Scott A. White represented by Craig Chupp (VA); and James A. Dodrill represented by Tim Sigman and Joylynn Fix (WV).

1. **Discussed an Upcoming ILVA Meeting**

Mr. Weber provided descriptions of annuity products in the spectrum between fixed annuities and variable annuities. He said the products are marketed under various names, including index-linked variable annuities (ILVAs) and buffer annuities. He said the products are carved out of the Standard Nonforfeiture Law for Individual Deferred Annuities (#805), but they are not within the scope of the Variable Annuity Model Regulation (#250) because they do not follow the values in a separate account. He said regulator-to-regulator meetings will be scheduled to provide education on the indexed products, where specific company filings may be discussed. Those calls will be followed by open meetings to discuss what steps can be taken to provide consumer protections related to the surrender of these products. Mr. Weber said the goal is to have requirements developed by the end of the year.

2. **Exposed Amendment Proposal 2019-34**

Mr. Robinson continued the discussion of amendment proposal 2019-34. He said two considerations for the Task Force are the challenges of trying to regulate business reinsured by offshore companies and the need to assess some business on a standalone basis. He said if the amendment proposal is exposed for comment, commenters will be asked to provide references to formal guidance that supports the notion that the company that bears the risk should be responsible for asset adequacy testing. Mr. Serbinowski discussed his comment letter (Attachment A). He said it would be difficult for the reinsurer to provide standalone asset adequacy testing to a ceding company because that business is aggregated with the business of other cedants. He said for modified coinsurance (mod-co) or funds withheld reinsurance agreements, he supports having the company holding the assets perform the asset adequacy testing. Mr. Robinson clarified that the amendment proposal is intended to address all forms of reinsurance. Mr. Sartain asked if the requirements address the responsibility of the appointed actuary for assessing credit risk. Mr. Robinson indicated that he is not aware of any such requirements. Mr. Andersen said historically, the Actuarial Standards of Practice (ASOPs) were relied upon to provide guidance on such issues. Mr. Sartain said it makes sense to have the reinsurer be responsible to perform asset adequacy testing on the business it assumes. He noted that the ceding company responsibility should increase as the credit risk grows. Ms. Fenwick said the New York State Department of Financial Services (NYSDFS) has taken the position that the ceding company retains responsibility for reinsured business and is required to do the asset adequacy testing on a gross basis without the benefit of aggregation. Leonard Mangini (American Academy of Actuaries—Academy) stressed the necessity for amendment proposal 2019-34. He said the revised ASOP 11, which will be effective for year-end 2022, requires the appointed actuary to look at all reinsurance related risks, not just credit risks.

Mr. Andersen made a motion, seconded by Mr. Yanacheak, to expose amendment proposal 2019-34 (Attachment B) for a 30-day public comment period ending June 14. The motion passed, with Mr. Sartain opposing.

3. **Exposed Amendment Proposal 2021-08**

Larry Bruning (Society of Actuaries—SOA) said the SOA Valuation Basic Table (VBT) Team Subgroup would like to reduce the time for gathering mortality experience used to determine whether the VBT should be updated. He said amendment proposal...
2021-08 shortens the lag between the reporting year and observation year for mortality experience from a two-year lag to a one-year lag and makes appropriate adjustments for the initial reporting year in which the amendment proposal is effective.

Mr. Carmello made a motion, seconded by Mr. Yanacheak, to expose amendment proposal 2021-08 (Attachment C) for a 21-day public comment period ending June 4. The motion passed unanimously.

Having no further business, the Life Actuarial (A) Task Force adjourned.
Thoughts from Tomasz Serbinowski on APF 2019-34

I'd like to share some thoughts on the APF. First let me say that I like the idea of clarifying responsibilities of the appointed actuaries with respect to reinsurance ceded. My interest is however more related to asset adequacy testing when the company retains the assets (ModCo and Funds Withheld treaties).

With respect to the specific proposal here are my concerns.

1. The rationale for the proposal states that "where the appointed actuary can rely on work performed by the counterparty's appointed actuary [...] this APF will require the appointed actuary to provide the results of the asset adequacy analysis, as evidence that the analysis was performed."

Given that the reinsurer is allowed to aggregate blocks assumed under numerous treaties, it may be challenging to provide results of the asset adequacy analysis with respect to a specific block.

2. The proposal appears to concentrate on reinsurance where the reserve for the ceded business is established by the reinsurer and where the assets supporting that reserve are held by the reinsurer. However, especially in situations when the reinsurer is unauthorized, captive, or an offshore company, the funds supporting the reserve may be in possession of the direct writer. Holding the assets supporting the reserve alleviates credit risk. However, it does not remedy any potential asset adequacy deficiencies.

That is, if the assets were insufficient for the liability prior to the reinsurance, they remain insufficient with the reinsurance in place. However, any insufficiency can only be detected through asset adequacy analysis.

I would welcome an amendment to the APF that would explicitly require asset adequacy testing of any reserves ceded under the arrangements where the assets supporting reserve are held by the direct writer, including ModCo and Funds Withheld treaties.

Sincerely,

Tomasz Serbinowski
Life Actuarial (A) Task Force/ Health Actuarial (B) Task Force
Amendment Proposal Form*

1. Identify yourself, your affiliation and a very brief description (title) of the issue.

John Robinson, Director PBR – Valuation Actuary, MN

2. Identify the document, including the date if the document is “released for comment,” and the location in the document where the amendment is proposed:

3. Show what changes are needed by providing a red-line version of the original verbiage with deletions and identify the verbiage to be deleted, inserted or changed by providing a red-line (turn on “track changes” in Word®) version of the verbiage. (You may do this through an attachment.)

4. State the reason for the proposed amendment? (You may do this through an attachment.)

The purposes of this APF are to
(a) Clarify the responsibilities of the appointed actuaries of both the ceding and assuming companies for all forms of reinsurance, relative to both the SAO and asset adequacy analysis.

(b) Make a minor modification to the table headings in VM-30, Section 3.A.5.

Discussion of Rationale:

1. Every appointed actuary should be held accountable for ensuring that all the reserves covered by the actuary’s SAO are subjected to asset adequacy analysis. Usually, this requires the appointed actuary to perform the analysis; however, circumstances may exist where the appointed actuary can rely on work performed by the counterparty’s appointed actuary. In any event, whether relying on another actuary or not, this APF will require the appointed actuary to provide the results of the asset adequacy analysis, as evidence that the analysis was performed.

2. VM-30 Section 3.A.7.e includes the following required statement as part of the SAO:
“The reserves and related actuarial items, when considered in light of the assets held by the company with respect to such reserves and related actuarial items including, but not limited to, the investment earnings on the assets, and the considerations anticipated to be received and retained under the policies and contracts, make adequate provision, according to presently accepted ASOPs, for the anticipated cash flows required by the contractual obligations and related expenses of the company.”

In a situation where part or all of the risk is reinsured, the assets held by the company may only be in respect of the portion of the risk supported by the reserves held; however, the appointed actuary’s actuarial opinion must address all the contractual obligations. It follows that, while asset adequacy analysis can only be performed on the reserves and assets held (i.e. net of reinsurance), the appointed actuary’s responsibility may extend beyond the reserves and assets held.
3. In a recent Academy survey of appointed actuaries ("A Survey of Life Appointed Actuaries, December 4, 2020", Question 66), most of them (50.38%) indicated that for the YE2019 AAT, “no special consideration for reinsurance recoverability will be added”.

This APF will provide guidance that should produce more clarity and uniformity on this issue.

4. The following excerpt is from ASOP 7, “Analysis of Life, Health, or Property/Casualty Insurer Cash Flows”:

3.8 Reinsurance—The actuary should consider whether reinsurance receivables will be collectible when due, and any terms, conditions, or other aspects that may be reasonably expected to have a material impact on the cash flow analysis.”

This APF will propose that similar guidance apply to the appointed actuary in meeting his/her responsibility beyond the reserves and assets held.

The proposed text is in the Appendix below.

* This form is not intended for minor corrections, such as formatting, grammar, cross-references or spelling. Those types of changes do not require action by the entire group and may be submitted via letter or email to the NAIC staff support person for the NAIC group where the document originated.

Notes: VM Maintenance Agenda 2019-34
APPENDIX

1. It is proposed to add the following text as VM-30, Section 4:

Section 4: Asset Adequacy Analysis For Treaties Of Reinsurance

1. Each counterparty to a reinsurance treaty has established a reserve in respect of its obligations relative to the underlying policies. Furthermore, the appointed actuary’s statement of actuarial opinion covers the reserves established for all of the company’s reinsurance treaties currently in force. Consequently, a company’s appointed actuary is required to perform adequacy analysis on the reserves which the company has established in respect of the treaties into which the company has entered and which are currently in force.

2. The results of the asset adequacy analysis shall be reported in the appointed actuary’s actuarial memorandum, as required in Section 3.B.12.b.

3. Materiality considerations may influence the decision whether to perform the asset adequacy analysis. However, the size of the reserve must not be the sole materiality criterion.

4. The appointed actuary of a direct writer must perform a review of each reinsurance counterparty to assess
   (a) whether reinsurance receivables will be collectible when due; and
   (b) any terms, conditions, or other aspects that may be reasonably expected to have a material impact on the company’s ability to meet its obligations to policyholders.

Evidence of having performed such reviews shall be provided in the actuarial memorandum.

Guidance Note:
(a) Under certain circumstances, for example, when risk is ceded under a modified coinsurance agreement, a counterparty may report a reserve of 0. This alone does not foreclose on the requirement for the asset adequacy analysis to be performed.
(b) If an appointed actuary relies on the work of another actuary, such as the appointed actuary of the reinsurance counterparty, the guidance in Section 3.A.6 and Section 3.B.2 must be followed. In relying on the work of another appointed actuary, an appointed actuary may not rely solely on the other actuary’s statement of actuarial opinion.

[Underlying principles:
1. The SAO itself
2. Each counterparty has its own perspective
3. Regulatory accountability]

Question for commenters:
In 4., should there be more specificity as to what evidence should be provided?
If so, what should be required?
2. Revision to Section 3.A.5, Table Headings:

<table>
<thead>
<tr>
<th>Statement Item</th>
<th>Formula Reserves (1)</th>
<th>Principle-Based Reserves (2)</th>
<th>Additional Reserves * (3)</th>
<th>Analysis Method b</th>
<th>Other Amount Not Tested (4)</th>
<th>Total Amount = (1)+(2)+(3)+(4) (5)</th>
</tr>
</thead>
</table>

Life Actuarial (A) Task Force/ Health Actuarial (B) Task Force

Amendment Proposal Form*

1. Identify yourself, your affiliation and a very brief description (title) of the issue.

Society of Actuaries Valuation Basic Table Team – Chair Larry Bruning

Revisions to VM-51 to allow for the data experience reporting observation calendar year to be one year prior to the reporting calendar year.

2. Identify the document, including the date if the document is “released for comment,” and the location in the document where the amendment is proposed:

3. Show what changes are needed by providing a red-line version of the original verbiage with deletions and identify the verbiage to be deleted, inserted or changed by providing a red-line (turn on “track changes” in Word®) version of the verbiage. (You may do this through an attachment.)

Section 2: Statistical Plan for Mortality

D. Process for Submitting Experience Data Under This Statistical Plan

Data for this statistical plan for mortality shall be submitted on an annual basis. Each company required to submit this data shall submit the data using the Regulatory Data Collection (RDC) online software submission application developed by the Experience Reporting Agent. For each data file submitted by a company, the Experience Reporting Agent will perform reasonability and completeness checks, as defined in Section 4 of VM-50, on the data. The Experience Reporting Agent will notify the company within 30 days following the data submission of any possible errors that need to be corrected. The Experience Reporting Agent will compile and send a report listing potential errors that need correction to the company.

Data for this statistical plan for mortality will be compiled using a calendar year method. The reporting calendar year is the calendar year that the company submits the experience data. The observation calendar year is the calendar year of the experience data that is reported. The observation calendar year will be one year prior to the reporting calendar year. For example, if the current calendar year is 2022 and that is the reporting calendar year, the company is to report the experience data that was in-force or issued in calendar year 2021, which is the observation calendar year.

For the 2022 reporting calendar year, companies that are required to submit data for this statistical plan for mortality will be required to submit two observation calendar years of data, namely observation calendar year 2020 and observation calendar year 2021. For reporting calendar years after 2022, companies that are required to submit data for this statistical plan for mortality will be required to submit one observation calendar year of data.

Given an observation calendar year of 20XX, the calendar year method requires reporting of experience data as follows:

i. Report policies in force during or issued during calendar year 20XX.
ii. Report terminations that were incurred in calendar year 20XX and reported before July 1, 20XX+1. However, exclude rescinded policies (e.g., 10-day free look exercises) from the data submission.

For any reporting calendar year, the data call will occur during July of that reporting calendar year, and data is to be submitted according to the requirements of the Valuation Manual in effect during that calendar year. For the 2022 reporting calendar year, the requirements of the 2022 Valuation Manual will be used for both the 2020 and 2021 observation years. Data submissions must be made by Sept. 30 of the reporting calendar year. Corrections of data submissions must be completed by Dec. 31 of the reporting calendar year.

4. State the reason for the proposed amendment? (You may do this through an attachment.)

This APF is needed for the following reasons:

1. There is a need to shorten the time period between data observation and data collection to facilitate more timely analysis and reporting of mortality experience.
2. Under a Principle Based Reserving methodology, valuation basic tables should reflect recent and current mortality experience.
The Life Actuarial (A) Task Force met May 6, 2021. The following Task Force members participated: Doug Slape, Chair, represented by Mike Boerner and Rachel Hemphill (TX); Judith L. French, Vice Chair, represented by Peter Weber (OH); Lori K. Wing-Heier represented by Sharon Comstock (AK); Jim L. Ridling represented by Jennifer Li and Steve Ostlund (AL); Ricardo Lara represented by Ben Bock and Perry Kupferman (CA); Michael Conway represented by Eric Unger (CO); Andrew N. Mais represented by Wanchin Chou (CT); Doug Ommen represented by Mike Yanacheak (IA); Dana Popish Seversinghaus represented by Bruce Sartain and Vincent Tsang (IL); Vicki Schmidt represented by Nicole Boyd (KS); Grace Arnold represented by Fred Andersen and John Robinson (MN); Chlora Lindley-Myers represented by William Leung (MO); Eric Dunning represented by Rhonda Ahrens (NE); Marlene Caride represented by Kevin Clarkson (NJ); Linda A. Lacewell represented by Bill Carmello and Amanda Fenwick (NY); Glen Mulready represented by Andrew Schallhorn (OK); Jonathan T. Pike represented by Tomasz Serbinski (UT); Scott A. White represented by Craig Chupp (VA); and James A. Dodrill represented by Tim Sigman and Joylynn Fix (WV).

1. Re-Exposed Amendment Proposal 2019-33

Mary Bahna-Nolan (American Academy of Actuaries—Academy) continued the discussion of amendment proposal 2019-33 from the Task Force’s April 29 meeting. She noted that the amendment proposal was updated to include principle-based reserving (PBR) exemption language from the previously adopted amendment proposal 2020-11.

Mr. Weber made a motion, seconded by Mr. Andersen, to expose amendment proposal 2019-33 (Attachment A) for a 30-day public comment period ending June 7. The motion passed unanimously.

2. Adopted Amendment Proposal 2021-03

Connie Tang (Academy) said amendment proposal 2021-03 updates Section 6 of VM-21, Requirements for Principle-Based Reserves for Variable Annuities, to reflect the increase of the required minimum distribution (RMD) age from 70½ to 72. She said a guidance note was added to clarify that changes in the RMD age may require recalculation of the cohort weighting.

Mr. Weber made a motion, seconded by Mr. Knable, to adopt amendment proposal 2021-03 (Attachment B). The motion passed unanimously.

3. Exposed Amendment Proposal 2021-07

David Neve (Actuarial Resources Corporation of Georgia) said amendment proposal 2021-07 clarifies the universal life policies with secondary guarantees (ULSG) net premium reserve (NPR) calculation requirements. He said the amendment proposal reorganizes Section 3.B.5 and Section 3.B.6 of VM-20, Requirements for Principle-Based Reserves for Life Products, into a single Section 3.B.5. He stressed that no requirement changes result from the reorganization. Mr. Chupp identified several references that required updates. He agreed to work with Mr. Neve to make the changes prior to exposure.

Mr. Chupp made a motion, seconded by Mr. Weber, to expose amendment proposal 2021-07 (Attachment C), including the changes identified by Mr. Chupp, for a 40-day public comment period ending June 14. The motion passed unanimously.

4. Discussed Amendment Proposal 2019-34

Mr. Robinson said amendment proposal 2019-34 (Attachment D) initially targeted reporting for modified coinsurance (mod-co) agreements. He said the amendment proposal was expanded to address reinsurance in general. He said the amendment proposal addresses the responsibilities of the appointed actuary for reinsured business. Brian Bayerle (American Council of Life Insurers—ACLI) suggested an ACLI-provided education session for the Task Force before exposing the amendment proposal for comment.

Having no further business, the Life Actuarial (A) Task Force adjourned.
1. Identify yourself, your affiliation and a very brief description (title) of the issue.

American Academy of Actuaries, Life Reserves Work Group

Addition of language to clarify the definition of individually underwritten life insurance and the applicability of Principle-Based Reserve (PBR) requirements for group insurance contracts with individual risk selection issued under insurance certificates.

2. Identify the document, including the date if the document is “released for comment,” and the location in the document where the amendment is proposed:

January 1, 2021, version of the Valuation Manual, with the revisions to APF 2020-11 (adopted by LATF on 2/11/21) shown in blue text.

3. Show what changes are needed by providing a red-line version of the original verbiage with deletions and identify the verbiage to be deleted, inserted or changed by providing a red-line (turn on “track changes” in Word®) version of the verbiage. (You may do this through an attachment.)

See Appendix

All proposed changes specific to this amendment proposal are shown in red text.

4. State the reason for the proposed amendment? (You may do this through an attachment.)

Individual insurance certificates issued under a group contract which utilize an individual risk selection process, pricing, premium rate structures and product features are similar to individual life insurance policies. They are currently excluded from VM-20 because they are filed under a group contract, but they should be subject to VM-20 due to this similarity. See Appendix.

* This form is not intended for minor corrections, such as formatting, grammar, cross-references or spelling. Those types of changes do not require action by the entire group and may be submitted via letter or email to the NAIC staff support person for the NAIC group where the document originated.

Notes: APF 2019-33
Appendix

Issue

Certain contracts issued under a master group contract require individual risk selection in order to qualify for issuance of the group insurance certificate; the certificates have similar acquisition approaches, provisions, certificate-holder rights, pricing, and risk classification; and they are managed in a similar manner as individual ordinary life insurance contracts. These individual certificates should follow the same reserve requirements as other individual life contracts of the same product type. Therefore, a change is needed within the Valuation Manual to bring these individual certificates into scope of VM-20.

Six changes are recommended:

1) Within the Reserve Requirements section (Section II), change the minimum reserve requirements to also apply to group life contracts which, other than the difference between issuing a policy and issuing a group certificate, have the same or mostly similar contract provisions, risk selection process, and underwriting as individual ordinary life contracts (Section II, subsection 1.D);

2) Within the Reserve Requirements section (Section II), add a transition period for individual group certificates issued on or before 1/1/2024 (Section II, subsections 1.F.1 and 1.F.2);

3) Within the Reserve Requirements section (Section II), add language and guidance note to subsection 1.G and the corresponding footnote to include premiums from group life contracts which have individual certificates that were issued using individual risk selection processes (Section II, subsection 1.G.1, footnote, and guidance note) and to clarify the Calculation for Exemption (Section II, subsection 1.G.2). Comment notes need to refer to NAIC Blanks (E) Working Group to update the PBR Supplement;

4) Add new paragraph, VM-20 Section 1.B (and reformat to make current paragraph Section 1.A) to clarify group life certificates issued using individual risk selection processes, including a definition and requirements to be met, are subject to the requirements of VM-20;

5) Add guidance note after first sentence in VM-20 Section 2.A.1 that group life certificates that meet the definition for individual risk selection process use the same VM-20 Reserving Categories as defined in Section 2;

6) Draft referral to the NAIC Blanks (E) Working Group to revise the VM-20 Reserves Supplement, Part 2 to report premiums for total Group Life and Group Life with certificates subjected to an individual risk selection process and which meet all of the conditions as defined in VM-20 Section 1.B separately.
II. Reserve Requirements

This section provides the minimum reserve requirements by type of product, as set forth in the seven subsections below, as follows:

1. Life Insurance Products
2. Annuity Products
3. Deposit-Type Contracts
4. Health Insurance Products
5. Credit Life and Disability Products
6. Riders and Supplemental Benefits
7. Claim Reserves

All reserve requirements provided by this section relate to business issued on or after the operative date of the Valuation Manual. All reserves must be developed in a manner consistent with the requirements and concepts stated in the Overview of Reserve Concepts in Section I of the Valuation Manual.

**Guidance Note:** The terms “policies” and “contracts” are used interchangeably.

Subsection 1: Life Insurance Products

A. This subsection establishes reserve requirements for all contracts issued on and after the operative date of the Valuation Manual that are classified as life contracts as defined in SSAP No. 50 in the AP&P Manual, with the exception of annuity contracts and credit life contracts. Minimum reserve requirements for annuity contracts and credit life contracts are provided below in subsection 2 and subsection 5, respectively.

B. Minimum reserve requirements for variable and nonvariable individual life contracts—excluding guaranteed issue life contracts, preneed life contracts, industrial life contracts, and policies of companies exempt pursuant to the life PBR exemption in paragraph D below—subsection 1.G are provided by VM-20, Requirements for Principle-Based Reserves for Life Products, except for election of the transition period in paragraph C below subsection 1.F.2 below. For this purpose, joint life policies are considered individual life.

C. Minimum reserve requirements of VM-20 are considered principle-based valuation requirements for purposes of the Valuation Manual.

D. Minimum reserve requirements for individual certificates under group life contracts which meet all the requirements in VM-20 Section 1.B are provided by VM-20, except for election of the transition period in subsection 1.F.1 below.

E. Minimum reserve requirements for life contracts not subject to VM-20 are those pursuant to applicable requirements in VM-A and VM-C. For guaranteed issue life contracts issued after Dec. 31, 2018, mortality tables are defined in VM Appendix M, Mortality Tables (VM-M), and the same table shall be used for reserve requirements as is used for minimum nonforfeiture requirements as defined in VM-02, Minimum Nonforfeiture Mortality and Interest.
F. A company may elect to establish minimum reserves pursuant to applicable requirements in VM-A and VM-C for:

1. Business described in subsection 1.D above and issued on or after the operative date of the Valuation Manual and prior to 1/1/2024.

2. Business not described subsection 1.D otherwise subject to VM-20 requirements and issued during the first three years following the operative date of the Valuation Manual.

A company electing to establish reserves using the requirements of VM-A and VM-C may elect to use the 2017 Commissioners’ Standard Ordinary (CSO) Tables as the mortality standard following the conditions outlined in VM-20 Section 3. If a company during the three years elects to apply VM-20 to a block of such business, then a company must continue to apply the requirements of VM-20 for future issues of this business.

G. Life PBR Exemption

1. A company meeting the at least one of the conditions in Dsubsection 1.G.2 below may file a statement of exemption for individual ordinary life insurance policies and certificates, except for policies in Dsubsection 1.G.3 below, issued directly or assumed during the current calendar year, that would otherwise be subject to VM-20. If a company has no business issued directly or assumed during the current calendar year that would otherwise be subject to VM-20, a statement of exemption is not required. For a filed statement of exemption, the statement must be filed with the domiciliary commissioner prior to July 1 of that year certifying that at least one of the two conditions in Dsubsection 1.G.2 was met and the statement of exemption must also be included with the NAIC filing for the second quarter of that year.

The domiciliary commissioner may reject such statement prior to September 1 and require the company to follow the requirements of VM-20 for the ordinary life policies covered by the statement.

If a filed statement of exemption is not rejected by the domiciliary commissioner, the filing of subsequent statements of exemption is not required as long as the company continues to qualify for the exemption; rather, ongoing statements of exemption for each new calendar year will be deemed to not be rejected, unless: 1) the company does not meet either condition in Dsubsection 1.G.2 below, 2) the policies contain those in Dsubsection 1.G.3 below, or 3) the domiciliary commissioner contacts the company prior to Sept. 1 and notifies them that the statement of exemption is rejected. If any of these three events occur, then the statement of exemption for the current calendar year is rejected and a new statement of exemption must be filed and not rejected in order for the company to exempt additional policies. In the case of an ongoing statement of exemption, rather than include a statement of exemption with the NAIC filing for the second quarter of that year, the company should enter “SEE EXPLANATION” in response to the Life PBR Exemption supplemental interrogatory and provide as an explanation that the company is utilizing an ongoing statement of exemption.

2. Condition for Exemption:

a. The company has less than $300 million of ordinary life exemption premiums, and if the company is a member of an NAIC group of life insurers which includes other life insurance companies, the group has combined ordinary life exemption premiums of less than $600 million.

The only new policies that would otherwise be subject to VM-20 being issued or assumed by the company are due to election of policy benefits or features from existing policies valued under VM-A and VM-C and the company was exempted from, or otherwise not subject to, the requirements of VM-20 in the prior year.

Exemption premium is determined as follows:
a. The amount reported in the prior calendar year life/health annual statement, Exhibit 1, Part 1, Column 3 (“Ordinary Life Insurance”), line 20.1; plus

b. The portion of the amount in the prior calendar year life/health annual statement, Exhibit 1, Part 1, Column 3 (“Ordinary Life Insurance”), line 20.2 assumed from unaffiliated companies; minus

c. Amounts included in either (a) or (b) that are associated with guaranteed issue insurance policies and/or preneed life insurance policies; minus

d. Amounts included in either (a) or (b) that represent transfers of reserves in force as of the effective date of a reinsurance assumed transaction; plus

e. Amounts of premium for individual life certificates issued under a group life certificate which meet the conditions defined in VM-20, Section 1.B, and that are not included in either (a) or (b).

Guidance Note:
(i) Definitions of preneed and guaranteed issue insurance policy are in VM-01.
(ii) For statements of exemption filed for calendar year 2022 and beyond, the amount in subsection 2.e was reported in the prior calendar year life/health annual statement, VM-20 Reserve Supplement, Part 2, if applicable.

3. Policies Excluded from the Life PBR Exemption:

a. Universal life with secondary guarantee (ULSG) policies, or policies – other than ULSG – that contain a rider with a secondary guarantee, in which the secondary guarantee does not meet the VM-01 definition of a “non-material secondary guarantee.”

4. Each exemption, or lack of an exemption, outlined in D. subsection 1.G.1 – D. subsection 1.G.3 above applies only to policies issued or assumed in the current year, and it applies to all future valuation dates for those policies. However, if policies did not qualify for the Life PBR Exemption during the year of issue but would have qualified for the Life PBR Exemption if the current Valuation Manual requirements had been in effect during the year of issue, then the domiciliary commissioner may allow an exemption for such policies. The minimum reserve requirements for the ordinary life policies subject to the exemption are those pursuant to applicable methods required in VM-A and VM-C using the mortality as defined in VM-20 Section 3.C.1 and VM-M Section 1.H.

VM Change 4 – VM-20: Requirements for Principle-Based Reserves for Life Products

VM-20: Requirements for Principles-Based Reserves for Life Products

Section 1: Purpose

A. These requirements establish the minimum reserve valuation standard for individual life insurance policies issued on or after the operative date of the Valuation Manual and subject to a principle-based valuation with an NPR floor under Model #820. These requirements constitute the Commissioners Reserve Valuation Method (CRVM) for policies of individual life insurance.
VM Change 5 - VM-20: Requirements for Principle-Based Reserves for Life Products

Section 2: Minimum Reserve

B. Individual life certificates under a group life contract shall be subject to the requirements of VM-20 if all of the following are met. These requirements constitute the Commissioners Reserve Valuation Method (CRVM) for such certificates.

1. An individual risk selection process, defined as follows, is used to obtain group life insurance coverage;

   An individual risk selection process is one that is based on characteristics of the insured(s) beyond sex, gender, age, tobacco usage, and membership in a particular group. This may include, but is not limited to, completion of an application (beyond acknowledgement of membership to the group, sex, gender and age), questionnaire(s), online health history or tele-interview to obtain non-medical and medical or health history information, prescription history information, avocations, usage of tobacco, family history, or submission of fluids such as blood, Home Office Specimens (HOS), or oral fluid. The resulting risk classification is determined based on the characteristics of the individual insured(s) rather than the group, if any, of which it is a member (e.g., employer, affinity, etc.). The individual certificate holder is charged a premium rate based solely on the individual risk selection process and not on membership in a specific group.

   **Guidance Note:** The use of evidence of insurability does not by itself constitute an individual risk selection process. Use of information obtained from a census or question(s) regarding gender, occupation, age, income and/or tobacco usage solely for purposes of determining a rate classification does not by itself qualify a group as having used an individual risk selection process. Group insurance where the underwriting based on the characteristics of the group and census data but where some individuals are subjected to individual risk selection as a result of compensation level, age, an existing medical condition or impairment, late entry into the group, failure of the group to meet minimum participation requirements or voluntary buy-up of increased coverage does not meet the definition of an individual risk selection process.

2. The individual certificates utilize premiums or cost of insurance schedules and charges based on the individual applicant’s issue age, duration from underwriting, coverage amount and risk classification and there is a stated or implied schedule of maximum gross premiums or net cash surrender value required in order to continue coverage in force for a period in excess of one year;

3. The group master contract is designed, priced, solicited, and managed similar to individual ordinary life insurance policies rather than specific to the group as a whole;

4. The individual certificates have similar acquisition approaches, provisions, certificate-holder rights, pricing, and risk classification to individual ordinary life insurance contracts.

5. The individual certificates are issued on or after the operative date of the Valuation Manual except election of the transition period in Section 2, subsection 1.F.1.
A. All policies subject to these requirements shall be included in one of the VM-20 Reserving Categories, as specified in Section 2.A.1, Section 2.A.2 and Section 2.A.3 below.

**Guidance Note:** Since group insurance subject to an individual risk selection process and meeting all the requirements in Section 1.B is subject to VM-20 requirements, Section 2.A shall apply—meaning that any such contracts will be included in one of the VM-20 Reserving Categories defined by Section 2.A.1, Section 2.A.2, and 2.A.3. All requirements in VM-31 which apply to a VM-20 Reserving Category shall apply to any group insurance subject to individual risk selection that has been included in that VM-20 Reserving Category.

The company may elect to exclude one or more groups of policies from the stochastic reserve calculation and/or the deterministic reserve calculation. When excluding a group of policies from a reserve calculation, the company must document that the applicable exclusion test defined in Section 6 is passed for that group of policies. The minimum reserve for each VM-20 Reserving Category is defined by Section 2.A.1, Section 2.A.2 and Section 2.A.3, and the total minimum reserve equals the sum of the Section 2.A.1, Section 2.A.2 and Section 2.A.3 results below, defined as:
VM Change 6 – VM-20 Reserves Supplement, Part 2: Life PBR Exemption

Refer to NAIC Blanks (E) Working Group, request for modification to the supplemental report for the Life PBR Exemption, to show the premiums for group life that utilized an individual risk selection process and meets all of the requirements in VM-20 Section 1.B. as these premiums are currently grouped together with other group insurance in Exhibit 1. As there are other instances where the ordinary life premiums are not included in the determination of the Life PBR Exemption (e.g., for guaranteed issue policies), it may be useful to request addition of the breakdown of premiums used to determine the exemption.

Possible insertion between questions 1 and 2 for disclosure of premiums used in the determination of eligibility for the Life PBR exemption, split by ordinary life and group subject to an individual risk selection process and meeting all of the requirements in VM-20 Section 1.B.
Life Actuarial (A) Task Force
Amendment Proposal Form 2021-03
Exposed for a 21-day public comment period ending May 3, 2021

The proposed guidance note presumes that Section 6.C.5.n refers to how cohorts and weights are unaffected by changes in interest rates at each reporting date because the discount rate for the calculations is fixed, but it indicates that periodic updates to underlying prescribed assumptions may require recalculations. LATF is requesting comments on this interpretation and its applicability to this RMD change vs. Standard Projection assumption updates more broadly.

Please submit comments to Reggie Mazyck (RMazyck@naic.org) by COB 5/3/21.
Life Actuarial (A) Task Force/ Health Actuarial (B) Task Force
Amendment Proposal Form*

1. Identify yourself, your affiliation and a very brief description (title) of the issue.

American Academy of Actuaries, Variable Annuity Reserves & Capital Work Group

Update the reference to the required minimum distribution (RMD) age in the VM-21 Standard Projection Amount for the Setting Every Community Up for Retirement Enhancement (SECURE) Act change.

2. Identify the document, including the date if the document is “released for comment,” and the location in the document where the amendment is proposed:

January 1, 2021, version of the Valuation Manual

3. Show what changes are needed by providing a red-line version of the original verbiage with deletions and identify the verbiage to be deleted, inserted or changed by providing a red-line (turn on “track changes” in Word®) version of the verbiage. (You may do this through an attachment.)

In VM-21, Section 6.C.5:

i. For tax-qualified contracts, add the following to the revised GAPV^2 corresponding to an initial withdrawal age of the federal required minimum distribution (RMD) age.

\[
0.50 \times \left( \frac{0.95 - \sum_{i=\text{Issue Age}}^{\text{Initl WD Age}} \text{GAPV}_{\text{Adj, Scaled}}^2, \text{if contract is a tax-qualified GMWB}}{0.65 - \sum_{i=\text{Issue Age}}^{\text{Initl WD Age}} \text{GAPV}_{\text{Adj, Scaled}}^2, \text{if contract is a tax-qualified hybrid GMIB}} \right) \]

j. Scale the revised GAPV^2 values at all future initial withdrawal ages—i.e., all ages greater than the federal required minimum distribution (RMD) age, as identified in the preceding step—such that the sum of the revised GAPV^2 values equals 0.95 for tax-qualified GMWB contracts and 0.85 for tax-qualified hybrid GMIB contracts again.

n. The cohorts and their associated weights as determined in Section 6.C.5.a through Section 6.C.5.k are for a contract with attained age equal to its issue age. Because the discount rate used in this determination is fixed, generally these calculations only need to be performed once for a given set of contracts with a certain issue age, guaranteed benefit product, and tax status.

Guidance Note: Cohorts and their associated weights may need to be revised if prescribed assumptions are updated.
4. State the reason for the proposed amendment? (You may do this through an attachment.)

The Standard Projection’s withdrawal delay cohort method includes an adjustment at the required minimum distribution (RMD) age. The SECURE Act changed the RMD age from 70.5 to 72. This proposed amendment implements the change by directly referencing the RMD age. The direct reference will reduce Valuation Manual maintenance for any future changes.

The proposed guidance note presumes that Section 6.C.5.n refers to how cohorts and weights are unaffected by changes in interest rates at each reporting date because the discount rate for the calculations is fixed, but it indicates that periodic updates to underlying prescribed assumptions may require recalculations. LATF is requesting comments on this interpretation and its applicability to this RMD change vs. Standard Projection assumption updates more broadly.

* This form is not intended for minor corrections, such as formatting, grammar, cross-references or spelling. Those types of changes do not require action by the entire group and may be submitted via letter or email to the NAIC staff support person for the NAIC group where the document originated.

Amendment Proposal Form*

1. Identify yourself, your affiliation and a very brief description (title) of the issue.

Identification: David Neve, VP and Consulting Actuary, Actuarial Resources Corporation of GA
Title of the Issue: Clarify ULSG NPR calculation requirements

2. Identify the document, including the date if the document is “released for comment,” and the location in the document where the amendment is proposed:

January 1, 2021 NAIC Valuation Manual, but incorporating APF 2020-03
Section 2.A.3, Section 3. B.1, 2, 5 and 6, Section 6.B.5.b

Section 3.A, Section 3.C.2 and 3

3. Show what changes are needed by providing a red-line version of the original verbiage with deletions and identify the verbiage to be deleted, inserted or changed by providing a red-line (turn on “track changes” in Word®) version of the verbiage. (You may do this through an attachment.)

See attached.

As a general overview, Section 3.B.5 stayed in 3.B.5 but was renumbered, but Section 3.B.6 was moved to 3.B.5.b and c.

Below is a detailed summary of the items that were moved to a new section (and/or renumbered) but were not redlined. In some cases, the wording was redlined after it was moved (if the wording changed).

4. State the reason for the proposed amendment? (You may do this through an attachment.)

The NPR calculation requirements for ULSG products are currently contained in Section 3.B.5 and 3.B.6 of the Valuation Manual. The current wording takes the reader back and forth between Section 3.B.5 and 3.B.6 when trying to follow the reserve calculation for ULSG products, which can be confusing. And the current wording also has led some people to incorrectly interpret Section 3.B.5 to be applicable to UL products without a SG.

The APF combines the current 3.B.5 and 3.B.6 sections into a single section labeled 3.B.5 and clarifies how to determine the NPR when the policy duration at the valuation date is either prior to, or after the SG has expired. Importantly, no change has been made to the current requirements, only the formatting of the requirements to make them easier to follow. Note that the new wording has flipped the order of the old 3.B.5 and 3.B.6 when combining them in the new 3.B.5, but this movement is not shown as a tracked change (since no changes were made to the existing reserve calculation requirements in the two sections).

Section 3.A has also been revised to eliminate the confusion that can arise on whether the NPR for products in the All Other VM-20 Reserving Category is still a VM-20 reserve. The NPR requirement for products in the All Other VM-20 Reserving Category has been moved to Section 3.B.6.

Impacted references have been updated.
ATTACHMENT

Section 2: Minimum Reserve

A. All policies subject to these requirements shall be included in one of the VM-20 Reserving Categories, as specified in Section 2.A.1, Section 2.A.2 and Section 2.A.3 below.

1. Term Reserving Category
2. ULSG Reserving Category
3. All Other VM-20 Reserving Category – All policies and riders belonging to the All Other VM-20 Reserving Category are to be included in Section 2.A.3.c unless the company has elected to exclude a group of them from the stochastic reserve calculation or both the deterministic and stochastic reserve calculations and has applied the applicable exclusion test defined in Section 6, passed the test and documented the results.

Section 3: Net Premium Reserve

A. Applicability

1. The NPR for each policy must be determined on a seriatim basis pursuant to Section 3.
2. When valuing term riders pursuant to Paragraph E in “Riders and Supplemental Benefits Requirements” in Section II, the reserve requirements for term policies are applicable.

B. NPR Calculation

1. For the purposes of Section 3, the following terms apply:
   d. The “level secondary guarantee” at any time is:
      i. For a shadow account secondary guarantee, the shadow account fund value that would have existed at that time assuming payment of the level gross premium determined according to Section 3.B.5.c.i.
      ii. For a cumulative premium secondary guarantee, the amount of cumulative level gross premiums determined according to Section 3.B.5.c.i.1. accumulated with any interest or accumulation factors per the contract provisions for the secondary guarantee.

2. Section 3.B.4 and Section 3.B.5 provide the calculation of a terminal NPR under the assumption of an annual mode gross premium. In Section 3.B.4 and Section 3.B.5, the gross premium referenced is the gross premium for the policy assuming an annual premium mode.

3. For all policies and riders within the Term Reserving Category, other than those addressed in Section 3.B.8 below, the NPR on any valuation date shall be equal to the actuarial present value of future benefits less the actuarial present value of future annual valuation net premiums as follows:

4. For all policies and riders within the ULSG Reserving Category, the NPR shall be determined as follows:
   a. If the policy duration on the valuation date is prior to the point when all secondary guarantee periods have expired, the NPR shall be the greater of the reserve amount determined in Section

Confidential

b. If the policy duration on the valuation date is after the expiration of all secondary guarantee periods, the NPR shall be the reserve amount determined according to Section 3.B.5.d only, subject to the floors specified in 3.D.2.

c. A reserve amount for the policy shall be calculated assuming the secondary guarantee is in effect as described below. If the policy has multiple secondary guarantees, the NPR shall be calculated as below for the secondary guarantee that provides the greatest NPR as of the valuation date. For the purposes of this subsection, let n be the longest number of years the policy can remain in force under the provisions of the secondary guarantee. However, if a shorter period produces a materially greater NPR, then n shall be that shorter number of years.

i. As of the policy issue date:

a) Determine the level gross premium at issue, assuming payments are made each year for which premiums are permitted to be paid, such period defined as v years in this subsection, that would keep the policy in force to the end of year n, based on policy provisions, including the secondary guarantee provisions, such as mortality, interest and expenses. In no event shall v be greater than n for purposes of the NPR calculated in this subsection.

b) Using the level gross premium from Section 3.B.5.c.i.a above, determine the value of the expense allowance components for the policy at issue as $x_1$, $y_{2-5}$ and $z_t$ defined below.

$x_1$: first-year expense equal to the level gross premium at issue

$y_{2-5}$: an expense equal to 10% of the level gross premium and applied in each year from the second through fifth policy year

$z_t$: a first-year expense of $2.50 per $1,000 of insurance issued

The expense allowance shall be amortized over the span of years in the secondary guarantee period during which premiums are permitted to be paid. $E_{x+t}$, the expense allowance balance as of the end of the policy year t, shall be computed as follows:

$$E_{x+t} = VNPR\cdot a_{x+t} + \left(\frac{x_1+z_t}{\delta_{x+t}}\right) + y_{2-5}\cdot C_{x+t}$$

for $t < v$

$= 0$ for $t \geq v$

Where:

$I = 1, 2, \ldots$ (number of completed years since issue)

$VNPR = \text{Valuation Net Premium Ratio from 3B.5.c.i.c}$

$C_{x+t} = 0$ when $t = 1$

$$\cdot \sum_{i=1}^{n-1} \left(1/d_{x+i|w^t}\right)$$

when $2 \leq t < 5$

$= C_{x+5}$ when $t \geq 5$

c) Determine the annual valuation net premiums at issue as that uniform percentage (the valuation net premium ratio) of the respective gross premiums such that at issue the...
actuarial present value of future valuation net premiums over the n-year period shall equal the actuarial present value of future benefits over the n-year period. The valuation net premium ratio determined shall not change for the policy.

ii. After the policy issue date, on each future valuation date, the NPR shall be determined as follows:

a) As of the valuation date for the policy being valued, determine the actual secondary guarantee, denoted $ASG_{x+t}$, as outlined in Section 3.B.1.c and the fully funded secondary guarantee, denoted $FFSG_{x+t}$, as outlined in Section 3.B.1.b.

b) Divide $ASG_{x+t}$ by $FFSG_{x+t}$, with the resulting ratio capped at 1. The ratio is intended to measure the level of prefunding for a secondary guarantee, which is used to establish reserves. Assumptions within the numerator and denominator of the ratio, therefore, must be consistent in order to appropriately reflect the level of prefunding. As used here, "assumptions" include any factor or value, whether assumed or known, which is used to calculate the numerator or denominator of the ratio.

c) Compute the net single premium ($NSP_{x+t}$) on the valuation date for the coverage provided by the secondary guarantee for the period of time ending at attained age $x+n$, using the interest, lapse and mortality assumptions prescribed in Section 3.C below. The net single premium (NSP) shall include consideration for death benefits only.

d) The NPR for an insured age $x$ at issue at time $t$ shall be according to the formula below:

$$M_{x+t} \left( \frac{ASG_{x+t}}{FFSG_{x+t}} \cdot 1 \right) \cdot NSP_{x+t} - E_{x+t}$$

**Guidance Note:** For a non-integer value of $t$, $E_{x+t}$ is obtained by taking the present value at duration $t$ of $E_{x+T}$, where $T$ is the next higher integer; i.e., entails discounting by valuation interest, mortality, and lapse for the fractional year between the valuation date and next anniversary ($T - t$).

iii. Actuarial present values referenced in this Section 3.B.5.d are calculated using the interest, mortality and lapse assumptions prescribed in Section 3.C below.

d. A reserve amount for the policy shall be calculated assuming the secondary guarantee is not in effect. The reserve amount shall be determined by the policy features and guarantees of the policy without considering any secondary guarantee provisions as follows:

i. Determine the level gross premium at issue, assuming payments are made each year for which premiums are permitted to be paid, such period defined as “s” in this subsection, that would keep the policy in force for the entire period coverage is to be provided based on the policy guarantees of mortality, interest and expenses.

ii. Using the level gross premium from Section 3.B.5.d.i, determine the value of the expense allowance components for the policy at issue as $x_1$, $y_{2-5}$ and $z_1$ defined below.

- $x_1$ = a first-year expense equal to the level gross premium at issue
- $y_{2-5}$ = an expense equal to 10% of the level gross premium and applied in each year from the second through fifth policy year
- $z_1$ = a first-year expense of $2.50 per $1,000 of insurance issued

© 2021 National Association of Insurance Commissioners
The expense allowance shall be amortized over the period during which premiums are permitted to be paid. \( E_{x+t} \), the expense allowance balance, as of the end of policy year \( t \), shall be calculated as follows:

\[
E_{x+t} = VNPR \cdot \bar{d}_{x+t} \cdot \left[ \frac{1}{\bar{a}_{x+5}} \right] \quad \text{for } t < s
\]

\[
= 0 \quad \text{for } t \geq s
\]

Where:

\( t = 1, 2, \ldots \) (number of completed years since issue)

\[ VNPR = \text{Valuation Net Premium Ratio from 3.B.5.d.iii} \]

\[ C_{x+t} = 0 \quad \text{when } t = 1 \]

\[ = \sum_{w=1}^{t-1} \frac{1}{\bar{a}_{x+t-w}} \quad \text{when } 2 \leq t \leq 5 \]

\[ = C_{x+5} \quad \text{when } t > 5 \]

iii. Determine the annual valuation net premiums as that uniform percentage (the valuation net premium ratio) of the respective gross premiums, such that at issue the actuarial present value of future valuation net premiums shall equal the actuarial present value of future benefits.

iv. For a policy issued at age \( x \), at any duration \( t \), the net premium reserve shall equal:

\[
m_{x+t} \cdot r_{x+t}
\]

Where:

a) \( m_{x+t} \) = the actuarial present value of future benefits less the actuarial present value of future valuation net premiums and less the unamortized expense allowance for the policy \( E_{x+t} \).

Guidance Note: For a non-integer value of \( t \), \( E_{x+t} \) is obtained by taking the present value at duration \( t \) of \( E_{x+T} \), where \( T \) is the next higher integer; i.e., entails discounting by valuation interest and survivorship for the fractional year between the valuation date and the next anniversary (\( T - t \)).

b) Let:

\[ e_{x+t} = \max \text{ (the actual policy fund value on the valuation date, 0)} \]

\[ f_{x+t} = \text{the policy fund value on the valuation date is that amount which, together with the payment of the future level gross premiums determined in Section 3.B.5.d.ii above, keeps the policy in force for the entire period coverage is to be provided, based on the policy guarantees of mortality, interest and expenses.} \]

Then set \( r_{x+t} \) equal to:

\[ 1, \text{ if } f_{x+t} \leq 0 \]

\[ \min[e_{x+t}/f_{x+t}], 1], \text{ otherwise} \]

v. The future benefits used in determining the value of \( m_{x+t} \) shall be based on the greater of \( e_{x+t} \) and \( f_{x+t} \), together with the future payment of the level gross premiums determined in Section 3.B.5.d.ii above, and assuming the policy guarantees of mortality, interest and expenses.
vi. The values of \( \bar{\sigma} \) are determined using the NPR interest, mortality and lapse assumptions applicable on the valuation date.

vii. Actuarial present values referenced in this Section 3.B.5.d are calculated using the interest, mortality and lapse assumptions prescribed in Section 3.C.

6. For all policies and riders within the All Other VM-20 Reserving Category, the NPR shall be determined pursuant to applicable methods in VM-A and VM-C for the basic reserve. The mortality tables to be used are those defined in Section 3.C.1 and in VM-M Section 1.H.

7. The actuarial present value of future benefits equals the present value of future benefits including, but not limited to, death, endowment (including endowments intermediate to the term of coverage) and cash surrender benefits. Future benefits are before reinsurance and before netting the repayment of any policy loans.

8. For life insurance coverage that the company has assumed on a YRT basis, the reinsurer’s net premium reserve shall be one half year’s cost of insurance for the reinsured net amount at risk.

C. Net Premium Reserve Assumptions

2. Interest Rates

b. For NPR amounts calculated according to Section 3.B.4 or Section 3.B.5.

3. Lapse Rates

c. For NPR amounts calculated according to Section 3.B.5 the lapse rate, \( L_{x+t} \), for an insured age \( x \) at issue for all durations subsequent to the valuation date shall be determined as follows:

i. Determine the ratio \( R_{x+t} \) where:

\[
R_{x+t} = \frac{[FFSG_{x+t} - ASG_{x+t}]}{[FFSG_{x+t} - LSG_{x+t}]} \quad \text{but not} \quad 1 \quad \text{and not} < 0
\]

Where:

- \( FFSG_{x+t} \) is the fully funded secondary guarantee on the valuation date for the insured age \( x \) at issue
- \( ASG_{x+t} \) is the actual secondary guarantee on the valuation date for the insured age \( x \) at issue
- \( LSG_{x+t} \) is the level secondary guarantee on the valuation date for the insured age \( x \) at issue

**Guidance Note:** The \( FFSG_{x+t} \), \( ASG_{x+t} \), and \( LSG_{x+t} \) are based on the secondary guarantee values as of the valuation date and will remain constant throughout the cash flow projection. This will result in a constant lapse assumption, calculated as of the valuation date, that does not vary by duration throughout the cash flow projection for the NPR calculation.

ii. As of the valuation date, which is \( t \) years after issue, the annual lapse rate for the policy shall be assumed to be level for all future years and denoted as \( L_{x+t} \), which shall be set equal to:

\[
L_{x+t} = R_{x+t} \times 0.01 + (1 - R_{x+t}) \times 0.005 \times r_{x+t}
\]
Where \( r_{x+t} \) is the ratio determined in Section 3.B.5.d.

**Guidance Note:** By similar logic, it follows (from ASG \( x + t \) being 0 when \( t = 0 \)) that the level annual lapse rate to be used in the calculations in Section 3.B.5.i.b and 3.B.5.i.c is 1%. On the other hand, when performing the calculations in Section 3.B.5.i.i, \( L_{x+t} \) though level, is not generally equal to what it was for the same policy on the previous valuation date.

### Section 6: Stochastic and Deterministic Exclusion Tests

**B. Deterministic Exclusion Test (DET)**

5. For purposes of determining the valuation net premiums used in the demonstration in Section 6.B.2:
   
a. If pursuant to Section 2, the NPR for the group of policies is the minimum reserve required under VM-A and VM-C, then the valuation net premiums are determined according to those minimum reserve requirements.

   b. If the NPR is determined according to Section 3.B.4 or Section 3.B.5, then the lapse rates assumed for all durations shall for the purposes of the DET be set to 0%;
Life Actuarial (A) Task Force/ Health Actuarial (B) Task Force
Amendment Proposal Form*

1. Identify yourself, your affiliation and a very brief description (title) of the issue.

John Robinson, Director PBR – Valuation Actuary, MN

2. Identify the document, including the date if the document is “released for comment,” and the location in the document where the amendment is proposed:

3. Show what changes are needed by providing a red-line version of the original verbiage with deletions and identify the verbiage to be deleted, inserted or changed by providing a red-line (turn on “track changes” in Word®) version of the verbiage. (You may do this through an attachment.)

4. State the reason for the proposed amendment? (You may do this through an attachment.)

The purposes of this APF are to
(a) Clarify the responsibilities of the appointed actuaries of both the ceding and assuming companies for all forms of reinsurance, relative to both the SAO and asset adequacy analysis.

(b) Make a minor modification to the table headings in VM-30, Section 3.A.5.

Discussion of Rationale:

1. Every appointed actuary should be held accountable for ensuring that all the reserves covered by the actuary’s SAO are subjected to asset adequacy analysis. Usually, this requires the appointed actuary to perform the analysis; however, circumstances may exist where the appointed actuary can rely on work performed by the counterparty’s appointed actuary. In any event, whether relying on another actuary or not, this APF will require the appointed actuary to provide the results of the asset adequacy analysis, as evidence that the analysis was performed.

2. VM-30 Section 3.A.7.e includes the following required statement as part of the SAO:
“The reserves and related actuarial items, when considered in light of the assets held by the company with respect to such reserves and related actuarial items including, but not limited to, the investment earnings on the assets, and the considerations anticipated to be received and retained under the policies and contracts, make adequate provision, according to presently accepted ASOPs, for the anticipated cash flows required by the contractual obligations and related expenses of the company.”

In a situation where part or all of the risk is reinsured, the assets held by the company may only be in respect of the portion of the risk supported by the reserves held; however, the appointed actuary’s actuarial opinion must address all the contractual obligations. It follows that, while asset adequacy analysis can only be performed on the reserves and assets held (i.e. net of reinsurance), the appointed actuary’s responsibility may extend beyond the reserves and assets held.
3. In a recent Academy survey of appointed actuaries ("A Survey of Life Appointed Actuaries, December 4, 2020", Question 66), most of them (50.38%) indicated that for the YE2019 AAT, “no special consideration for reinsurance recoverability will be added”.

This APF will provide guidance that should produce more clarity and uniformity on this issue.

4. The following excerpt is from ASOP 7, “Analysis of Life, Health, or Property/Casualty Insurer Cash Flows”:

3.8 Reinsurance—The actuary should consider whether reinsurance receivables will be collectible when due, and any terms, conditions, or other aspects that may be reasonably expected to have a material impact on the cash flow analysis.”

This APF will propose that similar guidance apply to the appointed actuary in meeting his/her responsibility beyond the reserves and assets held.

The proposed text is in the Appendix below.

* This form is not intended for minor corrections, such as formatting, grammar, cross-references or spelling. Those types of changes do not require action by the entire group and may be submitted via letter or email to the NAIC staff support person for the NAIC group where the document originated.

Notes: VM Maintenance Agenda 2019-34
1. It is proposed to add the following text as VM-30, Section 4:

Section 4: Asset Adequacy Analysis For Treaties Of Reinsurance

1. Each counterparty to a reinsurance treaty has established a reserve in respect of its obligations relative to the underlying policies. Furthermore, the appointed actuary’s statement of actuarial opinion covers the reserves established for all of the company’s reinsurance treaties currently in force. Consequently, a company’s appointed actuary is required to perform adequacy analysis on the reserves which the company has established in respect of the treaties into which the company has entered and which are currently in force.

2. The results of the asset adequacy analysis shall be reported in the appointed actuary’s actuarial memorandum, as required in Section 3.B.12.b.

3. Materiality considerations may influence the decision whether to perform the asset adequacy analysis. However, the size of the reserve must not be the sole materiality criterion.

4. The appointed actuary of a direct writer must perform a review of each reinsurance counterparty to assess
   (a) whether reinsurance receivables will be collectible when due; and
   (b) any terms, conditions, or other aspects that may be reasonably expected to have a material impact on the company’s ability to meet its obligations to policyholders.

   Evidence of having performed such reviews shall be provided in the actuarial memorandum.

Guidance Note:
   (a) Under certain circumstances, for example, when risk is ceded under a modified coinsurance agreement, a counterparty may report a reserve of 0. This alone does not foreclose on the requirement for the asset adequacy analysis to be performed.
   (b) If an appointed actuary relies on the work of another actuary, such as the appointed actuary of the reinsurance counterparty, the guidance in Section 3.A.6 and Section 3.B.2 must be followed. In relying on the work of another appointed actuary, an appointed actuary may not rely solely on the other actuary’s statement of actuarial opinion.

[Underlying principles:
   1. The SAO itself
   2. Each counterparty has its own perspective
   3. Regulatory accountability]

Question for commenters:
In 4., should there be more specificity as to what evidence should be provided?
If so, what should be required?
2. Revision to Section 3.A.5, Table Headings:

<table>

The Life Actuarial (A) Task Force met April 29, 2021. The following Task Force members participated: Doug Slape, Chair, represented by Mike Boerner and Rachel Hemphill (TX); Judith L. French, Vice Chair, represented by Peter Weber (OH); Lori K. Wing-Heier represented by Sharon Comstock (AK); Jim L. Ridling represented by Jennifer Li and Steve Ostlund (AL); Ricardo Lara represented by Ben Bock, Perry Kupferman and Thomas Reedy (CA); Michael Conway represented by Eric Unger (CO); Andrew N. Mais represented by Wanchin Chou (CT); Doug Ommen represented by Mike Yanacheak (IA); Dana Popish Severinghaus represented by Bruce Sartain and Vincent Tsang (IL); Stephen W. Robertson represented by Karl Knable (IN); Vicki Schmidt represented by Nicole Boyd (KS); Grace Arnold represented by Fred Andersen and John Robinson (MN); Chlora Lindley-Myers represented by William Leung (MO); Eric Dunning represented by Rhonda Ahrens (NE); Marlene Caride represented by Kevin Clarkson (NJ); Linda A. Lacewell represented by Bill Carmello and Amanda Fenwick (NY); Glen Mulready represented by Andrew Schallhorn (OK); Jonathan T. Pike represented by Tomasz Serbinowski (UT); and Scott A. White represented by Craig Chupp (VA).

1. **Adopted Amendment Proposal 2021-04**

   Brian Bayerle (American Council of Life Insurers—ACLI) said amendment proposal 2021-04 clarifies the references to Internal Revenue Code (IRC) Section 7702 in VM-02, Minimum Nonforfeiture Mortality and Interest.

   Mr. Leung made a motion, seconded by Mr. Weber, to adopt amendment proposal 2021-04 (Attachment A). The motion passed unanimously.

2. **Discussed Amendment Proposal 2021-01**

   Mr. Robinson said amendment proposal 2021-01 attempts to reduce the work required for determining the pre-reinsurance ceded reserve by eliminating the requirements for pre-reinsurance ceded exclusion tests. He said previous discussions have revealed that in certain situations, the amendment proposal could increase the work required. He said the intent of the amendment proposal is to revise the reserve requirements to reflect the qualitative nature of the pre-reinsurance ceded reserve in a manner that allows for a reduction in the work required to meet the requirements.

   Mr. Chupp expressed concerns about the intent of the amendment proposal. He said the amendment proposal will not significantly reduce the work required. He added that the proposed requirement is not consistent with the *Term and Universal Life Insurance Reserve Financing Model Regulation* (#787).

   Mr. Robinson acknowledged the inconsistency, but he noted that Model #787 is not reserve guidance.

   Ms. Hemphill said she is concerned that the work reduction may allow a company to forgo the pre-reinsurance stochastic reserve calculation in situations where it is greater than the pre-reinsurance deterministic and net premium reserves.

   Ms. Fenwick said ceding business to a reinsurer should not create an opportunity to avoid the exclusion testing.

   Ms. Ahrens, Ms. Fenwick, Mr. Bock and Mr. Serbinowski opposed exposing the amendment proposal. Mr. Sartain said while he is sympathetic to the issue, he would vote against exposing the amendment proposal unless industry voiced their support for it.

   After his motion to expose amendment proposal 2021-01 (Attachment B) was not seconded, Mr. Robinson withdrew the amendment proposal.

3. **Discussed Amendment Proposal 2019-33**

   Mary Bahna-Nolan (Academy Life Reserves Work Group—LRWG) said the comments received for the previous exposure of amendment proposal 2019-33 (Attachment C) were focused on correcting referencing and formatting issues. She briefly
discussed the revisions made to the amendment proposal in response to the comment letters received after the previous exposure. Discussion of the amendment proposal will continue May 6.

Having no further business, the Life Actuarial (A) Task Force adjourned.
Life Actuarial (A) Task Force/ Health Actuarial (B) Task Force
Amendment Proposal Form

1. Identify yourself, your affiliation and a very brief description (title) of the issue.

Brian Bayerle, ACLI – edits adopted changes to VM-02 for improved clarity and to remove potential circularity.

2. Identify the document, including the date if the document is “released for comment,” and the location in the document where the amendment is proposed:

Valuation Manual (January 1, 2021 edition), VM-02 Section 3.A

3. Show what changes are needed by providing a red-line version of the original verbiage with deletions and identify the verbiage to be deleted, inserted or changed by providing a red-line (turn on “track changes” in Word®) version of the verbiage. (You may do this through an attachment.)

See attached.

4. State the reason for the proposed amendment? (You may do this through an attachment.)

Subsequent the adopted changes to the federal tax code (IRC S. 7702), this proposed change would clarify the language in the previously adopted edits to VM-02 to avoid any potential circularity.
Valuation Manual VM-02

Section 3: Interest

A. The nonforfeiture interest rate for any life insurance policy issued in a particular calendar year beginning on and after the operative date of the Valuation Manual shall be equal to 125% of the calendar year statutory valuation interest rate defined for the NPR in the Valuation Manual for a life insurance policy with nonforfeiture values, whether or not such sections apply to such policy for valuation purposes, rounded to the nearer one-quarter of 1%, provided, however, that the nonforfeiture interest rate shall not be less than the Applicable Accumulation Test Minimum Rate in the Cash Value Accumulation Test under Section 7702 (Life Insurance Contract Defined) of the U.S. Internal Revenue Code.

Guidance Note: For flexible premium universal life insurance policies as defined in Section 3.D of the Universal Life Insurance Model Regulation (#585), this is not intended to prevent an interest rate guarantee less than the nonforfeiture interest rate.
Life Actuarial (A) Task Force/ Health Actuarial (B) Task Force
Amendment Proposal Form*

1. Identify yourself, your affiliation and a very brief description (title) of the issue.

   John Robinson, Director PBR – Valuation Actuary, MN

2. Identify the document, including the date if the document is “released for comment,” and the location in the document where the amendment is proposed:

3. Show what changes are needed by providing a red-line version of the original verbiage with deletions and identify the verbiage to be deleted, inserted or changed by providing a red-line (turn on “track changes” in Word®) version of the verbiage. (You may do this through an attachment.)

   See APPENDIX below.

4. State the reason for the proposed amendment? (You may do this through an attachment.)

   In circumstances where the ceding company computes separate pre-reinsurance and post-reinsurance reserves,

   (a) The post-reinsurance reserve is supported by assets held by the company.

   (b) The pre-reinsurance reserve is not supported by assets held by the company. According to ASOP 52 (PBR), Section 3.5.2, “...the calculation of a pre-reinsurance ceded stochastic reserve or deterministic reserve requires the construction of a hypothetical portfolio of starting assets and a corresponding model investment strategy. Possible methods for constructing the hypothetical portfolio include, but are not limited to, the following: ...”

   (c) When calculating the pre-reinsurance reserve, the company may be able to select sufficient starting assets for the calculation by “borrowing” assets not otherwise assigned to PBR calculations.

   (d) When calculating the pre-reinsurance reserve, the company may not be able to select sufficient starting assets for the calculation by “borrowing” assets not otherwise assigned to the PBR calculations. In this case, the qualified actuary might be required to use “notional assets”.

   (e) The pre-reinsurance reserve is not equivalent to the sum of the reserves held by the respective counterparties.
(f) SERT performed on a pre-reinsurance basis would similarly require 16 hypothetical asset portfolios, and this should be considered in assessing its value.

It follows from these observations that the pre-reinsurance reserve should not be subject to the same level of scrutiny as the post-reinsurance reserve and need not require the same degree of rigor.

The purpose of this APF is, under these circumstances, to eliminate the requirements to

1. perform separate exclusion tests for pre-reinsurance and post-reinsurance reserves; and
2. apply asset collar considerations for the pre-reinsurance reserve.

Implication for the reserve credit:

The following demonstrates that by eliminating pre-reinsurance exclusion tests and following the post-reinsurance exclusion test results, the resulting reserve credit may sometimes be higher and other times lower than when separate tests are performed.

Scenario 1: pre-reserve and post-reserve tested separately

APPENDIX

VM-20, Section 8.D: Determination of a Pre-Reinsurance Minimum Reserve

2. The pre-reinsurance-ceded minimum reserve shall be calculated pursuant to the requirements of VM-20, using methods and assumptions consistent with those used in calculating the minimum reserve, but excluding the effect of ceded reinsurance. The remainder of this Section 8.D.2 assumes that the pre-reinsurance-ceded minimum reserve and post-reinsurance-ceded minimum reserve for a group of policies are being calculated separately.

a. If, on a pre-reinsurance-ceded basis, a group of policies has not passed one or both of the exclusion tests pursuant to Section 6, then the required deterministic or stochastic reserves shall be calculated in determining the pre-reinsurance-ceded minimum reserve, even if not required for the minimum reserve.

b. The company shall use assumptions that represent company experience in the absence of reinsurance—for example, assuming that the business was managed in a manner consistent with the manner that retained business is managed—when computing the such pre-reinsurance-ceded minimum exclusion tests and reserves.

c. The requirement in Section 7.D.3 regarding the 98% to 102% collar does not apply when determining the amount of starting assets excluding the effect of ceded reinsurance for calculating the pre-reinsurance-ceded minimum reserve.

Commented [RJW(1)]: Clarify when this guidance applies.
Commented [RJW(2)]: Only post-reins exclusion testing required.
Commented [RJW(3)]: The issue is not whether it is able to pass, it is whether it has passed.
Commented [RJW(4)]: Using post-reins exclusion test result. Delete.
Commented [RJW(5)]: Consistent wording.
Commented [RJW(6)]: Consistent terminology; delete pre-reins exclusion test.
Commented [RJW(7)]: Consistent terminology.
Life Actuarial (A) Task Force/Health Actuarial (B) Task Force
Amendment Proposal Form*

1. Identify yourself, your affiliation and a very brief description (title) of the issue.

American Academy of Actuaries, Life Reserves Work Group

Addition of language to clarify the definition of individually underwritten life insurance and the applicability of Principle-Based Reserve (PBR) requirements for group insurance contracts with individual risk selection issued under insurance certificates.

2. Identify the document, including the date if the document is “released for comment,” and the location in the document where the amendment is proposed:

January 1, 2021, version of the Valuation Manual used.

3. Show what changes are needed by providing a red-line version of the original verbiage with deletions and identify the verbiage to be deleted, inserted or changed by providing a red-line (turn on “track changes” in Word®) version of the verbiage. (You may do this through an attachment.)

See Appendix

4. State the reason for the proposed amendment? (You may do this through an attachment.)

Individual insurance certificates issued under a group contract which utilize an individual risk selection process, pricing, premium rate structures and product features are similar to individual life insurance policies. They are currently excluded from VM-20 because they are filed under a group contract, but they should be subject to VM-20 due to this similarity. See Appendix.

*This form is not intended for minor corrections, such as formatting, grammar, cross-references or spelling. Those types of changes do not require action by the entire group and may be submitted via letter or email to the NAIC staff support person for the NAIC group where the document originated.

Notes: APF 2019-33
Appendix

Issue

Certain contracts issued under a master group contract require individual risk selection in order to qualify for issuance of the group insurance certificate; the certificates have similar acquisition approaches, provisions, certificate-holder rights, pricing, and risk classification; and they are managed in a similar manner as individual ordinary life insurance contracts. These individual certificates should follow the same reserve requirements as other individual life contracts of the same product type. Therefore, a change is needed within the Valuation Manual to bring these individual certificates into scope of VM-20.

Six changes are recommended:

1) Within the Reserve Requirements section (Section II), change the minimum reserve requirements to also apply to group life contracts which, other than the difference between issuing a policy and issuing a group certificate, have the same or mostly similar contract provisions, risk selection process, and underwriting as individual ordinary life contracts (Section II, subsection 1.D);

2) Within the Reserve Requirements section (Section II), add a transition period for individual group certificates issued on or before 1/1/2024 (Section II, subsections 1.F.1 and 1.F.2);

3) Within the Reserve Requirements section (Section II), add language and guidance note to subsection 1.G and the corresponding footnote to include premiums from group life contracts which have individual certificates that were issued using individual risk selection processes (Section II, subsection 1.G.1, footnote, and guidance note) and to clarify the Calculation for Exemption (Section II, subsection 1.G.2). Comment notes need to refer to NAIC Blanks (E) Working Group to update the PBR Supplement;

4) Add new paragraph, VM-20 Section 1.B (and reformat to make current paragraph Section 1.A) to clarify group life certificates issued using individual risk selection processes, including a definition and requirements to be met, are subject to the requirements of VM-20;

5) Add guidance note after first sentence in VM-20 Section 2.A.1 that group life certificates that meet the definition for individual risk selection process use the same VM-20 Reserving Categories as defined in Section 2;

6) Draft referral to the NAIC Blanks (E) Working Group to revise the VM-20 Reserves Supplement, Part 2 to report premiums for total Group Life and Group Life with certificates subjected to an individual risk selection process and which meet all of the conditions as defined in VM-20 Section 1.B separately.
II. Reserve Requirements

This section provides the minimum reserve requirements by type of product, as set forth in the seven subsections below, as follows:

1. Life Insurance Products
2. Annuity Products
3. Deposit-Type Contracts
4. Health Insurance Products
5. Credit Life and Disability Products
6. Riders and Supplemental Benefits
7. Claim Reserves

All reserve requirements provided by this section relate to business issued on or after the operative date of the Valuation Manual. All reserves must be developed in a manner consistent with the requirements and concepts stated in the Overview of Reserve Concepts in Section I of the Valuation Manual.

Guidance Note: The terms “policies” and “contracts” are used interchangeably.

Subsection 1: Life Insurance Products

A. This subsection establishes reserve requirements for all contracts issued on and after the operative date of the Valuation Manual that are classified as life contracts as defined in SSAP No. 50 in the AP&P Manual, with the exception of annuity contracts and credit life contracts. Minimum reserve requirements for annuity contracts and credit life contracts are provided below in subsection 2 and subsection 5, respectively.

B. Minimum reserve requirements for variable and nonvariable individual life contracts—excluding guaranteed issue life contracts, preneed life contracts, industrial life contracts, and policies of companies exempt pursuant to the life PBR exemption in paragraph D below—subsection 1.G are provided by VM-20, Requirements for Principle-Based Reserves for Life Products, except for election of the transition period in paragraph C below subsection 1.F.1 below. For this purpose, joint life policies are considered individual life.

C. Minimum reserve requirements of VM-20 are considered principle-based valuation requirements for purposes of the Valuation Manual.

D. Minimum reserve requirements for individual certificates under group life contracts which meet all the requirements in VM-20 Section 1.B are provided by VM-20, except for election of the transition period in subsection 1.F.1 below.

E. Minimum reserve requirements for life contracts not subject to VM-20 are those pursuant to applicable requirements in VM-A and VM-C. For guaranteed issue life contracts issued after Dec. 31, 2018, mortality tables are defined in VM Appendix M, Mortality Tables (VM-M), and the same table shall be used for reserve requirements as is used for minimum nonforfeiture requirements as defined in VM-02, Minimum Nonforfeiture Mortality and Interest.
F. A company may elect to establish minimum reserves pursuant to applicable requirements in VM-A and VM-C for:

1. Business described in subsection 1.D above and issued on or after the operative date of the Valuation Manual and prior to 1/1/2024.

2. Business not described subsection 1.D otherwise subject to VM-20 requirements and issued during the first three years following the operative date of the Valuation Manual.

A company electing to establish reserves using the requirements of VM-A and VM-C may elect to use the 2017 Commissioners’ Standard Ordinary (CSO) Tables as the mortality standard following the conditions outlined in VM-20 Section 3. If a company during the three years elects to apply VM-20 to a block of such business, then a company must continue to apply the requirements of VM-20 for future issues of this business.

G. Life PBR Exemption

1. A company meeting the condition in subsection 1.G.2 below may file a statement of exemption for individual ordinary life insurance policies and certificates, except for policies in subsection 1.G.3 below, issued directly or assumed during the current calendar year, that would otherwise be subject to VM-20. Such a statement must be filed with the domiciliary commissioner prior to July 1 of that year certifying that the condition of subsection 1.G.2 was met based on premiums from the prior calendar year annual statement. The statement of exemption must also be included with the NAIC filing for the second quarter of that year.

The domiciliary commissioner may reject such statement prior to September 1 and require the company to follow the requirements of VM-20 for the ordinary life policies covered by the statement.

2. Condition for Exemption:
   
a. The company has less than $300 million of exemption premium, and if the company is a member of an NAIC group of life insurers which includes other life insurance companies, the group has combined exemption premium of less than $600 million. Exemption premium is determined as follows:
   
a. The amount reported in the prior calendar year life/health annual statement, Exhibit 1, Part 1, Column 3 (“Ordinary Life Insurance”), line 20.1; plus
   
b. The portion of the amount in the prior calendar year life/health annual statement, Exhibit 1, Part 1, Column 3 (“Ordinary Life Insurance”), line 20.2 assumed from unaffiliated companies; minus
   
c. Amounts included in either (a) or (b) that are associated with guaranteed issue insurance policies and/or preneed life insurance policies; minus
   
d. Amounts included in either (a) or (b) that represent transfers of reserves in force as of the effective date of a reinsurance assumed transaction; plus
   
e. Amounts of premium for individual life certificates issued under a group life certificate which meet the conditions defined in VM-20, Section 1.B, and that are not included in either (a) or (b).

Guidance Note:

(i) Definitions of preneed and guaranteed issue insurance policy are in VM-01.

(ii) For statements of exemption filed for calendar year 2022 and beyond, the amount in subsection 2.e was reported in the prior calendar year life/health annual statement, VM-20 Reserve Supplement, Part 2, if applicable.

© 2010 National Association of Insurance Commissioners
3. Policies Excluded from the Life PBR Exemption:
   
a. Universal life with secondary guarantee (ULSG) policies with a secondary guarantee that does not meet the VM-01, Definitions for Terms in Requirements, definition of a “non-material secondary guarantee.”

4. Each exemption, or lack of an exemption, applies only to policies issued or assumed in the current year, and it applies to all future valuation dates for those policies. The minimum reserve requirements for the ordinary life policies subject to the exemption are those pursuant to applicable methods required in VM-A and VM-C using the mortality as defined in VM-20 Section 3.C.1 and VM-M Section 1.H.

VM Change 4 – VM-20: Requirements for Principle-Based Reserves for Life Products

VM-20: Requirements for Principles-Based Reserves for Life Products

Section 1: Purpose

A. These requirements establish the minimum reserve valuation standard for individual life insurance policies issued on or after the operative date of the Valuation Manual and subject to a principle-based valuation with an NPR floor under Model #820. These requirements constitute the Commissioners Reserve Valuation Method (CRVM) for policies of individual life insurance.

B. Individual life certificates under a group life contract shall be subject to the requirements of VM-20 if all of the following are met. These requirements constitute the Commissioners Reserve Valuation Method (CRVM) for such certificates.

1. An individual risk selection process, defined as follows, is used to obtain group life insurance coverage;

An individual risk selection process is one that is based on characteristics of the insured(s) beyond sex, gender, age, tobacco usage, and membership in a particular group. This may include, but is not limited to, completion of an application (beyond acknowledgement of membership to the group, sex, gender and age), questionnaire(s), online health history or tele-interview to obtain non-medical and medical or health history information, prescription history information, avocations, usage of tobacco, family history, or submission of fluids such as blood, Home Office Specimens (HOS), or oral fluid. The resulting risk classification is determined based on the characteristics of the individual insured(s) rather than the group, if any, of which it is a member (e.g., employer, affinity, etc.). The individual certificate holder is charged a premium rate based solely on the individual risk selection process and not on membership in a specific group.
The individual certificates utilize premiums or cost of insurance schedules and charges based on the individual applicant’s issue age, duration from underwriting, coverage amount and risk classification and there is a stated or implied schedule of maximum gross premiums or net cash surrender value required in order to continue coverage in force for a period in excess of one year;

3. The group master contract is designed, priced, solicited, and managed similar to individual ordinary life insurance policies rather than specific to the group as a whole;

4. The individual certificates have similar acquisition approaches, provisions, certificate-holder rights, pricing, and risk classification to individual ordinary life insurance contracts.

5. The individual certificates are issued on or after the operative date of the Valuation Manual except election of the transition period in Section 2, subsection 1.F.1.

Guidance Note: The use of evidence of insurability does not by itself constitute an individual risk selection process. Use of information obtained from a census or question(s) regarding gender, occupation, age, income and/or tobacco usage solely for purposes of determining a rate classification does not by itself qualify a group as having used an individual risk selection process. Group insurance where the underwriting based on the characteristics of the group and census data but where some individuals are subjected to individual risk selection as a result of compensation level, age, an existing medical condition or impairment, late entry into the group, failure of the group to meet minimum participation requirements or voluntary buy-up of increased coverage does not meet the definition of an individual risk selection process.

2. The individual certificates utilize premiums or cost of insurance schedules and charges based on the individual applicant’s issue age, duration from underwriting, coverage amount and risk classification and there is a stated or implied schedule of maximum gross premiums or net cash surrender value required in order to continue coverage in force for a period in excess of one year;

3. The group master contract is designed, priced, solicited, and managed similar to individual ordinary life insurance policies rather than specific to the group as a whole;

4. The individual certificates have similar acquisition approaches, provisions, certificate-holder rights, pricing, and risk classification to individual ordinary life insurance contracts.

5. The individual certificates are issued on or after the operative date of the Valuation Manual except election of the transition period in Section 2, subsection 1.F.1.

VM Change 5 - VM-20: Requirements for Principle-Based Reserves for Life Products

Section 2: Minimum Reserve

A. All policies subject to these requirements shall be included in one of the VM-20 Reserving Categories, as specified in Section 2.A.1, Section 2.A.2 and Section 2.A.3 below.

Guidance Note: Since group insurance subject to an individual risk selection process and meeting all the requirements in Section 1.B is subject to VM-20 requirements, Section 2.A shall apply—meaning that any such contracts will be included in one of the VM-20 Reserving Categories defined by Section 2.A.1, Section 2.A.2, and 2.A.3. All requirements in VM-31 which apply to a VM-20 Reserving Category shall apply to any group insurance subject to individual risk selection that has been included in that VM-20 Reserving Category.

The company may elect to exclude one or more groups of policies from the stochastic reserve calculation and/or the deterministic reserve calculation. When excluding a group of policies from a reserve calculation, the company must document that the applicable exclusion test defined in Section 6 is passed for that group of policies. The minimum reserve for each VM-20 Reserving Category is defined by Section 2.A.1, Section 2.A.2 and Section 2.A.3, and the total minimum reserve equals the sum of the Section 2.A.1, Section 2.A.2 and Section 2.A.3 results below, defined as:
VM Change 6 – VM-20 Reserves Supplement, Part 2: Life PBR Exemption

Refer to NAIC Blanks (E) Working Group, request for modification to the supplemental report for the Life PBR Exemption, to show the premiums for group life that utilized an individual risk selection process and meets all of the requirements in VM-20 Section 1.B. as these premiums are currently grouped together with other group insurance in Exhibit 1. As there are other instances where the ordinary life premiums are not included in the determination of the Life PBR Exemption (e.g., for guaranteed issue policies), it may be useful to request addition of the breakdown of premiums used to determine the exemption.

Possible insertion between questions 1 and 2 for disclosure of premiums used in the determination of eligibility for the Life PBR exemption, split by ordinary life and group subject to an individual risk selection process and meeting all of the requirements in VM-20 Section 1.B.
The Life Actuarial (A) Task Force met April 22, 2021. The following Task Force members participated: Doug Slape, Chair, represented by Mike Boerner and Rachel Hemphill (TX); Judith L. French, Vice Chair, represented by Peter Weber (OH); Lori K. Wing-Heier represented by Sharon Comstock (AK); Jim L. Ridling represented by Jennifer Li and Steve Ostlund (AL); Ricardo Lara represented by Ben Bock and Perry Kupferman (CA); Michael Conway represented by Eric Unger (CO); Andrew N. Mais represented by Wanchin Chou (CT); Doug Ommen represented by Mike Yanacheck (IA); Dana Popish Severinghaus represented by Bruce Sartin and Vincent Tsang (IL); Vicki Schmidt represented by Nicole Boyd (KS); Grace Arnold represented by Fred Andersen and John Robinson (MN); Chlora Lindley-Myers represented by William Leung (MO); Eric Dunning represented by Rhonda Ahrens (NE); Marlene Caride represented by Kevin Clarkson (NJ); Linda A. Lacewell represented by Bill Carmello and Amanda Fenwick (NY); Glen Mulready represented by Andrew Schallhorn (OK); Jonathan T. Pike represented by Tomasz Serbinowski (UT); Scott A. White represented by Craig Chupp (VA); and James A. Dodrill represented by Tim Sigman and Joylynn Fix (WV).

1. Exposed Amendment Proposal 2021-05

David Neve (Actuarial Resources Corporation of Georgia) said amendment proposal 2021-05 asserts that the term “modeled company investment strategy” is preferred to “model investment strategy,” and it seeks to use the former term consistently throughout the *Valuation Manual*. He said the proposal also clarifies that “modeled company investment strategy” refers to the investment strategy in the model prior to comparison to the alternative investment strategy. Additionally, the proposal modifies VM-21, Requirements for Principle-Based Reserves for Variable Annuities, to be consistent with the wording in VM-20, Requirements for Principle-Based Reserves for Life Products, clarifying that the assets in the alternative investment strategy should use the same weighted average life (WAL) as the assets in the modeled company investment strategy.

Mr. Leung made a motion, seconded by Mr. Kupferman, to expose amendment proposal 2021-05 (Attachment Ten-A) for a 21-day public comment period ending May 12. The motion passed unanimously.

2. Exposed Amendment Proposal 2021-06

Angela McNabb (NAIC) said amendment proposal 2021-06 revises VM-50, Experience Reporting Requirements, and VM-51, Experience Reporting Formats, to allow reinsurers and third-party administrators (TPAs) to submit mortality experience data on behalf of the direct writing company, and it revises VM-51 to remove a column that is not valid for the Regulatory Data Collection (RDC) system from the required data format.

Mr. Leung asked if there might be reinsurers or TPAs that are foreign entities without an NAIC company code. Pat Allison (NAIC) said foreign companies should contact the NAIC for assignment of a company code.

Mr. Weber made a motion, seconded by Mr. Leung, to expose amendment proposal 2021-06 (Attachment Ten-B) for a 30-day public comment period ending May 21. The motion passed unanimously.

3. Discussed Amendment Proposal 2021-01

Mr. Robinson said amendment proposal 2021-01 attempts to reduce the work required for determining the pre-reinsurance ceded reserve by eliminating the requirements for separate pre-reinsurance ceded exclusion tests and asset collar considerations. Ms. Fenwick asked if the proposal allows companies to use reinsurance to avoid having to calculate a stochastic reserve. She indicated that she is opposed to the proposal for that reason. Discussion of amendment proposal 2021-01 (Attachment Ten-C) will continue at the Task Force’s April 29 meeting.

Having no further business, the Life Actuarial (A) Task Force adjourned.

W:\National Meetings\2021\Summer\TF\LA\LATF Calls\04-22\Apr 22 Minutes.docx
Life Actuarial (A) Task Force/ Health Actuarial (B) Task Force

Amendment Proposal Form*

1. Identify yourself, your affiliation and a very brief description (title) of the issue.

Identification: David Neve, VP and Consulting Actuary, Actuarial Resources Corporation

Title of the Issue: Clarify the definition of modeled company investment strategy and the comparison to the alternative investment strategy.

2. Identify the document, including the date if the document is “released for comment,” and the location in the document where the amendment is proposed:

   January 1, 2020 NAIC Valuation Manual
   • VM-01 VM-21 Section 4.D

3. Show what changes are needed by providing a red-line version of the original verbiage with deletions and identify the verbiage to be deleted, inserted or changed by providing a red-line (turn on “track changes” in Word®) version of the verbiage. (You may do this through an attachment.)

   See attached.

4. State the reason for the proposed amendment? (You may do this through an attachment.)

   There is an inconsistency in VM-20/VM-21 and VM-31 regarding the term “model investment strategy”. The term “model investment strategy” is used throughout VM-20 and VM-21 to describe the investment strategy used in the model as a proxy for the company’s actual investment strategy. However, VM-31 uses the term “modeled company investment strategy” in several places rather than “model investment strategy”. “Modeled company investment strategy” is the preferred term, so VM-20 and VM-21 have been modified to use “modeled company investment strategy” so that the terminology in VM-20, VM-21 and VM-31 are consistent.

   Also, to address the ambiguity of whether the final investment strategy in the model is the initial investment strategy based on the company’s investment strategy or the alternative investment strategy when the alternative strategy is constraining, the term “modeled company investment strategy” has been added to the definitions in VM-01 (and a parenthetical has been added to VM-31) to clarify that the term refers to the investment strategy in the model prior to comparison to the alternative investment strategy. In addition, VM-21 has been modified to be consistent with the wording in VM-20 to clarify that the assets in the alternative investment strategy should use the same weighted average life (WAL) as the assets in the modeled company investment strategy.
VM-01 Changes:

VM-01 provides definitions for terms used in the Valuation Manual. The definitions in VM-01 do not apply to documents outside the Valuation Manual even if referenced or used by the Valuation Manual, such as the AP&P Manual. Some terms in the Valuation Manual may be defined in specific sections of the Valuation Manual instead of being defined in VM-01.

- The term “margin” means an amount included in the assumptions used to determine the modeled reserve that incorporates conservatism in the calculated value consistent with the requirements of the various sections of the Valuation Manual. It is intended to provide for estimation error and adverse deviation.

- The term “modeled company investment strategy” means the investment strategy used in the model that is intended to be a representation of the actual investment strategy of the company. It is before the comparison is made to the alternative investment strategy. It does not refer to the alternative investment strategy when the alternative investment strategy is constraining.

- The term “modeled reserve” means the deterministic reserve on the policies determined under VM-20 Section 2.A.1.a, 2.A.2.a and 2.A.3.b, plus the greater of the deterministic reserve and the stochastic reserve on the policies determined under Section 2.A.1.b, 2.A.2.b and 2.A.3.c.

VM-20 Changes:

Section 7: Cash-Flow Models

E. Reinvestment Assets and Disinvestment

1. At the valuation date and each projection interval as appropriate, model the purchase of general account reinvestment assets with available cash and net asset and liability cash flows in a manner that is representative of and consistent with the company’s investment policy for each model segment, subject to the following requirements:

   a. The modeled company investment strategy may incorporate a representation of the actual investment policy that ranges from relatively complex to relatively simple. In any case, the PBR Actuarial Report shall include documentation supporting the appropriateness of the representation relative to actual investment policy.

   b. The final maturities and cash-flow structures of assets purchased in the model, such as the patterns of gross investment income and principal repayments or a fixed or floating rate interest basis, shall be determined by the company as part of the model representation.

   c. The combination of price and structure for fixed income investments and derivative instruments associated with fixed income investments shall appropriately reflect the then-current U.S. Department of the Treasury (Treasury Department) curve along the relevant scenario and the requirements for gross asset spread assumptions stated below.

   d. For purchases of public non-callable corporate bonds, use the gross asset spreads over Treasuries prescribed in Section 9.F.8.a through Section 9.F.8.c. (For purposes of this
subsection, “public” incorporates both registered and 144a securities.) The prescribed spreads reflect current market conditions as of the model start date and grade to long-term conditions based on historical data at the start of projection year four.

e. For transactions of derivative instruments associated with fixed income investments, reflect the prescribed assumptions in Section 9.F.8.d for interest rate swap spreads.

f. For purchases of other fixed income investments, if included in the modeled company investment strategy, set assumed gross asset spreads over Treasuries in a manner that is consistent with, and results in reasonable relationships to, the prescribed spreads for public non-callable corporate bonds and interest rate swaps as defined in Section 9.F.8.

g. Notwithstanding the above requirements, the modeled reserve shall be the higher of that produced by the modeled company investment strategy and that produced by substituting an alternative investment strategy in which the fixed income reinvestment assets have the same weighted average life (WAL) as the reinvestment assets in the modeled company investment strategy and are all public non-callable corporate bonds with gross asset spreads, asset default costs and investment expenses by projection year that are consistent with a credit quality blend of 50% PBR credit rating 6 (A2/A) and 50% PBR credit rating 3 (Aa2/AA).

Policy loans, equities and derivative instruments associated with the execution of a clearly defined hedging strategy (in compliance with Section 7.L) are not affected by this requirement.

Guidance Note: VM-31 requires a demonstration of compliance with VM-20 Section 7.E.1.g. In many cases, particularly if the modeled company investment strategy does not involve callable assets, it is expected that the demonstration of compliance will not require running the reserve calculation twice. For example, an analysis of the weighted average net reinvestment spread on new purchases by projection year (gross spread minus prescribed default costs minus investment expenses) of the modeled company investment strategy compared to the weighted average net reinvestment spreads by projection year of the alternative strategy may suffice. The assumed mix of asset types, asset credit quality or the levels of non-prescribed spreads for other fixed income investments may need to be adjusted to achieve compliance.

VM-21 Changes:

Section 4: Determination of the Stochastic Reserve

D. Projection of Assets

4. General Account Assets

a. General account assets shall be projected, net of projected defaults, using assumed investment returns consistent with their book value and expected to be realized in future periods as of the date of valuation. Initial assets that mature during the projection and positive cash flows projected for future periods shall be invested in a manner that is representative of and consistent with the company’s investment policy, subject to the following requirements:

i. The final maturities and cash flow structures of assets purchased in the model, such as the patterns of gross investment income and principal repayments or a
fixed or floating rate interest basis, shall be determined by the company as part of the model representation;

ii. The combination of price and structure for fixed income investments and derivative instruments associated with fixed income investments shall appropriately reflect the projected Treasury Department curve along the relevant scenario and the requirements for gross asset spread assumptions stated below;

iii. For purchases of public non-callable corporate bonds, follow the requirements defined in VM-20 Sections 7.E, 7.F and 9.F. The prescribed spreads reflect current market conditions as of the model start date and grade to long-term conditions based on historical data at the start of projection year four;

iv. For transactions of derivative instruments associated with fixed income investments, reflect the prescribed assumptions in VM-20 Section 9.F for interest rate swap spreads;

v. For purchases of other fixed income investments, if included in the modeled company investment strategy, set assumed gross asset spreads over U.S. Treasuries in a manner that is consistent with, and results in reasonable relationships to, the prescribed spreads for public non-callable corporate bonds and interest rate swaps.

b. Notwithstanding the above requirements, the stochastic reserve shall be the higher of that produced by the modeled company investment strategy and that produced by substituting an alternative investment strategy in which the fixed income reinvestment assets have the same weighted average life (WAL) as the reinvestment assets in the modeled company investment strategy and are all public non-callable corporate bonds with gross asset spreads, asset default costs, and investment expenses by projection year that are consistent with a credit quality blend of 50% PBR credit rating 6 (A2/A) and 50% PBR credit rating 3 (Aa2/AA).

Policy loans, equities and derivative instruments associated with the execution of a clearly defined hedging strategy are not affected by this requirement.

Drafting Note: This limitation is being referred to Life Actuarial (A) Task Force for review.

VM-31 Changes:

Section 3: PBR Actuarial Report Requirements

D. Life Report – This subsection establishes the Life Report requirements for individual life insurance policies valued under VM-20.

6. Assets – The following information regarding the asset assumptions used by the company in performing a principle-based valuation under VM-20:
   
r. Modeled Company Investment Strategy and Reinvestment Assumptions – Description of the modeled company investment strategy (before comparison to the alternative investment strategy), including asset reinvestment and disinvestment assumptions, and
documentation supporting the appropriateness of the modeled company investment strategy compared to the actual investment policy of the company.

s. Alternative Investment Strategy – Documentation demonstrating compliance with VM-20 Section 7.E.1.g, showing that the modeled reserve is the higher of that produced using the modeled company investment strategy and the alternative investment strategy.

F. VA Report – This subsection establishes the VA Report requirements for variable annuity contracts valued under VM-21.

6. General Account Assets – The following information regarding the general account asset assumptions used by the company in performing a principle-based valuation under VM-21:

a. Modeled Company Investment Strategy and Reinvestment Assumptions – Description of the modeled company investment strategy (before the comparison to the alternative investment strategy), including asset reinvestment and disinvestment assumptions, and documentation supporting the appropriateness of the modeled company investment strategy compared to the actual investment policy of the company.

b. Alternative Investment Strategy – Documentation demonstrating compliance with VM-21 Section 4.D.4.b showing that the stochastic reserve is the higher of that produced using the modeled company investment strategy and the alternative investment strategy, based on the limitations defined in VM-21 Section 4.D.4.b.
Life Actuarial (A) Task Force/ Health Actuarial (B) Task Force

Amendment Proposal Form*

1. Identify yourself, your affiliation and a very brief description (title) of the issue.

Angela McNabb & Pat Allison – NAIC staff support

Revisions to VM-50 and VM-51 to allow for data experience reporting to be performed by a reinsurer or third-party administrator and a correction to VM-51 Appendix 4.

2. Identify the document, including the date if the document is “released for comment,” and the location in the document where the amendment is proposed:

3. Show what changes are needed by providing a red-line version of the original verbiage with deletions and identify the verbiage to be deleted, inserted or changed by providing a red-line (turn on “track changes” in Word®) version of the verbiage. (You may do this through an attachment.)

See attached redline document.

4. State the reason for the proposed amendment? (You may do this through an attachment.)

This APF is needed for the following reasons:

1. VM-51 Appendix 4 includes a column indicating the position within the data file for each field. This is not valid as the NAIC’s RDC system was designed to accept comma delimited files. This APF will remove that column.

2. The VM-51 Section 2.B states that companies must submit data for all their direct written business prior to reinsurance ceded. The only exception is in the case of assumption reinsurance where policies have been legally novated. The NAIC has received feedback from a number of companies indicating that they have business that is reinsured and fully administered by the reinsurer. Since the ceding companies do not have the data, it represents a hardship for them to submit this business.

3. Currently, VM-51 Appendix 4 only allows one company code. In order to allow a reinsurer or third-party administrator to submit data on behalf of the direct writer, the NAIC must be able to identify both the submitting company and the direct writer of the block of business. This APF adds an additional field to accomplish this. By having the submitting company’s code, any questions the NAIC has regarding the data can be directed to the submitting company without fear of breaching confidentiality.

4. Having separate identifiers for the submitting company and direct writer will allow the NAIC to validate the reconciliations required by VM-50 Section 4.B.3.

Below are examples showing how the reconciliations would work according to the amended language in VM-50 Section 4.B.3.

Example 1: This example illustrates the scenario described in redlined language in VM-50 Section 4.B.3.c. Company A is a direct writer selected for VM-51 reporting.

- The company has retained and administers 35,000 policies (out of a total of 100,000).
- Company B (a reinsurer not selected to submit their own business) administers 50,000 policies for Company A.
Experience Reporting Requirements VM-50
- Company C (a reinsurer selected to submit their own direct business) administers 15,000 policies for Company A.

<table>
<thead>
<tr>
<th>RECONCILIATION FOR COMPANY A (Direct Writer)</th>
<th>Policy Count</th>
<th>Insurance Amount</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total Business as Reported in Company A's Annual Statement</td>
<td>100,000</td>
<td>2,500,000,000</td>
</tr>
<tr>
<td>Business being reported by Company B</td>
<td>(50,000)</td>
<td>(1,250,000,000)</td>
</tr>
<tr>
<td>Business being reported by Company C</td>
<td>(15,000)</td>
<td>(50,000,000)</td>
</tr>
<tr>
<td>Totals included in Company A’s data submissions</td>
<td>35,000</td>
<td>1,200,000,000</td>
</tr>
</tbody>
</table>

Example 2: This example illustrates the scenario described in the redlined language in VM-50 Section 4.B.3.a. Company D is another direct writing company selected for VM-51 reporting. Company B has been asked by Companies A and D to submit data Company B has assumed and administers.
- Company B administers 50,000 policies for Company A.
- Company B administers 100,000 policies for Company D.
- Company B is not required to reconcile to their Annual Statement since they were not selected to submit their direct business.
- In this example, Company B is a reinsurer. However, Company B could also be a third-party administrator that is not an insurance company.

<table>
<thead>
<tr>
<th>RECONCILIATION FOR COMPANY B</th>
<th>Policy Count</th>
<th>Insurance Amount</th>
</tr>
</thead>
<tbody>
<tr>
<td>Business being reported on behalf of Company A</td>
<td>50,000</td>
<td>1,250,000,000</td>

<td>100,000</td>
<td>1,500,000,000</td>
</tr>
<tr>
<td>Totals included in Company B’s data submission</td>
<td>150,000</td>
<td>2,750,000,000</td>
</tr>
</tbody>
</table>

Example 3: This example illustrates the scenario described in redlined language in VM-50 Section 4.B.3.b. Company C has also been asked by company A to submit data Company C has assumed and administers.
- Company C has 1,500,000 policies reported in their Annual Statement.
- Company C has 250,000 of reinsurance assumed policies which should not be included in their submission. Reinsurance assumed should only be included when the ceding company requests that the reinsurer report it on their behalf.
- Company C has 1,250,000 policies of direct written business that they must report.
- In addition to Company C’s direct written business, they will also be reporting 15,000 policies that they administer on behalf of Company A (per Company A’s request).

Notes: APF 2021-06
Section 1: Overview

A. Purpose of the Experience Reporting Requirements

The purpose of this section is to define the requirements pursuant to Section 13 of Model #820 for
the submission and analysis of company data. It includes consideration of the experience reporting
process, the roles of the relevant parties, and the intended use of and access to the data, and the
process to protect the confidentiality of the data as outlined in Model #820.

B. PBR and the Need for Experience Data

The need for experience data includes but is not limited to:

1. PBR may require development of assumptions and margins based on company experience,
   industry experience or a blend of the two. The collection of experience data provides a
database to establish industry experience tables or factors, such as valuation tables or
factors as needed.

2. The development of industry experience tables provides a basis for assumptions when
   company data is not available or appropriate and provides a comparison basis that allows
the state insurance regulator to perform reasonableness checks on the appropriateness of
assumptions as documented in the actuarial reports.

3. The collection of experience data may assist state insurance regulators, reviewing actuaries,
auditors and other parties with authorized access to the PBR actuarial reports to perform
reasonableness checks on the appropriateness of principle-based methods and assumptions,
including margins, documented in those reports.

4. The collection of experience data provides an independent check on the accuracy and
completeness of company experience studies, thereby encouraging companies to establish
a disciplined internal process for producing experience studies. Industry aggregate or sub-
industry aggregate experience studies may assist an individual company for use in setting
experience-based assumptions. As long as the confidentiality of each company’s submitted
results is maintained, a company may obtain results of a study on companies’ submitted
experience for use in formulating experience assumptions.

5. The collection of experience data will provide a basis for establishing and updating the
assumptions and margins prescribed by regulators in the Valuation Manual.

6. The reliability of assumptions based on company experience is founded on reliable
historical data from comparable characteristics of insurance policies including, but not
limited to, underwriting standards and insurance policy benefits and provisions. As with
Experience Reporting Requirements

VM-50

all forms of experience data analysis, larger and more consistent statistical samples have a
greater probability of producing reliable analyses of historic experience than smaller or
inconsistent samples. To improve statistical credibility, it is necessary that experience data
from multiple companies be combined and aggregated.

7. The collection of experience data allows state insurance regulators to identify outliers and
monitor changes in company experience factors versus a common benchmark to provide a
basis for exploring issues related to those differences.

8. PBR is an emerging practice and will evolve over time. Research studies other than those
contemplated at inception may be useful to improvement of the PBR process, including
increasing the accuracy or efficiency of models. Because the collection of experience data
will facilitate these improvements, research studies of various types should be encouraged.

9. The collection of experience data is not intended as a substitute for a robust review of
companies’ methodologies or assumptions, including dialogue with companies’ actuaries.

Section 2: Statutory Authority and Experience Reporting Agent

A. Statutory Authority

1. Model #820 provides the legal authority for the Valuation Manual to prescribe experience
reporting requirements with respect to companies and lines of business within the scope of
the model.

2. The statutes and regulations requiring data submissions generally apply to all companies
licensed to sell life insurance, A&H insurance and deposit-type contracts. These companies
must submit experience data as prescribed by the Valuation Manual.

3. Section 4A(5) of Model #820 defines the data to be collected to be confidential.

B. Experience Reporting Agent

1. For the purposes of implementing the experience reporting required by state laws based on
Section 13 of Model #820, an Experience Reporting Agent will be used for the purpose of
collecting, pooling and aggregating data submitted by companies as prescribed by lines of
business included in VM-51.

2. The NAIC is designated as Experience Reporting Agent for the Statistical Plan for
Mortality beginning Jan. 1, 2020, and NAIC expertise in collecting and sorting data from
multiple sources into a cohesive database in a secure and efficient manner, but the
designation of the NAIC as Experience Reporting Agent does not preclude state insurance
regulators from independently engaging other entities for similar data required under this
Valuation Manual or other data purposes.

Section 3: Experience Reporting Requirements

A. Statistical Plans

1. Consistent with state laws based on Section 13 of Model #820, the Experience Reporting
Agent shall collect experience data based on statistical plans defined in the Valuation
Manual.

2. Statistical plans are detailed instructions that define the type of experience data being
collected (e.g., mortality; elective policyholder behavior, such as surrenders, lapses,
Experience Reporting Requirements VM-50

premium payment patterns, etc.; and company expense data, such as commissions, policy expenses, overhead expenses etc.). The state insurance regulators serving on the Life Actuarial (A) Task Force and Health Actuarial (B) Task Force, or any successor body, will be responsible for prescribing the requirements for any statistical plan by applicable line of business. For each type of experience data being collected, the statistical plan will define the data elements and format of each data element, as well as the frequency of the collection of experience data. The statistical plan will define the process and the due dates for submitting the experience data. The statistical plan will define criteria that will determine which companies must submit the experience data. The statistical plan will also define the scope of business that is to be included in the experience data collection, such as lines of business, product types, types of underwriting, etc. Statistical plans are defined in VM-51 of the Valuation Manual. Statistical plans will be added to VM-51 of the Valuation Manual when they are ready to be implemented. Additional data elements and formats to be collected will be added as necessary, in subsequent revisions to the Valuation Manual.

3. Data must conform to common data definitions. Standard definitions provide for stable and reliable databases and are the basis of meaningful aggregated insurance data. This will be accomplished through a uniform set of suggested minimum experience reporting requirements for all companies.

B. Role and Responsibilities of the Experience Reporting Agent

1. Based on requirements of VM-51, the Experience Reporting Agent may design its data collection procedures to ensure it is able to meet these regulatory requirements. The Experience Reporting Agent will provide sufficient notice to reporting companies of changes, procedures and error tolerances to enable the companies to adequately prepare for the data submission.

2. The Experience Reporting Agent will aggregate the experience of companies using a common set of classifications and definitions to develop industry experience tables.

3. The Experience Reporting Agent will seek to enter into agreements with a group of state insurance departments for the collection of information under statistical plans included in VM-51. The number of states that contract with the Experience Reporting Agent will be based on achieving a target level of industry experience prescribed by VM-51 for each line of business in preparing an industry experience table.

   a. The agreement between the state insurance department(s) and the Experience Reporting Agent will be consistent with any data collection and confidentiality requirements included within Model #820 and the Valuation Manual. Those state insurance departments seeking to contract with the Experience Reporting Agent will inform the Experience Reporting Agent of any other state law requirements, including laws related to the procurement of services that will need to be considered as part of the contracting process.

   b. Use of the Experience Reporting Agent by the contracting state insurance departments does not preclude those state insurance departments or any other state insurance departments from contracting independently with another Experience Reporting Agent for similar data required under this Valuation Manual or other data purposes.

4. The Life Actuarial (A) Task Force or Health Actuarial (B) Task Force will be responsible for the content and maintenance of the experience reporting requirements. The Life
Experience Reporting Requirements

Actuarial (A) Task Force or Health Actuarial (B) Task Force or a working group will monitor the data definitions, quality standards, appendices and reports described in the experience reporting requirements to assure that they take advantage of changes in technology and provide for new regulatory and company needs.

5. To ensure that the experience reporting requirements will continue to be useful, the Life Actuarial (A) Task Force or Health Actuarial (B) Task Force will seek to review each statistical plan on a periodic basis at least once every five years. The Life Actuarial (A) Task Force or Health Actuarial (B) Task Force should have regular dialogue, feedback and discussion of this topic. In seeking feedback and engaging in discussions, the Life Actuarial (A) Task Force or Health Actuarial (B) Task Force shall include a broad range of data users, including state insurance regulators, consumer representatives, members of professional actuarial organizations, large and small companies, and insurance trade organizations.

6. The Experience Reporting Agent will obtain and undergo at least annual external audits to validate that controls with respect to data security and related topics are consistent with industry standards and best practices. The Experience Reporting Agent will provide a copy of any report prepared in connection with such an audit, upon a company’s request. In the event of a material deficiency identified in the external audit or in the event of an identified security breach affecting the Experience Reporting Data, the Experience Reporting Agent shall notify the NAIC, and the states that have directed the Experience Reporting Agent to collect this information, of the nature and extent of such an issue. In the event of an identified security breach affecting Experience Reporting Data, the Experience Reporting Agent shall also notify any insurer whose data was affected. Upon good cause shown, the Experience Reporting Agent will take reasonable actions to protect the data under its control, including that the data submission process may be suspended until the security issue has been remediated. If data submission is suspended under this section, the Experience Reporting Agent will work with the states that have directed collection to issue appropriate guidance modifying the requirements of VM 51, Section 2.D. The term “good cause” shall mean that there is the chance of irreparable harm upon continuing the transmission of the data to the Experience Reporting Agent. Once the security issue has been remediated, the Experience Reporting Agent shall notify the NAIC and the states that have directed the Experience Reporting Agent to collect this information. The Experience Reporting Agent shall work in conjunction with the NAIC and the states that have directed the Experience Reporting Agent to collect this information to develop a revised data submission schedule for any deferred submissions. The revised schedule shall provide for reasonable timing for companies to provide such data.

C. Role of Other Organizations

The Experience Reporting Agent may ask for other organizations to play a role for one or more of the following items, including the execution of agreements and incorporation of confidentiality requirements where appropriate:

1. Consult with the NAIC (as appropriate) in the design and implementation of the experience retrieval process;
2. Assist with the data validation process for data intended to be forwarded to the SOA or other actuarial professional organizations to develop industry experience tables;
3. Analyze data, including any summarized or aggregated data, produced by the Experience Reporting Agent;
Experience Reporting Requirements VM-50

4. Create initial experience tables and any revised tables;

5. Provide feedback in the development and evaluation of requests for proposal for services related to the reporting of experience requirement;

6. Create statutory valuation tables as appropriate and necessary;

7. Determine and produce additional industry experience tables or reports that might be suggested by the data collected;

8. Work with the Life Actuarial (A) Task Force or Health Actuarial (B) Task Force, in accordance with the Valuation Manual governance process, in developing new reporting formats and modifying current experience reporting formats;

9. Support a close working relationship among all parties having an interest in the success of the experience reporting requirement.

Section 4: Data Quality and Ownership

A. General Requirements

1. The quality, accuracy and consistency of submitted data is key to developing industry experience tables that are statistically credible and represent the underlying emerging experience. Statistical procedures cannot easily detect certain types of errors in reporting of data. For example, if an underwriter fails to evaluate the proper risk classification for an insured, then the “statistical system” has little chance of detecting such an error unless the risk classification is somehow implausible.

2. To ensure data quality, coding a policy, loss, transaction or other body of data as anything other than what it is known as is prohibited. This does not preclude a company from coding a transaction with incomplete detail and reporting such transactions to the Experience Reporting Agent, but there can be nothing that is known to be inaccurate or deceptive in the reporting. An audit of a company’s data submitted to the Experience Reporting Agent under a statistical plan in VM-51 can include comparison of submitted data to other company files.

3. When the Experience Reporting Agent determines that the cause of an edit exception could produce systematic errors, the company must correct the error and respond in a timely fashion, with priority given to errors that have the largest likelihood to affect a significant amount of data. When an error is found that has affected data reported to the Experience Reporting Agent, the company shall report the nature of the error and the nature of its likely impact to the Experience Reporting Agent. Retrospective correction of data subject to systematic errors shall be done when the error affects a significant amount of data that is still being used for regulatory purposes and it is reasonably practical to make the correction through the application of a computer program or a procedure applied to the entire data set without the need to manually examine more than a small number of individual records.

B. Specific Requirements

1. Once the data file is submitted by the company, the Experience Reporting Agent will perform a validity check of the data elements within each data record in the data file for proper syntax and verify that required data elements are populated. The Experience Reporting Agent will notify the company of all syntax errors and any missing data elements
Experience Reporting Requirements

that are required. Companies are required to respond to the Experience Reporting Agent by submitting a corrected data file. The Experience Reporting Agent will provide sufficient notice to reporting companies of changes, procedures and error tolerances to enable the companies to adequately prepare for the data submission.

2. Each submission of data filed by an insurance company with the Experience Reporting Agent shall be balanced against a set of control totals provided by the company with the data submission. At a minimum, these control totals shall include applicable record counts, claim counts, amounts insured and claim amounts. Any submission that does not balance to the control totals shall be referred to the company for review and resolution.

3. Each company submitting experience data and each company on whose behalf data is being submitted as required in VM-51 will perform a reconciliation between its submitted experience data with its statistical and financial data, and provide an explanation of differences, to the Experience Reporting Agent. The reconciliation must include policy count and insurance amount.

a. If a third-party administrator that is not an insurance company or an insurance company not required to submit their direct data is submitting data on behalf of an insurance company, the reconciliation will consist of separate lines identifying each insurance company for whom this entity is submitting data.

b. If the third-party administrator is an insurance company that is required to submit their direct data, the reconciliation must include separate lines identifying each additional company whose data is being submitted.

c. The reconciliation to company statistical and financial data for both the direct writer and the reinsurer or third-party administrator must include lines indicating the amount of business that is being reported by the reinsurer or third-party administrator. The NAIC will use this information to confirm that all in-scope business is reported and there is no double counting of policies.

4. Validity checks are designed to identify:

a. Improper syntax or incomplete coding (e.g., a numeric field that is not numeric, missing elements of a date field);

b. Data elements containing codes that are not contained within the set of possible valid codes;

c. Data elements containing codes that are contained within the set of possible valid codes but are not valid in conjunction with another data element code;

d. Required data elements that are not populated.

5. Where quality would not appear to be significantly compromised, the Experience Reporting Agent may use records with missing or invalid data if such invalid or missing data do not involve a field that is relevant or would affect the credibility of the report. For companies with a body of data for a state, line of business, product type or observation period that fails to meet these standards, the Experience Reporting Agent will use its discretion, with regulatory disclosure of key decisions made, regarding the omission of the entire body of data or only including records with valid data. Completeness of reports is desirable, but not at the risk of including a body of data that appears to have an unreasonably high chance of significant errors.
Experience Reporting Requirements VM-50

6. Errors of a consistent nature are referred to as “systematic.” Incorrect coding instructions can introduce errors of a consistent nature. Programming errors within the data processing system of insurer company can also produce systematic miscoding as the system converts data to the required formats for experience reporting. Most systematic errors will produce data that, when reviewed using tests designed to reveal various types of systematic errors, will appear unreasonable and likely to be in error. In addition, some individual coding errors may produce erroneous results that show up when exposures and losses are compared in a systematic fashion. Such checking often cannot, however, provide a conclusive indication that data with unusual patterns is incorrect. The Experience Reporting Agent will perform tests and look at trends using previously reported data to determine if systematic errors or unusual patterns are occurring.

7. The Experience Reporting Agent will undertake reasonability checks that include the comparison of aggregate and company experience for underwriting class and type of coverage data elements for the current reporting period to company and aggregate experience from prior periods for the purpose of identifying potential coding or reporting errors. When reporting instructions are changed, newly reported data elements shall be examined to see that they correlate reasonably with data elements reported under the old instructions.

8. At a minimum, reasonability checks by the Experience Reporting Agent will include:
   a. An unusually large percentage of company data reported under a single or very limited number of categories;
   b. Unusual or unlikely reporting patterns in a company’s data;
   c. Claim amounts that appear unusually high or low for the corresponding exposures;
   d. Reported claims without corresponding policy values and exposures;
   e. Unreasonable loss frequencies or amounts in comparison to ranges of expectation that recognize statistical fluctuation;
   f. Unusual shifts in the distribution of business from one reporting period to the next.

9. If a company’s unusual pattern under Section 4.B.8.a, Section 4.B.8.b or Section 4.B.8.c is verified as accurate (that is, the reason for the apparent anomaly is an unusual mix of business), then it is not necessary that a similar pattern for the same company be reconfirmed year after year.

10. The Experience Reporting Agent will keep track of the results of the validity and reasonability checks and may adjust thresholds in successive reporting years to maintain a reasonable balance between the magnitude of errors being found and the cost to companies.

11. Results that may indicate a likelihood of critical indications, as defined below, will be reported to the company with an explanation of the unusual findings and their possible significance. When the possible or probable errors appear to be of a significant nature, the Experience Reporting Agent will indicate to the company that this is a “critical indication.” “Critical indications” are those that, if not corrected or confirmed, would leave a significant degree of doubt whether the affected data should be used in reports to the state insurance regulator and included in industry databases. It is intended that Experience Reporting Agents will have reasonable flexibility to implement this under the direction of the state insurance regulators. Also, under the direction of the state insurance regulators, the Experience Reporting Agent may grade the severity of indications, or it may simply...
Experience Reporting Requirements

identify certain indications as critical. While companies are expected to undertake a reasonable examination of all indications provided to them, they are not required to respond to every indication except for those labeled by the Experience Reporting Agent as “critical.”

12. The Experience Reporting Agent will use its discretion regarding the omission of data from reports owing to the failure of an insurer company to respond adequately to unusual reasonability indications. Completeness of reports is desirable, but not at the risk of including data that appears to have an unreasonably high chance of containing significant errors.

13. Companies shall acknowledge and respond to reasonability queries from the Experience Reporting Agent. This shall include specific responses to all critical indications provided by the Experience Reporting Agent. Other indications shall be studied for apparent errors, as well as for indications of systematic errors. Corrections for critical indications shall be provided to the Experience Reporting Agent or, when a correction is not feasible, the extent and nature of the error shall be reported to the Experience Reporting Agent.

C. Ownership of Data

1. Experience data submitted by companies to the Experience Reporting Agent will be considered the property of the companies submitting such data, but the recognition of such ownership will not affect the ability of state insurance regulators or the NAIC to use such information as authorized by state laws based on Model #820 or the Valuation Manual, or, in case of state insurance regulators, for solvency oversight, financial examinations and financial analysis.

2. The Experience Reporting Agent will be responsible for maintaining data, error reports, logs and other intermediate work products, and reports for use in processing, documentation, production and reproduction of reports provided to state insurance regulators in accordance with the Valuation Manual. The Experience Reporting Agent will be responsible for demonstrating such reproducibility at the request of state insurance regulators or an auditor designated by state insurance regulators.

Section 5: Experience Data

A. Introduction

1. Using the data collected under statistical plans, as defined in the Valuation Manual, the Experience Reporting Agent produces aggregate databases as defined by this Valuation Manual. The Experience Reporting Agent, and/or other persons assisting the Experience Reporting Agent, will utilize those databases to produce industry experience tables and reports as defined in the Valuation Manual. In order to ensure continued relevance of reports, each defined data collection and resulting report structure shall be reviewed for usefulness at least once every five years since initial adoption or prior review.

2. Data compilations are evaluated according to four distinct, and often competing, standards: quality, completeness, timeliness and cost. In general, quality is a primary goal in developing any statistical data report. The priorities of the other three standards vary according to the purpose of the report.

3. The Experience Reporting Agent may modify or enlarge the requirements of the Valuation Manual, through recommendation to the Life Actuarial (A) Task Force or Health Actuarial (B) Task Force and in accordance with the Valuation Manual governance process for information to accommodate changing needs and environments. However, in most cases,
Experience Reporting Requirements

changes to existing data reporting systems will be feasible only to provide information on future transactions. Requirements to submit new information may require that companies change their systems. Also, the Experience Reporting Agent may need several years before it can generate meaningful data meeting the new requirements with matching claims and insured amounts. The exact time frames for implementing new data requirements and producing reports will vary depending on the type of reports.

B. Design of Reports Linked to Purpose

Fundamental to the design of each report is an evaluation of its purpose and use. The Life Actuarial (A) Task Force and Health Actuarial (B) Task Force shall specify model reports responding to general regulatory needs. These model reports will serve the basic informational needs of state insurance regulators. To address a particular issue or problem, a state insurance regulator may have to request to the Life Actuarial (A) Task Force or Health Actuarial (B) Task Force that additional reports be developed.

C. Basic Report Designs

1. The Life Actuarial (A) Task Force or Health Actuarial (A) Task Force will designate basic types of reports to meet differing needs and time frames. Each statistical plan defined in VM-51 of the Valuation Manual will provide a detailed description of the reports, the frequency and time frame for the reports. Statistical compilations are anticipated to be the primary reports.

2. Statistical compilations are aggregate reports that generally match appropriate exposure amounts and transaction event amounts to evaluate the recent experience for a line of business. For example, a statistical compilation of mortality experience would match insurance face amounts exposed to death with actual death claims paid. Here the exposure amount is the total insurance face amount exposed to death, and the transaction event amounts would be the death claims paid. As another example, a statistical compilation of surrender experience would match total cash surrender amounts exposed to surrender with actual surrender amounts paid. Here the exposure amount is the total cash surrender amounts that could be surrendered, and the transaction event amounts would be the total surrender amounts actually paid. Statistical compilations can be performed for the industry or for the state of domicile.

3. In addition to statistical compilations, state insurance regulators can specify additional reports based on elements in the statistical plans in VM-51. State insurance regulators can also use statistical compilations and additional reports to evaluate non-formulaic assumptions.

4. The Life Actuarial (A) Task Force or Health Actuarial (B) Task Force will specify the reports to be provided to the professional actuarial associations to fulfill their roles as specified in Section 3.C of this VM-50. In general, the reports are expected to include statistical compilation at the industry level.

5. State insurance regulators can use the reports to review long-term trends. Aggregate experience results may indicate areas warranting additional investigation.

D. Supplemental Reports

1. For specific lines of business and types of experience data, state insurance regulators may request additional reports from the Experience Reporting Agent. State insurance regulators also may request custom reports, which may contain specific data or experience not regularly produced in other reports.
Experience Reporting Requirements VM-50

2. The regulator and the Experience Reporting Agent must negotiate time schedules for producing supplemental reports. The information in these reports is limited by the amount of data actually available and the manner in which it has been reported.

E. Reports to State Insurance Departments

The Experience Reporting Agent will periodically provide the following reports to state insurance departments:

1. A list of companies whose data is included in the compilation.

2. A list of companies whose data was excluded from the compilation because it fell outside of the tolerances set for missing or invalid data, or for any other reason.

Section 6: Confidentiality of Data

A. Confidentiality of Experience Data

1. The confidentiality of the experience data, experience materials and related information collected pursuant to the Valuation Manual is governed by state laws based on Section 14.A.(5) of Model #820. The following information is considered “confidential information” by state laws based on Section 14A(5) of the Model #820:

   Any documents, materials, data and other information submitted by a company under Section 13 of [the Standard Valuation Law] (collectively, “experience data”) and any other documents, materials, data and other information, including, but not limited to, all working papers, and copies thereof, created or produced in connection with such experience data, in each case that include any potentially company-identifying or personally identifiable information, that is provided to or obtained by the commissioner (together with any “experience data,” the “experience materials”) and any other documents, materials, data and other information, including, but not limited to, all working papers, and copies thereof, created, produced or obtained by or disclosed to the commissioner or any other person in connection with such experience materials.

2. Nothing in the experience reporting requirements or elsewhere within the Valuation Manual is intended to, or should be construed to, amend or supersede any applicable statutory requirements, or otherwise require any disclosure of confidential data or materials that may violate any applicable federal or state laws, rules, regulations, privileges or court orders applicable to such data or materials.

B. Treatment of Confidential Information

1. Confidential information may be shared only with those individuals and entities specified in state laws based on Section 14B(3) of Model #820. Any agreement between a state insurance department and the Experience Reporting Agent will address the extent to which the Experience Reporting Agent is authorized to share confidential information consistent with state law.

2. The Experience Reporting Agent may be required to use confidential information in order to prepare compilations of aggregated experience data that do not permit identification of individual company experience or personally identifiable information. These reports of aggregated information, including those reports referenced in Section 5 of VM-50, are not considered confidential information, and the Experience Reporting Agent may make publicly available such reports. Reports using aggregate experience data will have
Experience Reporting Requirements

sufficient diversification of data contributors to avoid identification of individual companies.

3. Consistent with state laws based on Section 14B(3) of the Model #820 and any agreements between a state insurance department and the Experience Reporting Agent, access to the confidential information will be limited to:

   a. State, federal or international regulatory agencies;

   b. The company with respect to confidential information it has submitted, and any reports prepared by the Experience Reporting Agent based on such confidential information;

   c. The NAIC, and its affiliates and subsidiaries;

   d. Auditor(s) of the Experience Reporting Agent for purposes of the experience reporting function outlined in this VM-50; and

   e. Other individuals or entities, including contractors or subcontractors of the Experience Reporting Agent, otherwise assisting the Experience Reporting Agent or state insurance regulators in fulfilling the purposes of VM-50. These other individuals or entities may provide services related to a variety of areas of expertise, such as assisting with performing industry experience studies, developing valuation mortality tables, data editing and data quality review. These other individuals and entities shall be subject to the same standards as the Experience Reporting Agent with respect to the maintenance of confidential information.

Appendix 2: Mortality Claims Questionnaire ..................................................................................... 51-8
Appendix 3: Additional Plan Code Form ........................................................................................... 51-10
Appendix 4: Mortality Data Elements and Format ............................................................................. 51-12

Section 1: Introduction

A. The experience reporting requirements are defined in Section 3 of VM-50. The experience reporting requirements state that the Experience Reporting Agent will collect experience data based on statistical plans that are defined in VM-51 of the Valuation Manual. Statistical plans are to be added to VM-51 of the Valuation Manual when they are ready to be implemented.

B. Each statistical plan shall contain the following information:

1. The type of experience data to be collected (e.g., mortality experience; policy behavior experience, such as surrenders, lapses, conversions, premium payment patterns, etc.; and company expense experience, such as commission expense, policy issue and maintenance expense, company overhead expenses etc.);

2. The scope of business to be included in the experience data to be collected (e.g., line(s) of business, such as individual or group, life, annuity or health; product type(s), such as term, whole life, universal life, indexed life, variable life, fixed annuity, indexed annuity, variable annuity, LTC or disability income; and type of underwriting, such as medically underwritten, simplified issue (SI), GI, accelerated, etc.);

3. The criteria for determining which companies or legal entities must submit the experience data to be collected;

4. The process for submitting the experience data to be collected, which will include the frequency of the data collection, the due dates for data collection and how the data is to be submitted to the Experience Reporting Agent;

5. The individual data elements and format for each data element that will be contained in each experience data record, along with detailed instructions defining each data element or how to code each data element. Additional information may be required, such as questionnaires and plan code forms that will assist in defining the individual data elements that may be unique to each company or legal entity submitting such experience data elements;

6. The experience data reports to be produced.
Experience Reporting Formats

VM-51

Section 2: Statistical Plan for Mortality

A. Type of Experience Collected Under This Statistical Plan

The type of experience to be collected under this statistical plan is mortality experience.

B. Scope of Business Collected Under This Statistical Plan

1. The data for this statistical plan is the individual ordinary life line of business. Such business is to include direct written business issued in the U.S., all values should be prior to any reinsurance ceded except for the situation defined in VM-51 Section 2.B.2. Therefore, reinsurance assumed from a ceding company shall be excluded from data collection to avoid double-counting of experience submitted by an issuer and by its reinsurers; however, Assumption reinsurance of an individual ordinary life line of business, where the assuming company is legally responsible for all benefits and claims paid, shall be included within the scope of this statistical plan. The ordinary life line of business does not include separate lines of business, such as SI/GI, worksite, individually solicited group life, direct response, paid-up annuity, home service, credit life, and corporate-owned life insurance (COLI)/bank-owned life insurance (BOLI)/charity-owned life insurance (CHOLI).

2. In the event a reinsurer or third-party administrator is responsible for administering a block of business, the reinsurer or third-party administrator may submit that block of business on behalf of the direct writer. In this case the reinsurer or third-party administrator must be identified in Appendix 4 Item 1 - Submitting Company ID, and the direct writer must be identified in Appendix 4 Item 2 - NAIC Company Code of Direct Writer.

   a. As defined in VM-50 Section 4.B.3, the reconciliation to company statistical and financial data for both the direct writing company and all reinsurers and/or third-party administrators must include lines indicating the amount of business that is being reported by the reinsurers and/or third-party administrators. The Experience Reporting Agent will compare the reconciliations for all business submitted by the direct writer and any reinsurers and/or third-party administrators to ensure that all business is included and there is no double counting of policies.

   b. If an insurance company is required to submit their direct written business and they also have reinsurance assumed business, they should only submit the assumed business if asked to do so by the ceding company since some ceding companies may not have been selected for data submission.

3. The direct writing company is ultimately responsible for all the data submitted for their company.

C. Criteria to Determine Companies That Are Required to Submit Experience Data

Companies with less than $50 million of direct individual life premium shall be exempted from reporting experience data required under this statistical plan. This threshold for exemption shall be measured based on aggregate premium volume of all affiliated companies and shall be reviewed annually and be subject to change by the Experience Reporting Agent. At its option, a group of nonexempt affiliated companies may exclude from these requirements affiliated companies with less than $10 million direct individual life premium provided that the affiliated group remains nonexempt.

Additional exemptions may be granted by the Experience Reporting Agent where appropriate, following consultation with the domestic insurance regulator, based on achieving a target level of approximately 85% of industry experience for the type of experience data being collected under this statistical plan.
D. Process for Submitting Experience Data Under This Statistical Plan

Data for this statistical plan for mortality shall be submitted on an annual basis. Each company required to submit this data shall submit the data using the Regulatory Data Collection (RDC) online software submission application developed by the Experience Reporting Agent. For each data file submitted by a company, the Experience Reporting Agent will perform reasonability and completeness checks, as defined in Section 4 of VM-50, on the data. The Experience Reporting Agent will notify the company within 30 days following the data submission of any possible errors that need to be corrected. The Experience Reporting Agent will compile and send a report listing potential errors that need correction to the company.

Data for this statistical plan for mortality will be compiled using a calendar year method. The reporting calendar year is the calendar year that the company submits the experience data. The observation calendar year is the calendar year of the experience data that is reported. The observation calendar year will be two years prior to the reporting calendar year. For example, if the current calendar year is 2018 and that is the reporting calendar year, the company is to report the experience data that was in-force or issued in calendar year 2016, which is the observation calendar year.

Given an observation calendar year of 20XX, the calendar year method requires reporting of experience data as follows:

i. Report policies in force during or issued during calendar year 20XX.

ii. Report terminations that were incurred in calendar year 20XX and reported before July 1, 20XX+1. However, exclude rescinded policies (e.g., 10-day free look exercises) from the data submission.

For any reporting calendar year, the data call will occur during the second quarter, and data is to be submitted according to the requirements of the Valuation Manual in effect during that calendar year. Data submissions must be made by Sept. 30 of the reporting calendar year. Corrections of data submissions must be completed by Dec. 31 of the reporting calendar year.

E. Experience Data Elements and Formats Required by This Statistical Plan

Companies subject to reporting pursuant to the criteria stated in Section 2.C are required to complete the data forms in Appendix 1, Appendix 2 and Appendix 3 as appropriate, and also complete the Experience Data Elements and Formats as defined in Appendix 4.

The data should include policies issued as standard, substandard (optional) or sold within a preferred class structure. Preferred class structure means that, depending on the underwriting results, a policy could be issued in classes ranging from a best preferred class to a residual standard class. Policies issued as part of a preferred class structure are not to be classified as substandard.

Policies issued as conversions from term or group contracts should be included. For these converted policies, the issue date should be the issue date of the converted policy, and the underwriting field will identify them as issues resulting from conversion.

Generally, each policy number represents a policy issued as a result of ordinary underwriting. If a single life policy, the base policy on a single life has the policy number and a segment number of 1. On a joint life policy, each life has separate records with the same policy number. The base policy on the first life has a segment number of 1, and the base policy on the second life has a segment number of 2. Policies that cover more than two lives are not to be submitted.
Experience Reporting Formats

Term/paid up riders or additional amounts of insurance purchased through dividend options on a policy issued as a result of ordinary underwriting are to be submitted. Each rider is on a separate record with the same policy number as the base policy and has a unique segment number. The details on the rider record may differ from the corresponding details on the base policy record. If underwriting in addition to the base policy underwriting is done, the coverage is given its own policy number.

Terminations (both death and non-death) are to be submitted. Terminations are to include those that occurred in the observation year and were reported by June 30 of the year after the observation year.

Plans of insurance should be carefully matched with the three-digit codes in item 19, Plan. These plans of insurance are important because they will be used not only for mortality experience data collection, but also for policyholder behavior experience data collection. It is expected that most policies will be matched to three-digit codes that specify a particular policy type rather than select a code that indicates a general plan type.

Each company is to submit data for in-force and terminated life insurance policies that are within the scope defined in Section 2.B except:

i. For policies issued before Jan. 1, 1990, companies may certify that submitting data presents a hardship due to fields not readily available in their systems/databases or legacy computer systems that continue to be used for older issued policies and differ from computer systems for newer issued policies.

ii. For policies issued on or after Jan. 1, 1990, companies must:
   a) Document the percentage that the face amount of policies excluded are relative to the face amount of submitted policies issued on or after Jan. 1, 1990; and
   b) Certify that this requirement presents a hardship due to fields not readily available in their systems/databases or legacy computer systems that continue to be used for older issued policies and differ from computer systems for newer issued policies.

F. Experience Data Reports Required by This Statistical Plan

1. Using the data collected under this statistical plan, the Experience Reporting Agent will produce an experience data report that aggregates the experience data of all companies whose data have passed all of the validity and reasonableness checks outlined in Section 4 of VM-50 and has been determined by the Experience Reporting Agent to be acceptable to be used in the development of industry mortality experience.

2. The Experience Reporting Agent will provide to the SOA or other actuarial professional organizations an experience data report of aggregated experience that does not disclose a company’s identity, which will be used to develop industry mortality experience and valuation mortality tables.
Experience Reporting Formats VM-51

3. As long as a company is licensed in a state, that state insurance regulator will be given access to a company’s experience data that is stored on a confidential database at the Experience Reporting Agent. Access by the state insurance regulator will be controlled by security credentials issued to the state insurance regulator by the Experience Reporting Agent.
Appendix 1: Preferred Class Structure Questionnaire

PREFERRED CLASS STRUCTURE QUESTIONNAIRE

Fill out this preferred class structure questionnaire based on companywide summaries, such as underwriting guideline manuals, compilations of issue instructions or other documentation.

The purpose of this preferred class structure questionnaire is to gather information on different preferred class structures. This questionnaire varies between nonsmoker/non-tobacco and smoker/tobacco users and provides for variations by issue year, face amount and plan. If the company has the standard Relative Risk Score (RR Score) information available, the company should map its set of preferred class structure to sets of RR Scores. **Except for new preferred class structures or new sets of RR Scores applied to existing preferred class structure(s), the response to the questionnaire should remain the same from year to year.**

If a company has determined sets of RR Scores for its preferred class structures, it should provide separate preferred class structure responses for each set of RR Scores applied to a preferred class structure. If a company has not determined sets of RR Scores for its preferred class structures, it should fill out this questionnaire with its preferred class structures and update the preferred class structure questionnaire at such future time that sets of RR Scores for the preferred class structures are determined. When sets of RR Scores are used, there is to be a one-to-one correspondence between a preferred class structure and a set of RR Scores.

The information given in this questionnaire will be used both to map a set of RR Scores to policy level data and as a check on the policy-level data submission. Submit this questionnaire along with the initial data submission to the Experience Reporting Agent.

Each preferred class structure must include at least two classes (e.g., one preferred class and one standard class). Make as many copies of this preferred class structure questionnaire as necessary for your individual life business and submit in addition to policy-level detail information.

Appendix 2: Mortality Claims Questionnaire

MORTALITY CLAIMS QUESTIONNAIRE

The purpose of this mortality claims questionnaire is for a company to respond to the questions whether or not it is submitting death claim data as specified. If the company is not submitting death claim data as specified, provide the additional detail requested.

Fill out this questionnaire for your individual life business and submit in addition to policy-level information.

<table>
<thead>

Name

Date

MORTALITY CLAIMS

1. If the data is provided using a reporting run-out that is other than six months, what run-out period was used? mm/dd/yyyy

2. The death claim amounts are to be for the total face amount and on a gross basis (before reinsurance). The data is based on:
   a. Total face amount (for policies that include the cash value in addition to the face amount as a death benefit, use only the face amount) as specified OR Other (describe):
      If not as specified, indicate time period for which this occurred: __________ - _______
   b. Gross basis (before reinsurance) as specified OR Other (describe):
      If not as specified, indicate time period for which this occurred: __________ - _______
      Is this the same basis used for face amounts included in the study data? Yes No

3. The date that the termination is reported is to be used for the termination reported date. The date that the termination actually occurred is to be used for the actual termination date. What dates are used for death claims in the study data with respect to?
   a) Termination reported date
      If not reported date, indicate basis for dates provided Reported date Other (describe):
   b) Actual termination date for death claims:
      Date of death Other (describe):
      If not date of death, indicate basis for dates provided
4. Death claims pending at the end of the observation period but paid during the subsequent six months following the observation year are to be included in the data submission. Claims that are still pending at the end of the six month run out are to be included.

Are such pending claims included in the study data? Yes No

If no indicate time period for which this occurred: __________________

5. The face amounts and death claim amounts are to be included without capping by amount. Are the face amounts and death claims/exposures included without capping by amount?

Yes No

If No, describe how face amounts and death claims are capped and at what amount the capping is being done.

6. For death claims on policies issued before 1990:

Are death claims matched up to a corresponding in-force policy? Yes No

If no, indicate approach used:

7. Please briefly describe any other unique aspects of the death claims data that are not covered above.
Experience Reporting Formats

Appendix 3: Additional Plan Code Form

If you need an additional plan code(s) for a product(s) in addition to those plan codes in Item 19, Plan, of the statistical plan for life insurance mortality, fill in this form using plan codes in the range 300 to 999. Your data submission should reflect the plan codes in this form. Make as many copies as necessary for your individual life business and submit in addition to policy-level information. When this form is used, it must be sent to the Experience Reporting Agent at the time that data is submitted.

For joint life policies, the base policy of the first life is to be put in a record with segment number ‘1,’ and the base policy of the second life is to be put in a separate record with segment number ‘2.’ Joint life policies with more than two lives are not to be submitted. Subsequent policy segments are in separate records with information about that coverage and differing segment numbers. Policy segments with the same policy number are to be submitted for: a) Single life policies; b) Joint life policies; c) Term/paid up riders; or d) Additional amounts of insurance including purchase through dividend options.</td>

4 = Unisex – Male  
5 = Unisex – Female |
| 8    | 36-43   | 8      | Date of Birth | Enter the numeric date of birth in YYYYYMMDD format |
| 9    | 44      | 1      | Age Basis    | 0 = Age Nearest Birthday  
1 = Age Last Birthday  
2 = Age Next birthday |
|      |         |        | **Drafting Note:** Professional actuarial organization will need to develop either age next birthday mortality tables or procedure to adapt existing mortality tables to age next birthday basis. |
| 10   | 45-47   | 3      | Issue Age    | Enter the insurance Issue Age |
| 11   | 48-55   | 8      | Issue Date   | Enter the numeric calendar year in YYYYYMMDD format. |
| 12   | 54      | 1      | Smoker Status (at issue) | Smoker status should be submitted where reliable.  
0 = Unknown  
1 = No tobacco usage  
2 = Nonsmoker  
3 = Cigarette smoker  
4 = Tobacco user |
| 13   | 52      | 1      | Preferred Class Structure Indicator | 0 = If no reliable information on multiple preferred and standard classes is available or if the policy segment was issued substandard or if there were no multiple preferred and standard classes available for this policy segment or if preferred information is unknown.  
1 = If this policy was issued in one of the available multiple preferred and standard classes for this policy segment.  
Note: If Preferred Class Structure Indicator is 0, or if preferred information is unknown, leave next four items blank. |
| 14   | 58      | 1      | Number of Classes in Nonsmoker Preferred Class Structure | If Preferred Class Structure Indicator is 0 or if Smoker Status is 0, 3 or 4, or if preferred information is unknown, leave blank. For nonsmoker or no tobacco usage policies that could have been issued as one of multiple preferred and standard classes, enter the number of nonsmoker preferred and standard classes available at time of issue. |
### Nonsmoker Preferred Class

If Preferred Class Structure Indicator is 0 or if Smoker Status is 0, 3 or 4, or if preferred information is unknown, leave blank.

For nonsmoker policy segments that could have been issued as one of multiple preferred and standard classes:
- 1 = Best preferred class
- 2 = Next Best preferred class after 1
- 3 = Next Best preferred class after 2
- 4 = Next Best preferred class after 3
- 5 = Next Best preferred class after 4
- 6 = Next Best preferred class after 5
- 7 = Next Best preferred class after 6
- 8 = Next Best preferred class after 7
- 9 = Next Best preferred class after 8

Note: The policy segment with the highest nonsmoker Preferred Class number should have that number equal to the Number of Classes in Nonsmoker Preferred Class Structure.

### Number of Classes in Smoker Preferred Class Structure

If Preferred Class Structure Indicator is 0 or if Smoker Status is 0, 1 or 2, or if preferred information is unknown, leave blank.

For smoker or tobacco user policies that could have been issued as one of multiple preferred and standard classes, enter the number of smoker preferred and standard classes available at time of issue.

### Smoker Preferred Class

If Preferred Class Structure Indicator is 0 or if Smoker Status is 0, 1 or 2, or if preferred information is unknown, leave blank.

For smoker policy segments that could have been issued as one of multiple preferred and standard classes:
- 1 = Best preferred class
- 2 = Next Best preferred class after 1
- 3 = Next Best preferred class after 2
- 4 = Next Best preferred class after 3
- 5 = Next Best preferred class after 4
- 6 = Next Best preferred class after 5
- 7 = Next Best preferred class after 6
- 8 = Next Best preferred class after 7
- 9 = Next Best preferred class after 8

Note: The policy segment with the highest Smoker Preferred Class number should have that number equal to the Number of Classes in Smoker Preferred Class Structure.

Life Actuarial (A) Task Force/ Health Actuarial (B) Task Force
Amendment Proposal Form*

1. Identify yourself, your affiliation and a very brief description (title) of the issue.

John Robinson, Director PBR – Valuation Actuary, MN

2. Identify the document, including the date if the document is “released for comment,” and the location in the document where the amendment is proposed:

3. Show what changes are needed by providing a red-line version of the original verbiage with deletions and identify the verbiage to be deleted, inserted or changed by providing a red-line (turn on “track changes” in Word®) version of the verbiage. (You may do this through an attachment.)

See APPENDIX below.

4. State the reason for the proposed amendment? (You may do this through an attachment.)

In circumstances where the ceding company computes separate pre-reinsurance and post-reinsurance reserves,

(a) The post-reinsurance reserve is supported by assets held by the company.

(b) The pre-reinsurance reserve is not supported by assets held by the company. According to ASOP 52 (PBR), Section 3.5.2, “...the calculation of a pre-reinsurance- ceded stochastic reserve or deterministic reserve requires the construction of a hypothetical portfolio of starting assets and a corresponding model investment strategy. Possible methods for constructing the hypothetical portfolio include, but are not limited to, the following:...”

(c) When calculating the pre-reinsurance reserve, the company may be able to select sufficient starting assets for the calculation by “borrowing” assets not otherwise assigned to PBR calculations.

(d) When calculating the pre-reinsurance reserve, the company may not be able to select sufficient starting assets for the calculation by “borrowing” assets not otherwise assigned to the PBR calculations. In this case, the qualified actuary might be required to use “notional assets”.

(e) The pre-reinsurance reserve is not equivalent to the sum of the reserves held by the respective counterparties.
(f) SERT performed on a pre-reinsurance basis would similarly require 16 hypothetical asset portfolios, and this should be considered in assessing its value.

It follows from these observations that the pre-reinsurance reserve should not be subject to the same level of scrutiny as the post-reinsurance reserve and need not require the same degree of rigor.

The purpose of this APF is, under these circumstances, to eliminate the requirements to
1. perform separate exclusion tests for pre-reinsurance and post-reinsurance reserves; and
2. apply asset collar considerations for the pre-reinsurance reserve.

Implication for the reserve credit:

The following demonstrates that by eliminating pre-reinsurance exclusion tests and following the post-reinsurance exclusion test results, the resulting reserve credit may sometimes be higher and other times lower than when separate tests are performed.

Scenario 1: pre-reserve and post-reserve tested separately

<table>
<thead>
<tr>
<th>Post-reserve</th>
<th>Pre-reserve</th>
</tr>
</thead>
<tbody>
<tr>
<td>DET</td>
<td>SET</td>
</tr>
<tr>
<td>Fail</td>
<td>Fail</td>
</tr>
<tr>
<td>Pass</td>
<td>Fail</td>
</tr>
<tr>
<td>Failure</td>
<td>Failure</td>
</tr>
</tbody>
</table>

Scenario 2: only post-reserve tested, pre-reserve uses same results

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

Comments

For pre-reserve, DR>SR, therefore reserve credit is higher than Scenario 1(a).
For pre-reserve, SR<DR, therefore reserve credit is lower than Scenario 1(b).
APPENDIX

VM-20, Section 8.D: Determination of a Pre-Reinsurance Minimum Reserve

2. The pre-reinsurance-ceded minimum reserve shall be calculated pursuant to the requirements of VM-20, using methods and assumptions consistent with those used in calculating the minimum reserve, but excluding the effect of ceded reinsurance. The remainder of this Section 8.D.2 assumes that the pre-reinsurance-ceded minimum reserve and post-reinsurance-ceded minimum reserve for a group of policies are being calculated separately.

a. If, on a pre-reinsurance-ceded basis, a group of policies is not able to pass, it has not passed one or both of the exclusion tests pursuant to Section 6, then the required deterministic or stochastic reserves shall be calculated in determining the pre-reinsurance-ceded minimum reserve, even if not required for the minimum reserve.

b. The company shall use assumptions that represent company experience in the absence of reinsurance—for example, assuming that the business was managed in a manner consistent with the manner that retained business is managed—when computing the pre-reinsurance-ceded minimum exclusion tests and reserves.

c. The requirement in Section 7.D.3 regarding the 98% to 102% collar does not apply when determining the amount of starting assets excluding the effect of ceded reinsurance for calculating the pre-reinsurance-ceded minimum reserve.

Commented [RJW(1):] Clarify when this guidance applies.

Commented [RJW(2):] Only post-reins exclusion testing required.

Commented [RJW(3):] The issue is not whether it is able to pass, it is whether it has passed.

Commented [RJW(4):] Using post-reins exclusion test result. Delete.

Commented [RJW(5):] Consistent wording.

Commented [RJW(6):] Consistent terminology; delete pre-reins exclusion test.

Commented [RJW(7):] Consistent terminology.

From: Pete Weber, Chair
The Index-Linked Variable Annuity (A) Subgroup

To: Mike Boerner, Chair
The Life Actuarial (A) Task Force

Subject: The Report of the Index-Linked Variable Annuity (A) Subgroup to the Life Actuarial (A) Task Force

The first call of the newly formed Index-Linked Variable Annuity (A) Subgroup was held July 15th. On that call, the Subgroup discussed preparing a document listing potential options for ILVA interim value guidance, along with the pros and cons of each. The goal is then to identify the optimal approach and develop into a recommendation to LATF. Additional, periodic calls are expected to continue into the fall with the goal of presenting a recommendation to LATF at the Fall National Meeting.
The Index-Linked Variable Annuity (A) Subgroup of the Life Actuarial (A) Task Force met July 15, 2021. The following Subgroup members participated: Pete Weber, Chair (OH); Tomasz Serbinowski, Vice Chair (UT); Sarvjit Samra (CA); Rhonda Ahrens (NE); Kevin Clarkson (NJ); William Carmello and Michael Cebula (NY); Rachel Hemphill, Mengting Kim, and John Carter (TX); and Craig Chupp (VA). Also participating were: Fred Andersen (MN); and David Hippen (WA).

1. Discussed Establishing Interim Values for Index-Linked Variable Annuities

Mr. Weber said the Subgroup is charged to: “Provide recommendations and changes, as appropriate, to nonforfeiture, or interim value requirements related to index-linked variable annuities.” He said the Subgroup is to address the issue of certain non-variable products being filed as variable annuities, therefore exempting them from the Standard Nonforfeiture Law for Individual Deferred Annuities (#805). He said the Variable Annuity Model Regulation (#250) defines a variable annuity as “a policy or contract that provides for annuity benefits that vary according to the investment experience of a separate account or accounts maintained by the insurer as to the policy or contract.” He said the benefits of index-linked variable annuities (ILVAs) do not vary according to the investment experience of a separate account.

Ms. Ahrens said that there may be ILVA (also known as registered index-linked annuities [RILAs]) products where the performance attempts to mimic the index. She said the Nebraska Department of Insurance (DOI) asks companies to provide information on the funding of the separate account and the relationship of the separate account to the index. She said solely being registered with the U.S. Securities and Exchange Commission (SEC) is not a sufficient criterion for acceptance as variable product under the Nebraska insurance statutes.

Mr. Clarkson said there are existing ILVA products that are regulated as variable annuities. He said the goal should be to apply existing rules to the regulation of these products.

Mr. Serbinowski suggested developing a document that states the issue and proposes options for addressing it. He said possible options are to: 1) amend Model #805; 2) provide guidance on what constitutes a variable product; or 3) do nothing. He said the document could then be sent to the Life Actuarial (A) Task Force for consideration.

Mr. Hippen provided his perspective on the history of the SEC and NAIC tug-of-war on variable products. He said that history has led to NAIC reluctance to take a strong stand on the development of models for variable products that might conflict with SEC regulations. Mr. Serbinowski said that the states should not avoid regulation of a product merely because the product is registered with the SEC. Mr. Weber noted that consistent regulation across states is a necessity. Mr. Hippen said that states have modified their variable product regulations over the years, so there is currently very little state uniformity.

Mr. Andersen said he reviewed ILVA product filings when the product was initially developed. He listed concepts that were considered in determining how the product should be placed:

1) Does the product fit appropriately with other annuities and financial products on the risk/return spectrum?
2) Is there evidence that customers understand the downside risk associated with the product?
3) Can a state insurance regulator disapprove unreasonable products?
4) Will stricter regulations be detrimental to consumers?

Mr. Serbinowski suggested drafting a document that lays out the situation and possible outcomes so that feedback can be solicited from state insurance regulators and industry. He said the Subgroup can present the Task Force with multiple options from which to choose. He said the options might be to: 1) do nothing; 2) develop an actuarial guideline; 3) revise Model #805; or 4) revise Model #250. Mr. Clarkson said that if the Subgroup decides that doing nothing is the appropriate course of action, it should document the details leading to the decision. Mr. Serbinowski said it will be important to provide the pros and cons for all the options. Mr. Carmello suggested starting with existing regulations from a state or the Interstate Insurance Product Regulation Commission (Compact). Mr. Weber said that is a viable option. Ms. Ahrens said the Subgroup could possibly start
with an existing process that could be converted into a guideline. Mr. Weber said Subgroup members will initiate efforts to follow through on the development of potential options.

Having no further business, the Index-Linked Variable Annuity (A) Subgroup adjourned.

From: Rhonda Ahrens, Chair  
Longevity Risk (E/A) Subgroup

To: Mike Boerner, Chair  
The Life Actuarial (A) Task Force

Subject: The Report of Longevity Risk (E/A) Subgroup to the Life Actuarial (A) Task Force

The Longevity Risk (E/A) Subgroup has not met since the Spring National Meeting. A Drafting Group has been formed to contemplate reserve requirements related to pension risk transfer (PRT) and longevity reinsurance (LR) transactions that are more specific to the PRT reserves and are not solely related to the longevity component. The Subgroup will reconsider C-2 RBC for PRT products or LR transactions after reviewing the Drafting Group’s recommendations for resolution of identified issues. The Subgroup Chair has had communication with the Academy of Actuaries Longevity Risk Task Force to ensure that the Task Force is aware of Subgroup needs and able to provide guidance as requested for the upcoming recommendations from the Drafting Group and VM-22 (A) Subgroup.
August 12, 2021

From: Rhonda Ahrens, Chair
       Guaranteed Issue (GI) Life Valuation (A) Subgroup

To: Mike Boerner, Chair
    The Life Actuarial (A) Task Force

Subject: The Report of Guaranteed Issue (GI) Life Valuation (A) Subgroup to the Life Actuarial (A) Task Force

The Guaranteed Issue (GI) Life Valuation (A) Subgroup has not met since the Spring National Meeting and may meet prior to the Winter National Meeting depending on availability of subgroup members or their concerns. Otherwise, it is in a dormant/monitoring mode given that there have been no new known studies of GI Life mortality that could prove useful in formulating a new prescriptive requirement for the reserves for GI Life products. One direction the subgroup could go is to continue consideration of how to adopt the GI Life table but require companies with credible experience to use a credibility weighted mortality whether their experience is lower or higher than the table.

From: Fred Andersen, Chair
The Experience Reporting (A) Subgroup

To: Mike Boerner, Chair
The Life Actuarial (A) Task Force

Subject: The Report of the Experience Reporting (A) Subgroup to the Life Actuarial (A) Task Force

The Experience Reporting (A) Subgroup has not met since the Spring National Meeting. Upcoming projects include monitoring the plans for collecting life insurance mortality and policyholder behavior data using the NAIC as the statistical agent, starting to develop mandatory reporting of variable annuity data, and continuing to work on evaluating actuarial aspects of accelerated underwriting.
August 12, 2021

From: Fred Andersen, Chair
The Indexed Universal Life (IUL) Illustration (A) Subgroup

To: Mike Boerner, Chair
The Life Actuarial (A) Task Force

Subject: The Report of the Indexed Universal Life (A) Subgroup to the Life Actuarial (A) Task Force

The Indexed Universal Life Illustration (A) Subgroup has not met since the Spring National Meeting. Research is being conducted on market developments following the adoption of Actuarial Guideline XLIX-A, The Application of the Life Illustrations Model Regulation to Policies with Index-Based Interest Sold On or After November 25, 2020 (AG 49-A). It is expected that a Subgroup call will be scheduled to present findings related to the research prior to the Fall National Meeting.
The VM-22 (A) Subgroup of the Life Actuarial (A) Task Force met July 21, 2021. The following Subgroup members participated: Bruce Sartain, Chair, and Vincent Tsang (IL); Ted Chang, Ahmad Kamil, Elaine Lam and Thomas Reedy (CA); Lei Rao-Knight (CT); Mike Yanacheak (IA); William Leung (MO); Rhonda Ahrens (NE); Seong-min Eom (NJ); Bill Carmello and Amanda Fenwick (NY); Rachel Hemphill and Karen Jiang (TX); Tomasz Serbinowski (UT); and Craig Chupp (VA). Also participating was: John Robinson (MN).

1. **Discussed the ARCWG Fixed Annuity Proposal**

Mr. Sartain discussed exposing the American Academy of Actuaries’ (Academy) Annuity Reserves and Capital Working Group (ARCWG) fixed annuity reserving framework proposal. Ms. Hemphill suggested that if the proposal is exposed, the cover page could indicate that the proposal is being considered, not endorsed, by the Subgroup.

Ben Slutsker (ARCWG) provided an overview of the fixed annuity reserving framework (Attachment One). He said the framework follows the structure of VM-21, Requirements for Principle-Based Reserves for Variable Annuities. He said the proposal uses “to be determined” in places where language for the standard projection amount is needed. He said Section 5, which covers reinsurance, goes into more depth than the corresponding section in VM-21. He suggested that commenters give that section a more rigorous review than some of the other sections that follow VM-21 more closely. He said Section 7, Exclusion Testing, borrows heavily from VM-20, Requirements for Principle-Based Reserves for Life Products. He noted that Section 13 retains the current language from VM-22, Statutory Maximum Valuation Interest Rates for Income Annuities, which will apply to contracts that pass an exclusion test. Mr. Slutsker said that in the Annuity Products section, the proposal provides criteria for differentiating fixed and variable annuities. Mr. Serbinowski suggested that perhaps specific definitions of fixed and variable annuities are needed. He said there are indexed products that are classified without considering risk as a criterion. Mr. Slutsker agreed that the line between the products is blurry. He said the framework lends itself to a principle-based approach to delineating fixed and variable products. Mr. Sartain asked whether amendment proposals adopted for the 2021 Valuation Manual and 2022 Valuation Manual are included in the fixed annuity framework proposal. Mr. Slutsker said the framework used the 2020 Valuation Manual as its basis. Mr. Sartain said the “VM-22 Exposure Priorities” document (Attachment Two) specifies items that commenters should consider as they review the fixed annuity framework.

2. **Exposed Alternative Definitions for Reserve Categories**

Mr. Chupp discussed the VM-22 product descriptions as modified (Attachment Three) to be considered as payout annuity reserve categories. He said that changes made since the Subgroup’s July 7 meeting are highlighted in yellow. He noted that the definitions for “pension risk transfer” and “longevity risk” are provided in the fixed annuity framework proposal. Mr. Serbinowski asked if a product that does not meet any of the payout annuity product descriptions would by default be considered an accumulation product. Mr. Chupp said that is the intent. Mr. Sartain said one of the challenges the Subgroup faces is to decide whether to use a bright line such as in this product description approach or to rely on a principle-based approach. Mr. Serbinowski suggested listing longevity reinsurance separately from pension risk transfer annuities.

Mr. Sartain discussed the principle-based reserving (PBR) category definitions (Attachment Four). He said the previous version of the definition required that the category determination be made based on the risks at issue. The current version changes “at issue” to “as of the valuation date.”

Mr. Serbinowski made a motion, seconded by Mr. Reedy, to expose the fixed annuity framework, the modified VM-22 product descriptions reserving category definition, and the PBR category definitions for a 90-day public comment period ending October 19. The motion passed unanimously.

3. **Exposed VM-22 Exposure Priorities**

Mr. Chupp made a motion, seconded by Mr. Reedy, to expose the VM-22 Exposure Priorities for a 90-day public comment period ending October 19. The motion passed unanimously.

Having no further business, the VM-22 (A) Subgroup adjourned.
July 16, 2021  
Bruce Sartain, Chair  
Valuation Manual (VM)-22 (A) Subgroup  
Life Actuarial (A) Task Force  
National Association of Insurance Commissioners (NAIC)

Dear Mr. Sartain,

The American Academy of Actuaries\(^1\) Annuity Reserves and Capital Work Group (ARCWG) presented a fixed annuity principle-based reserving (PBR) framework proposal to the VM-22 Subgroup during its October 21, 2020 meeting. This document provides ARCWG’s initial draft of NAIC Valuation Manual Section II and VM-22 requirements associated with the ARCWG proposal. We ask for the VM-22 Subgroup’s consideration of the language herein as a foundation for further drafting efforts, in your efforts to advance toward an NAIC fixed annuity PBR framework.

Please let us know if you have any follow-up inquiries in response to this document. Again, we appreciate the opportunity to propose the fixed annuity framework and all of the efforts made by the VM-22 Subgroup to focus on this topic.

Sincerely,

Ben Slutsker  
Chairperson, Annuity Reserves and Capital Work Group  
American Academy of Actuaries

---

\(^1\) The American Academy of Actuaries is a 19,500-member professional association whose mission is to serve the public and the U.S. actuarial profession. For more than 50 years, the Academy has assisted public policymakers on all levels by providing leadership, objective expertise, and actuarial advice on risk and financial security issues. The Academy also sets qualification, practice, and professionalism standards for actuaries in the United States.
VM-22 PBR: Requirements for Principle-Based Reserves for Non-Variable Annuities

Drafting Overview: This document is the ARCWG-proposed draft Valuation Manual wording for VM-22 PBR for non-variable annuities. The edits reflected in this draft are made in association with the recommendations in the Annuity Reserves Work Group-proposed VM-22 presentation, exposed by the VM-22 Subgroup in October 2020. Each section shows editorial mark-ups compared to existing VM-20 or VM-21 wording, which is included as a draft note at the beginning of each section (with the only exceptions being Sections 1 and 2 that do not contain mark-ups to existing Valuation Manual wording).

Section 1: Background

Drafting Note: All revisions shown in this section are in comparison to Section 1 in VM-21.

A. Purpose

These requirements establish the minimum reserve valuation standard for non-variable annuity ("contracts") as defined in the Section 2.A. and issued on or after 1/1/2024 operative date of the Valuation Manual as required by Model #820. For all contracts encompassed by the Scope, these requirements constitute the Commissioners Annuity Reserve Valuation Method (CARVM) and, for certain contracts encompassed in Section 2.A, the Commissioners Reserve Valuation Method (CRVM).

Guidance Note: CRVM requirements apply to some group pension contracts.

The contracts subject to these requirements may be aggregated with the contracts subject to Actuarial Guideline XLIII—CARVM for Variable Annuities (AG 43), published in Appendix C of the AP&P Manual, for purposes of performing and documenting the reserve calculations.

Guidance Note:

Effectively, through reference in AG 43, the reserve requirements in VM-21 also apply to those contracts issued prior to Jan. 1, 2017, that would not otherwise be encompassed by the scope of VM-21. Reserves for contracts subject to VM-21 or AG 43 may be computed as a single group. If a company chooses to aggregate business subject to AG 43 with business subject to VM-21 in calculating the reserve, then the provisions in VM-G apply to this aggregate principle-based valuation.

Guidance Note:

Relationship to RBC Requirements

These requirements anticipate that the projections described herein are used for the determination of RBC for all of the contracts falling within the scope of these requirements. These requirements and the RBC requirements for the topics covered within Sections 4.A through 4.E are identical. However, while the projections described in these requirements are performed on a basis that ignores federal income tax, a company may elect to conduct the projections for calculating the RBC requirements by including projected federal income tax in the cash flows and reducing the discount interest rates used to reflect the effect of federal income tax as described in the RBC requirements. A company that has elected to calculate RBC requirements in this manner may not switch back to using a calculation that ignores the effect of federal income tax without approval from the domiciliary commissioner.

B. Principles

The projection methodology used to calculate the stochastic reserve, as well as the approach used to develop the Alternative Methodology, is based on the following set of principles. These principles should be followed when interpreting and applying the methodology in these requirements and analyzing the resulting reserves.
Guidance Note: The principles should be considered in their entirety, and it is required that companies meet these principles with respect to those contracts that fall within the scope of these requirements and are in force as of the valuation date to which these requirements are applied.

Principle 1: The objective of the approach used to determine the stochastic reserve is to quantify the amount of statutory reserves needed by the company to be able to meet contractual obligations in light of the risks to which the company is exposed with an element of conservatism consistent with statutory reporting objectives.

Principle 2: The calculation of the stochastic reserve is based on the results derived from an analysis of asset and liability cash flows produced by the application of a stochastic cash-flow model to equity return and interest rate scenarios. For each scenario, the greatest present value of accumulated deficiency is calculated. The analysis reflects prudent estimate assumptions for deterministic variables and is performed in aggregate (subject to limitations related to contractual provisions) to allow the natural offset of risks within a given scenario. The methodology uses a projected total cash flow analysis by including all projected income, benefit, and expense items related to the business in the model and sets the stochastic reserve at a degree of confidence using the CTE measure applied to the set of scenario specific greatest present values of accumulated deficiencies that is deemed to be reasonably conservative over the span of economic cycles.

Guidance Note: Examples where full aggregation between contracts may not be possible include experience rated group contracts and the operation of reinsurance treaties.

Principle 3: The implementation of a model involves decisions about the experience assumptions and the modeling techniques to be used in measuring the risks to which the company is exposed. Generally, assumptions are to be based on the conservative end of the confidence interval. The choice of a conservative estimate for each assumption may result in a distorted measure of the total risk. Conceptually, the choice of assumptions and the modeling decisions should be made so that the final result approximates what would be obtained for the stochastic reserve at the required CTE level if it were possible to calculate results over the joint distribution of all future outcomes. In applying this concept to the actual calculation of the stochastic reserve, the company should be guided by evolving practice and expanding knowledge base in the measurement and management of risk.

Guidance Note: The intent of Principle 3 is to describe the conceptual framework for setting assumptions. Section 10 provides the requirements and guidance for setting contract holder behavior assumptions and includes alternatives to this framework if the company is unable to fully apply this principle.

Principle 4: While a stochastic cash-flow model attempts to include all real-world risks relevant to the objective of the stochastic cash-flow model and relationships among the risks, it will still contain limitations because it is only a model. The calculation of the stochastic reserve is based on the results derived from the application of the stochastic cash-flow model to scenarios, while the actual statutory reserve needs of the company arise from the risks to...
which the company is (or will be) exposed in reality. Any disconnect between the model and reality should be reflected in setting prudent estimate assumptions to the extent not addressed by other means.

**Principle 5:** Neither a cash-flow scenario model nor a method based on factors calibrated to the results of a cash-flow scenario model can completely quantify a company’s exposure to risk. A model attempts to represent reality but will always remain an approximation thereto and, hence, uncertainty in future experience is an important consideration when determining the stochastic reserve. Therefore, the use of assumptions, methods, models, risk management strategies (e.g., hedging), derivative instruments, structured investments or any other risk transfer arrangements (such as reinsurance) that serve solely to reduce the calculated stochastic reserve without also reducing risk on scenarios similar to those used in the actual cash-flow modeling are inconsistent with these principles. The use of assumptions and risk management strategies should be appropriate to the business and not merely constructed to exploit “foreknowledge” of the components of the required methodology.

C. Risks Reflected

1. The risks reflected in the calculation of reserves under these requirements arise from actual or potential events or activities that are both:
   a. Directly related to the contracts falling under the scope of these requirements or their supporting assets; and
   b. Capable of materially affecting the reserve.

2. Categories and examples of risks reflected in the reserve calculations include, but are not necessarily limited to:
   a. Asset risks
      i. Separate account fund performance.
      ii. Credit risks (e.g., default or rating downgrades).
      iii. Commercial mortgage loan roll-over rates (roll-over of bullet loans).
      iv. Uncertainty in the timing or duration of asset cash flows (e.g., shortening (prepayment risk) and lengthening (extension risk)).
      v. Performance of equities, real estate, and Schedule BA assets.
      vi. Call risk on callable assets.
      viii. Risk associated with hedge instrument (includes basis, gap, price, parameter estimation risks, and variation in assumptions).
   viii. Currency risk.
b. Liability risks
   i. Reinsurer default, impairment, or rating downgrade known to have occurred before or on the valuation date.
   ii. Mortality/longevity, persistency/lapse, partial withdrawal, and premium payment risks.
   iii. Utilization risk associated with guaranteed living benefits.
   iv. Anticipated mortality trends based on observed patterns of mortality improvement or deterioration, where permitted.
   v. Annuitzation risks.
   vi. Additional premium dump-ins or deposits (high interest rate guarantees in low interest rate environments).
   vii. Applicable expense risks, including fluctuation maintenance expenses directly attributable to the business, future commission expenses, and expense inflation/growth.

c. Combination risks
   i. Risks modeled in the company’s risk assessment processes that are related to the contracts, as described above.
   ii. Disintermediation risk (including such risk related to payment of surrender or partial withdrawal benefits).
   iii. Risks associated with revenue-sharing income.

3. The risks not necessarily reflected in the calculation of reserves under these requirements are:
   a. Those not reflected in the determination of RBC.
   b. Those reflected in the determination of RBC but arising from obligations of the company not directly related to the contracts falling under the scope of these requirements, or their supporting assets, as described above.
   a. Those not associated with the policies or contracts being valued, or their supporting assets.
   b. Determined to not be capable of materially affecting the reserve.

4. Categories and examples of risks not reflected in the reserve calculations include, but are not necessarily limited to:
   a. Asset risks
i. Liquidity risks associated with sudden and significant levels of withdrawals and surrenders “run on the bank.”

b. Liability risks
i. Reinsurer default, impairment or rating downgrade occurring after the valuation date.

ii. Catastrophic events (e.g., epidemics or terrorist events).

iii. Major breakthroughs in life extension technology that have not yet fundamentally altered recently observed mortality experience.

iv. Significant future reserve increases as an unfavorable scenario is realized.

c. General business risks
i. Deterioration of reputation.

ii. Future changes in anticipated experience (reparameterization in the case of stochastic processes), which would be triggered if and when adverse modeled outcomes were to actually occur.

iii. Poor management performance.

iv. The expense risks associated with fluctuating amounts of new business.

v. Risks associated with future economic viability of the company.

vi. Moral hazards.

vii. Fraud and theft.

D. Specific Definitions for VM-22

Buffer Annuity
Interchangeable term for Registered Index-Linked Annuity (RILA). See definition for Registered Index-Linked Annuity below.

Deferred Income Annuity (DIA)
An annuity which guarantees a periodic payment for the life of the annuitant or a term certain and payments begin one year or later after (or from) the issue date if the contract holder survives to a predetermined future age.

Fixed Indexed Annuity (FIA)
An annuity with an account value where the contract holder has the option for a portion or all of the account value to grow at a rate linked to an external index, typically with guaranteed principal.
Flexible Premium Deferred Annuity (FPDA)
An annuity with an account value established with a premium amount but allows for additional deposits to be paid into the annuity over time, resulting in an increase to the account value. The contract also has a guaranteed interest rate during the accumulation phase and has guaranteed mortality and interest rates applicable at the time of conversion to the payout phase.

Funding Agreement
A contract issued to an institutional investor (domestic and international non-qualified fixed income investors) that provides fixed or floating interest rate guarantees.

Guaranteed Investment Contract (GIC)
Insurance contract typically issued to a retirement plan (defined contribution) under which the insurer accepts a deposit (or series of deposits) from the purchaser and guarantees to pay a specified interest rate on the funds deposited during a specified period of time.

Index Credit Hedge Margin
A margin capturing the risk of inefficiencies in the company’s hedging program supporting index credits. This includes basis risk, persistency risk, and the risk associated with modeling decisions and simplifications. It also includes any uncertainty of costs associated with managing the hedging program and changes due to investment and management decisions.

Index Credit
Any interest credit, multiplier, factor, bonus, charge reduction, or other enhancement to policy values that is linked to an index or indices. Amounts credited to the policy resulting from a floor on an index account are included.

Index Crediting Strategy
The strategy defined in a contract to determine index credits for a contract. This refers to underlying index, index parameters, date, timing, and other elements of the crediting method.

Index Parameter
Cap, floor, participation rate, spreads, or other features describing how the contract utilizes the index.

Longevity Reinsurance
An agreement, typically a reinsurance arrangement covering one or more group or individual annuity contracts, under which an insurance company assumes the longevity risk associated with periodic payments made to specified annuitants under one or more immediate or deferred payout annuity contracts. A common example is participants in one or more underlying retirement plans.

Typically, the reinsurer pays a portion of the actual benefits due to the underlying annuitants (or, in some cases, a pre-agreed amount per annuitant), while the ceding insurance company retains the assets supporting the reinsured annuity payments and pays periodic, ongoing premiums to the reinsurer over the expected lifetime of benefits paid to the specified annuitants. Such agreements may contain net settlement provisions such that only one party makes ongoing cash payments in a particular period. Under these agreements, longevity risk may be transferred on either a
permanent basis or for a prespecified period of time, and these agreements may or may not permit early termination.

Agreements which are not treated as reinsurance under Statement of Statutory Accounting Principles (SSAP) No. 61R are not included in this definition. In particular, contracts under which payments are made based on the aggregate mortality experience of a population of lives which are not covered by an underlying group or individual annuity contract (e.g., mortality index-based longevity swaps) are not included in this definition.

**Market Value Adjustment (MVA) Annuity**
An annuity with an account value where withdrawals and full surrenders are subject to adjustments based on interest rates or index returns at the time of withdrawal/surrender. There could be ceilings and floors on the amount of the market-value adjustment.

**Modified Guaranteed Annuity (MGA)**
A type of market-value adjusted annuity contract where the underlying assets are held in an insurance company separate account and the value of which are guaranteed if held for specified periods of time. The contract contains nonforfeiture values that are based upon a market-value adjustment formula if held for shorter periods.

**Multiple Year Guaranteed Annuity (MYGA)**
A type of fixed annuity that provides a pre-determined and contractually guaranteed interest rate for specified periods of time, after which there is typically an annual reset or renewal of a multiple year guarantee period.

**Pension Risk Transfer (PRT) Annuity**
An annuity, typically a group contract or reinsurance agreement, issued by an insurance company providing periodic payments to annuitants receiving immediate or deferred benefits from one or more retirement plans. Typically, the insurance company holds the assets supporting the benefits, which may be held in the general or separate account, and retains not only longevity risk but also asset risks (e.g., credit risk and reinvestment risk).

**Registered Index-Linked Annuity (RILA)**
An annuity with an account value where the contract holder has the option for a portion or all of the account value to grow at a rate linked to an external index, similar to a Fixed Indexed Annuity, but with downside risk exposure that may not guarantee full principal repayment. These contracts may include a cap on upside returns, and may also include a floor on downside returns which may be below zero percent.

**Single Premium Immediate Annuity (SPIA)**
An annuity purchased with a single premium amount which guarantees a periodic payment for the life of the annuitant or a term certain and payments begin within one year after (or from) the issue date.

**Single Premium Deferred Annuity (SPDA)**
An annuity with an account value established with a single premium amount that grows with a guaranteed interest rate during the accumulation phase and has guaranteed mortality and interest
rates applicable at the time of conversion to the payout phase. May also include cases where the
premium is accepted for a limited amount of time early in the contract life, such as only in the
first duration.

**Stable Value Contract**
A contract that provides limited investment guarantees, typically preserving principal while
crediting steady, positive returns and protecting against losses or declines in yield. Underlying
asset portfolios typically consist of fixed income securities, which may sit in the insurer’s general
account, a separate account, or in a third-party trust. These contracts often support defined
contribution or defined benefit retirement plan liabilities.

**Structured Settlement Contract (SSC)**
A contract that provides periodic benefits and is purchased with a single premium amount
stemming from various types of claims pertaining to court settlements or out-of-court
settlements from tort actions arising from accidents, medical malpractice, and other causes.
Adverse mortality is typically expected for these contracts.

**Synthetic GIC**
Contract that simulates the performance of a traditional GIC through a wrapper, swap, or other
financial instruments, with the main difference being that the assets are owned by the
policyholder or plan trust.

**Term Certain Payout Annuity**
A contract issued, which offers guaranteed periodic payments for a specified period of time,
not contingent upon mortality or morbidity of the annuitant.

**Two-Tiered Annuity**
A deferred annuity with two tiers of account values. One, with a higher accumulation interest
rate, is only available for annuitization or death. The other typically contains a lower
accumulation interest rate, and is only available upon surrender.

1. The term “cash surrender value” means, for the purposes of these requirements, the amount
available to the contract holder upon surrender of the contract. Generally, it is equal to the
account value less any applicable surrender charges, where the surrender charge reflects
the availability of any free partial surrender option. However, for contracts where all or a
portion of the amount available to the contract holder upon surrender is subject to a market
value adjustment, the cash surrender value shall reflect the market value adjustment
consistent with the required treatment of the underlying assets. That is, the cash surrender
value shall reflect any market value adjustments where the underlying assets are reported
at market value, but it shall not reflect any market value adjustments where the underlying
assets are reported at book value.

2. The term “clearly defined hedging strategy” (CDHS) is defined in VM-01. In order to be
designated as a CDHS, the strategy must meet the principles outlined in Section 1.B
(particularly Principle 5) and shall, at a minimum, identify:

   a. The specific risks being hedged (e.g., delta, rho, vega, etc.).
   b. The hedge objectives.
   c. The risks not being hedged (e.g., variation from expected mortality, withdrawal,
...and other utilization or decrement rates assumed in the hedging strategy, etc.).

d. The financial instruments that will be used to hedge the risks.

e. The hedge trading rules, including the permitted tolerances from hedging objectives.

f. The metric(s) for measuring hedging effectiveness.

g. The criteria that will be used to measure hedging effectiveness.

h. The frequency of measuring hedging effectiveness.

i. The conditions under which hedging will not take place.

j. The person or persons responsible for implementing the hedging strategy.

Guidance Note: It is important to note that strategies involving the offsetting of the risks associated with VA guarantees with other products outside of the scope of these requirements (e.g., equity-indexed annuities) do not currently qualify as a clearly defined hedging strategy under these requirements.

3. The term “guaranteed minimum death benefit” (GMDB) means a provision (or provisions) for a guaranteed benefit payable on the death of a contract holder, annuitant, participant or insured where the amount payable is either (i) a minimum amount; or (ii) exceeds the minimum amount and is:

--- is increased by an amount that may be either specified by or computed from other policy or contract values; and

--- has the potential to produce a contractual total amount payable on such death that exceeds the account value, or

--- in the case of an annuity providing income payments, guarantees payment upon such death of an amount payable on death in addition to the continuation of any guaranteed income payments.

Guidance Note: The definition of GMDB includes benefits that are based on a portion of the excess of the account value over the net of premiums paid less partial withdrawals made (e.g., an earnings enhanced death benefit).

4. The term “total asset requirement” (TAR) means the sum of the reserve determined from the VM-21 requirements prior to any adjustment for the elective phase-in pursuant to Section 2.B plus the C3 RBC amount from LR027 step (paragraph D) prior to any adjustment for phase-in or smoothing.
Section 2: Scope and Effective Date

Drafting Note: There are no revisions shown in this section compared to VM-21 or other chapters Valuation Manual, since the write-up is largely new for VM-22.

A. Scope

Subject to the requirements of this VM-22 are annuity contracts, certificates and contract features, whether group or individual, including both life contingent and term-certain-only, directly written or assumed through reinsurance issued on or after 1/1/2024, with the exception of contracts or benefits listed below.

Products out of scope include:

- Contracts or benefits that are subject to VM-21 (such as variable annuities, RILAs, buffer annuities, and structured annuities)
- GICs
- Synthetic GICs
- Stable Value Contracts
- Funding Agreements

Products in scope of VM-22 include fixed annuities which consist of, but are not limited to, the following list:

- **Account Value Based Annuities**
  - Deferred Annuities (SPDA & FPDA)
  - Multi-Year Guarantee Annuities (MYGA)
  - Fixed Indexed Annuities (FIA)
  - Market-Value Adjustments (MVA)
  - Two-tiered Annuities
  - Guarantees/Benefits/Riders on Fixed Annuity Contracts

- **Payout Annuities**
  - Single Premium Immediate Annuities (SPIA)
  - Deferred Income Annuities (DIA)
  - Term Certain Payout Annuity
  - Pension Risk Transfer Annuities (PRT)
  - Structured Settlement Contracts (SSC)
  - Longevity Reinsurance

The company may elect to exclude one or more groups of contracts from the stochastic reserve calculation in certain situations, pursuant to the exclusion test requirements defined in Section 3.E of VM-22.

B. Effective Date & Transition

**Effective Date**

These requirements apply for valuation dates on or after January 1, 2024.
Transition

A company may elect to establish minimum reserves pursuant to applicable requirements in VM-A and VM-C for business otherwise subject to VM-22 PBR requirements and issued during the first three years following the effective date of VM-22 PBR. If a company during the three years elects to apply VM-22 PBR to a block of such business, then a company must continue to apply the requirements of VM-22 PBR for future issues of this business. Irrespective of the transition date, a company shall apply VM-22 PBR requirements to applicable blocks of business on a prospective basis starting at least three years after the effective date.
Section 3: Reserve Methodology

Drafting Note: All revisions shown in this section are in comparison to Section 3 in VM-21.

A. Aggregate Reserve

The aggregate reserve for contracts falling within the scope of these requirements shall equal the stochastic reserve (following the requirements of Section 4) plus the additional standard projection amount (following the requirements of Section 6) less any applicable PIMR for all contracts not valued under applicable requirements in VM-A and VM-C—the Alternative Methodology (Section 7), plus the reserve for any contracts determined using the Alternative Methodology valued under applicable requirements in VM-A and VM-C (following the requirements of Section 7).

Guidance Note: Contracts valued under applicable requirements in VM-A and VM-C are ones that pass the exclusion test and elect to not model PBR stochastic reserves, per the requirements in Section 3.E.

B. Impact of Reinsurance Ceded

Where reinsurance is ceded for all or a portion of the contracts, all components in the aggregate reserve shall be determined post-reinsurance ceded, that is net of any reinsurance cash flows arising from treaties that meet the statutory requirements that would allow the treaty to be accounted for as reinsurance. A, and pre-reinsurance ceded reserve also needs to be determined by, that is ignoring all reinsurance cash flows (such costs and benefits) in the reserve calculation.

C. To Be Determined The Additional Standard Projection Amount

The additional standard projection amount is determined by applying one of the two standard projection methods defined in Section 6. The same method must be used for all contracts within a group of contracts that are aggregated together to determine the reserve, and the additional standard projection amount excluding any contracts whose reserve is determined using the Alternative Methodology. The company shall elect which method they will use to determine the additional standard projection amount. The company may not change that election for a future valuation without the approval of the domiciliary commissioner.

D. The Stochastic Reserve

1. The stochastic reserve shall be determined based on asset and liability projections for the contracts falling within the scope of these requirements, excluding those contracts valued using the methodology pursuant to applicable requirements in VM-A and VM-C—Alternative Methodology, over a broad range of stochastically generated projection scenarios described in Section 8 and using prudent estimate assumptions as required in Section 3.F herein. The stochastic reserve may be determined in aggregate for all contracts falling within the scope of these requirements—i.e., a single model segment—or, at the option of the company, it may be determined by subgrouping contracts into model segments.

2. The stochastic reserve amount for any group of contracts shall be determined as CTE70 of the scenario reserves following the requirements of Section 4, with the exception of groups of contracts for which a company elects the Deterministic Certification Option in Section 7.E, which shall be determined as the scenario reserve following the requirements of Section 4.
3. The reserve may be determined in aggregate across various groups of contracts as a single model segment when determining the stochastic reserve if the business and risks are not managed separately or are part of the same integrated risk management program. Aggregation is permitted if a resulting group of contracts (or model segment) follows the listed principles:

   a. Aggregate in a manner that is consistent with the company’s risk management strategy and reflects the likelihood of any change in risk offsets that could arise from shifts between product types, and

   b. Using prudent actuarial judgement, consider the following elements when aggregating groups of contracts: whether groups of contracts are part of the same portfolio (or different portfolios that interact), same integrated risk management system, administered/managed together

4. Do not aggregate groups of contracts for which the company elects to use the Deterministic Certification Option in Section 7.E with any groups of contracts that do not use such option.

5. To the extent that these limits on aggregation result in more than one model segment, the stochastic reserve shall equal the sum of the stochastic reserve amounts computed for each model segment and scenario reserve amounts computed for each model segment for which the company elects to use the Deterministic Certification Option in Section 7.E.

E. Exclusion Test Alternative Methodology

For a group of variable deferred annuity contracts that contain either no guaranteed benefits or only GMDBs—i.e., no VAGLBs—the reserve may be determined using the Alternative Methodology described in Section 7 rather than using the approach described in Section 3.C and Section 3.D. However, in the event that the approach described in Section 3.C and Section 3.D has been used in prior valuations for that group of contracts, the Alternative Methodology may not be used without approval from the domiciliary commissioner.

The reserve for the group of contracts to which the Alternative Methodology is applied shall not be less than the aggregate cash surrender value of those contracts.

1. To the extent that certain groups of contracts pass one of the defined stochastic exclusion tests in Section 7.B, these groups of contracts may be valued using the methodology pursuant to applicable requirements in VM-A and VM-C, with the statutory maximum valuation rate for immediate annuities specified in Section 13.

   a. For dividend-paying contracts, a dividend liability shall be established upon following requirements in VM-A and VM-C, as described above, for the base contract.

   Guidance Note: The intention of contracts that pass the stochastic exclusion test is to provide the option to value contracts under VM-A and VM-C. This may apply to pre-PBR CARVM requirements in accordance with Actuarial Guideline XXXIII (AG33) methodology with type A, B, C rates for SPIAs issued before 2018; AG33 methodology with pre-PBR VM-22 rates for SPIAs issued on/after 2018; Actuarial Guideline XXXV (AG35) pre-PBR methodology for Fixed Indexed Annuities; and AG33 methodology (with interest rate updates for modernization initiatives on new contracts) for non-SPIAs.

   2. The approach for grouping contracts when performing the exclusion tests should follow the same principles that underlie the aggregation approach for model segments discussed for Stochastic Reserves in Section D above.
F. Allocation of the Aggregate Reserve to Contracts

The aggregate reserve shall be allocated to the contracts falling within the scope of these requirements using the method outlined in Section 12.

G. Prudent Estimate Assumptions:

1. With respect to the Stochastic Reserve in Section 3.C, the company shall establish the prudent estimate assumption for each risk factor in compliance with the requirements in Section 12 of Model #820 and must periodically review and update the assumptions as appropriate in accordance with these requirements.

2. The qualified actuary, to whom responsibility for this group of contracts is assigned, shall annually review relevant emerging experience for the purpose of assessing the appropriateness of the anticipated experience assumption. If the results of statistical testing or other testing indicate that previously anticipated experience for a given factor is inadequate, then the qualified actuary shall set a new, adequate, anticipated experience assumption for the factor.

4-3. To determine the prudent estimate assumptions, the stochastic reserve shall also follow the requirements in Sections 4 and 9 for asset assumptions, Section 10 for policyholder behavior assumptions, and Section 11 for mortality assumptions.

G. Reserve to Be Held in the General Account

The portion of the aggregate reserve held in the general account shall not be less than the excess of the aggregate reserve over the aggregate cash surrender value held in the separate account and attributable to the separate account portion of all such contracts. For contracts for which a cash surrender value is not defined, the company shall substitute for cash surrender value held in the separate account the implicit amount for which the contract holder is entitled to receive income based on the performance of the separate account. For example, for a variable payout annuity for which a specific number of units is payable, the implicit amount could be the present value of that number of units, discounted at the assumed investment return and defined mortality, times the unit value at the valuation date.

Guidance Note: This approach is equivalent to assuming that the separate account performance is equal to the assumed investment return.
Section 4: Determination of Stochastic Reserve

Drafting Note: All revisions shown in this section are in comparison to Section 4 in VM-21.

A. Projection of Accumulated Deficiencies

1. General Description of Projection

The projection of accumulated deficiencies shall be made ignoring federal income tax in both cash flows and discount rates, and it shall reflect the dynamics of the expected cash flows for the entire group of contracts, reflecting all product features, including any guarantees provided under the contracts using prudent estimate liability assumptions defined in Sections 10 and 11 and asset assumptions defined in Section 4.D. The company shall project cash flows including the following:

a. Revenues received by the company including gross premiums received from the policyholder (including any due premiums as of the projected start date).

b. All material benefits projected to be paid to policyholders—including, but not limited to, death claims, surrender benefits and withdrawal benefits—reflecting the impact of all guarantees and adjusted to take into account amounts projected to be charged to account values on general account business. Any guarantees, in addition to market value adjustments assessed on projected withdrawals or surrenders, shall be taken into account.

Guidance Note: Amounts charged to account values on general account business are not revenue; examples include rider charges and expense charges.

c. Non-Guaranteed Elements (NGE) cash flows as described in Section 10.J.

d. Insurance company expenses (including overhead and investment expense), commissions, fund expenses, contractual fees and charges, and revenue-sharing income received by the company (net of applicable expenses), and

e. Net cash flows associated with any reinsurance.

f. Cash flows from hedging instruments as described in Section 4.A.4. are to be reflected on a basis consistent with the requirements herein.

g. Cash receipts or disbursements associated with invested assets (other than policy loans) as described in Section 4.D.4, including investment income, realized capital gains and losses, principal repayments, asset default costs, investment expenses, asset prepayments, and asset sales.

h. If modeled explicitly, cash flows related to policy loans as described in Section 10.I.2, including interest income, new loan payments and principal repayments.
Guidance Note: Future net policy loan cash flows include: policy loan interest paid in cash plus repayments of policy loan principal, including repayments occurring at death or surrender (note that the future benefits in Section 4.A.1.b are before consideration of policy loans), less additional policy loan principal (but excluding policy loan interest that is added to the policy loan principal balance). Cash flows from any fixed account options also shall be included. Any market value adjustment assessed on projected withdrawals or surrenders also shall be included (whether or not the cash surrender value reflects market value adjustments). Throughout the projection, all assumptions shall be determined based on the requirements herein. Accumulated deficiencies shall be determined at the end of each projection year as the sum of the accumulated deficiencies for all contracts within each model segment.

Guidance Note: Section 4.A.1 requires market value adjustments (MVAs) on liability cash flows to be reflected because in a cash flow model, assets are assumed to be liquidated at market value to cover the cash outflow of the cash surrender; therefore, inclusion of the market value adjustment aligns the asset and liability cash flows. This may differ from the treatment of MVAs in the definition of cash surrender value (Section 1.D), which defines the statutory reserve floor for which the values must be aligned with the annual statement value of the assets.

2. Grouping of Variable Funds and Subaccounts Index Crediting Strategies

The portion of the starting asset amount held in the separate account represented by the variable funds and the corresponding account values. Index crediting strategies may be grouped for modeling using an approach that recognizes the investment guidelines and objectives of the funds each index crediting strategy. In assigning each variable fund and the variable subaccounts index crediting strategy to a grouping for projection purposes, the fundamental characteristics of the fund index crediting strategy shall be reflected, and the parameters shall have the appropriate relationship to the stochastically generated projection scenarios described in Section 8. The grouping shall reflect characteristics of the efficient frontier (i.e., returns generally cannot be increased without assuming additional risk).

Index accounts sharing similar index crediting strategies may also be grouped for modeling to an appropriately crafted proxy strategy normally expressed as a linear combination of recognized market indices, sub-indices or funds, in order to develop the investment return paths and associated interest crediting. Each index crediting strategy’s specific risk characteristics, associated index parameters, and relationship to the stochastically generated scenarios in Section 8 should be considered before grouping or assigning to a proxy strategy. Grouping and/or development of a proxy strategy may not be done in a manner that intentionally understates the resulting reserve.

An appropriate proxy fund for each variable subaccount shall be designed in order to develop the investment return paths. The development of the scenarios for the proxy funds is a fundamental step in the modeling and can have a significant impact on results. As such, the company must map each variable account to an appropriately crafted proxy fund normally expressed as a linear combination of recognized market indices, sub-indices or funds.
3. Model Cells

Projections may be performed for each contract in force on the date of valuation or by assigning contracts into representative cells of model plans using all characteristics and criteria having a material impact on the size of the reserve. Assigning contracts to model cells may not be done in a manner that intentionally understates the resulting reserve.

4. Modeling of Hedges

a. For a company that does not have a CDHStie direct to the contracts falling under the scope of VM-22 stochastic reserve requirements:

i. The company shall not consider the cash flows from any future hedge purchases or any rebalancing of existing hedge assets in its modeling.

ii. Existing hedging instruments that are currently held by the company in support of the contracts falling under the scope of these requirements shall be included in the starting assets. The hedge assets may then be considered in one of two ways:

   a) Include the asset cash flows from any contractual payments and maturity values in the projection model; or

   b) No hedge positions—in which case the hedge positions held on the valuation date are replaced with cash and/or other general account assets in an amount equal to the aggregate market value of these hedge positions.

Guidance Note: If the hedge positions held on the valuation date are replaced with cash, then as with any other cash, such amounts may then be invested following the company’s investment strategy.

A company may switch from method a) to method b) at any time, but it may only change from b) to a) with the approval of the domiciliary commissioner.

b. For a company with a CDHSthat has a future hedging program tied directly to the contracts falling under the scope of VM-22 stochastic reserve requirements:

i. For a hedging program with hedge payoffs that offset interest credits associated with indexed interest strategies (indexed interest credits):

   a) In modeling cash flows, the company shall include the cash flows from future hedge purchases or any rebalancing of existing hedge assets that are intended solely to offset interest credits to policyholders

   b) Existing hedging instruments that are currently held by the company for this purpose in support of the contracts falling under the scope of these requirements shall be included in the starting assets. Existing hedging instruments that are currently held by the
c) An Index Credit Hedge Margin for these instruments shall be reflected by reducing index interest credit hedge payoffs by a margin multiple that shall be justified by sufficient and credible company experience and be no less than \([X\%]\) multiplicatively of the interest credited. In the absence of sufficient and credible company experience, a margin of \([Y\%]\) shall be assumed. There is no cap on the index credit hedge margin if company experience indicates actual error is greater than \([Y\%]\). It is permissible to substitute stress-testing for sufficient and credible experience if such stress-testing comprehensively considers a robust range of future market conditions.

ii. For a company that hedges any contractual obligation or risks other than indexed interest credits, the detailed requirements for the modeling of hedges are defined in Section 9. The following requirements do not supersede the detailed requirements.

a) The appropriate costs and benefits of hedging instruments that are currently held by the company in support of the contracts falling under the scope of these requirements shall be included in the projections used in the determination of the stochastic reserve.

b) The projections shall take into account the appropriate costs and benefits of hedge positions expected to be held in the future through the execution of CDHS. Because models do not always accurately portray the results of hedge programs, the company shall, through back-testing and other means, assess the accuracy of the hedge modeling. The company shall determine a stochastic reserve as the weighted average of two CTE values; first, a CTE70 (“best efforts”) representing the company’s projection of all of the hedge cash flows, including future hedge purchases, and a second CTE70 (“adjusted”) which shall use only hedge assets held by the company on the valuation date and only future hedge purchases associated with indexed interest credited. These are discussed in greater detail in Section 9. The stochastic reserve shall be the weighted average of the two CTE70 values, where the weights reflect the error factor \((E)\) determined following the guidance of Section 9.C.4.

c) Consistent with Section 4.A.4.b.i., the index credit hedge margin for instruments associated with indexed interest credited shall be reflected by reducing hedge payoffs by a margin multiple as defined in Section 4.A.4.b.i.e).
The use of products not falling under the scope of these requirements (e.g., equity-indexed annuities) as a hedge shall not be recognized in the determination of accumulated deficiencies.

**Guidance Note:** Section 4.A.4.b.i is intended to address common situations for products with index crediting strategies where the company only hedges index credits or clearly separates index credit hedging from other hedging. In this case the hedge positions are considered similarly to other fixed income assets supporting the contracts, and a margin is reflected rather than modeling using a CTE70 adjusted run with no future hedge purchases. If a company has a more comprehensive hedge strategy combining index credits, guaranteed benefit, and other risks (e.g., full fair value or economic hedging), an appropriate and documented bifurcation method should be used in the application of sections 4.A.4.b.i and 4.A.4.b.ii above for the hedge modeling and justification. Such bifurcation methods may quantify the specific risk exposure attributable to index credit liabilities versus other liabilities such as guaranteed living benefits, and apply such for the basis for allocation.

**Guidance Note:** The requirements of Section 4.A.4 govern the determination of reserves for annuity contracts and do not supersede any statutes, laws or regulations of any state or jurisdiction related to the use of derivative instruments for hedging purposes and should not be used in determining whether a company is permitted to use such instruments in any state or jurisdiction.

5. Revenue Sharing

If applicable, projections of accumulated deficiencies may include income from projected future revenue sharing, net of applicable projected expenses (net revenue-sharing income) if each of the following requirements set forth in VM 21 Section 4.A.5 are met:

- The net revenue-sharing income is received by the company.
- Signed contractual agreement(s) are in place as of the valuation date and support the current payment of the net revenue-sharing income.
- The net revenue-sharing income is not already accounted for directly or indirectly as a company asset.

**Guidance Note:** For purposes of this section, net revenue-sharing income is considered to be received by the company if it is paid directly to the company through a contractual agreement with either the entity providing the net revenue-sharing income or an affiliated company that receives the net revenue-sharing income. Net revenue-sharing income also would be considered to be received if it is paid to a subsidiary that is owned by the company and if 100% of the statutory income from that subsidiary is reported as statutory income of the company. In this case, the company needs to assess the likelihood that future net revenue-sharing income is reduced due to the reported statutory income of the subsidiary being less than future net revenue-sharing income received.

Signed contractual agreement(s) are in place as of the valuation date and support the current payment of the net revenue-sharing income.

The net revenue-sharing income is not already accounted for directly or indirectly as a company asset.
The amount of net revenue-sharing income to be used shall reflect the company’s assessment of factors that include, but are not limited to, the following (not all of these factors will necessarily be present in all situations):

- The terms and limitations of the agreement(s), including anticipated revenue, associated expenses and any contingent payments incurred or made by either the company or the entity providing the net revenue sharing as part of the agreement(s).
- The relationship between the company and the entity providing the net revenue-sharing income that might affect the likelihood of payment and the level of expenses.
- The benefits and risks to both the company and the entity paying the net revenue-sharing income of continuing the arrangement.
- The likelihood that the company will collect the net revenue-sharing income during the term(s) of the agreement(s) and the likelihood of continuing to receive future revenue after the agreement(s) has ended.
- The ability of the company to replace the services provided to it by the entity providing the net revenue-sharing income or to provide the services itself, along with the likelihood that the replaced or provided services will cost more to provide.
- The ability of the entity providing the net revenue-sharing income to replace the services provided to it by the company or to provide the services itself, along with the likelihood that the replaced or provided services will cost more to provide.

The amount of projected net revenue-sharing income shall reflect a margin (which decreases the assumed net revenue-sharing income) directly related to the uncertainty of the revenue. The greater the uncertainty, the larger the margin. Such uncertainty is driven by many factors, including the potential for changes in the securities laws and regulations, mutual fund board responsibilities and actions, and industry trends. Since it is prudent to assume that uncertainty increases over time, a larger margin shall be applied as time that has elapsed in the projection increases.

All expenses required or assumed to be incurred by the company in conjunction with the arrangement providing the net revenue-sharing income, as well as any expenses assumed to be incurred by the company in conjunction with the assumed replacement of the services provided to it (as discussed in Section 4.A.5.b.v), shall be included in the projections as company expenses under the requirements of Section 4.A.1. In addition, expenses incurred by either the entity providing the net revenue-sharing income or an affiliate of the company shall be included in the applicable expenses discussed in Section 4.A.1 and Section 4.A.5.a that reduce the net revenue-sharing income.

The company is responsible for reviewing the revenue-sharing agreements and verifying compliance with these requirements.

The amount of net revenue-sharing income assumed in a given scenario shall not exceed the sum of (i) and (ii), where:
Is the contractually guaranteed net revenue-sharing income projected under the scenario; and

Is the company’s estimate of non-contractually guaranteed net revenue-sharing income before reflecting any margins for uncertainty multiplied by the following factors:

1.00 in the first projection year.
0.95 in the second projection year.
0.90 in the third projection year.
0.85 in the fourth projection year.
0.80 in the fifth and all subsequent projection years.

6. Length of Projections

Projections of accumulated deficiencies shall be run for as many future years as needed so that no materially greater reserve value would result from longer projection periods.

7. Interest Maintenance Reserve (IMR)

The IMR shall be handled consistently with the treatment in the company’s cash flow testing, and the amounts should be adjusted to a pre-tax basis.

B. Determination of Scenario Reserve

1. For a given scenario, the scenario reserve is the sum of:

   a) The starting asset amount plus the greatest present value, as of the projection start date, of the projected accumulated deficiencies; and

   Guidance Note: The greatest present value of accumulated deficiencies can be negative.

   b) The direct iteration method, where the scenario reserve is determined by solving for the amount of starting assets which, when projected along with all contract cash flows, result in the defeasement of all projected future benefits and expenses at the end of the projection horizon with no positive accumulated deficiencies at the end of any projection year during the projection period starting asset amount. When using the direct iteration method, the scenario reserve will equal the final starting asset amount determined according to Section 4.B.4.

The scenario reserve for any given scenario shall not be less than the cash surrender value in aggregate on the valuation date for the group of contracts modeled in the projection.

2. Discount Rates
In determining the scenario reserve, unless using the direct iteration method pursuant to Section 4.B.1.b, the accumulated deficiencies shall be discounted at the NAER on additional assets, as defined in Section 4.B.3.

3. Determination of NAER on Additional Invested Asset Portfolio

a. The additional invested asset portfolio for a scenario is a portfolio of general account assets as of the valuation date, outside of the starting asset portfolio, that is required in that projection scenario so that the projection would not have a positive accumulated deficiency at the end of any projection year. This portfolio may include only (i) General Account assets available to the company on the valuation date that do not constitute part of the starting asset portfolio; and (ii) cash assets.

Guidance Note:

Additional invested assets should be selected in a manner such that if the starting asset portfolio were revised to include the additional invested assets, the projection would not be expected to experience any positive accumulated deficiencies at the end of any projection year.

It is assumed that the accumulated deficiencies for this scenario projection are known.

b. To determine the NAER on additional invested assets for a given scenario:

i. Project the additional invested asset portfolio as of the valuation date to the end of the projection period,

   a) Investing any cash in the portfolio and reinvesting all investment proceeds using the company's investment policy.

   b) Excluding any liability cash flows.

   c) Incorporating the appropriate returns, defaults and investment expenses for the given scenario.

ii. If the value of the projected additional invested asset portfolio does not equal or exceed the accumulated deficiencies at the end of each projection year for the scenario, increase the size of the initial additional invested asset portfolio as of the valuation date, and repeat the preceding step.

   iii. Determine a vector of annual earned rates that replicates the growth in the additional invested asset portfolio from the valuation date to the end of the projection period for the scenario. This vector will be the NAER for the given scenario.

   iii-iv. If the depletion of assets within the projection results in an unreasonably high negative NAER upon borrowing, the NAER may be set to the assumed cost of borrowing associated with each projected time period, in accordance with Section 4.D.3.c, as a safe harbor.
Guidance Note: There are multiple ways to select the additional invested asset portfolio at the valuation date. Similarly, there are multiple ways to determine the earned rate vector. The company shall be consistent in its choice of methods, from one valuation to the next.

4. Direct Iteration In lieu of the method described in Section 4.B.2 and Section 4.B.3 above, the company may solve for the amount of starting assets which, when projected along with all contract cash flows, result in the defeasement of all projected future benefits and expenses at the end of the projection horizon with no accumulated deficiencies at the end of any projection year during the projection period.

C. Projection Scenarios

1. Number of Scenarios

The number of scenarios for which the scenario reserve shall be computed shall be the responsibility of the company, and it shall be considered to be sufficient if any resulting understatement in the stochastic reserve, as compared with that resulting from running additional scenarios, is not material.

2. Economic Scenario Generation

Treasury Department interest rate curves, as well as investment return paths for general account equity index funds, equities, and fixed income assets and separate account fund performance shall be determined on a stochastic basis using the methodology described in Section 8. If the company uses a proprietary generator to develop scenarios, the company shall demonstrate that the resulting scenarios meet the requirements described in Section 8.

D. Projection of Assets

1. Starting Asset Amount

a. For the projections of accumulated deficiencies, the value of assets at the start of the projection shall be set equal to the approximate value of statutory reserves at the start of the projection plus the allocated amount of PIMR attributable to the assets selected. Assets shall be valued consistently with their annual statement values. The amount of such asset values shall equal the sum of the following items, all as of the start of the projection:

i. All of the separate account assets supporting the contracts;

ii. Any hedge instruments held in support of the contracts being valued; and

iii. An amount of assets held in the general account equal to the approximate value of statutory reserves as of the start of the projections less the amount in (i) and (ii).

Guidance Note: Deferred hedge gains/losses developed under SSAP No. 108—Derivatives Hedging Variable Annuity Guarantees are not included in the starting assets.
b. If the amount of initial general account assets is negative, the model should reflect a projected interest expense. General account assets chosen for use as described above shall be selected on a consistent basis from one reserve valuation hereunder to the next.

To the extent that the sum of the value of hedge assets, or cash, or other general account assets in an amount equal to the aggregate market value of such hedge assets, and the value of separate account assets supporting the contracts is greater than the approximate value of statutory reserves as of the start of the projections, then the company shall include enough negative general account assets or cash such that the starting asset amount equals the approximate value of statutory reserves as of the start of the projections.

2. Valuation of Projected Assets

For purposes of determining the projected accumulated deficiencies, the value of projected assets shall be determined in a manner consistent with their value at the start of the projection. For assets assumed to be purchased during a projection, the value shall be determined in a manner consistent with the value of assets at the start of the projection that have similar investment characteristics. However, for derivative instruments that are used in hedging and are not assumed to be sold during a particular projection interval, the company may account for them at an amortized cost in an appropriate manner elected by the company.

Guidance Note: Accounting for hedge assets should recognize any methodology prescribed by a company’s state of domicile.

3. Separate Account Assets

For purposes of determining the starting asset amounts in Section 4.D.1 and the valuation of projected assets in Section 4.D.2, assets held in a separate account shall be summarized into asset categories determined by the company as discussed in Section 4.A.2.

4.3. General Account Assets

a. General account assets shall be projected, net of projected defaults, using assumed investment returns consistent with their book value and expected to be realized in future periods as of the date of valuation. Initial assets that mature during the projection and positive cash flows projected for future periods shall be invested in a manner that is representative of and consistent with the company’s investment policy, subject to the following requirements:

i. The final maturities and cash flow structures of assets purchased in the model, such as the patterns of gross investment income and principal repayments or a fixed or floating rate interest basis, shall be determined by the company as part of the model representation;

ii. The combination of price and structure for fixed income investments and derivative instruments associated with fixed income investments shall
appropriately reflect the projected Treasury Department curve along the
relevant scenario and the requirements for gross asset spread assumptions
stated below;

iii. For purchases of public non-callable corporate bonds, follow the
requirements defined in VM-20 Sections 7.E, 7.F and 9.F. The prescribed
spreads reflect current market conditions as of the model start date and
grade to long-term conditions based on historical data at the start of
projection year four;

iv. For transactions of derivative instruments associated with fixed income
investments, reflect the prescribed assumptions in VM-20 Section 9.F for
interest rate swap spreads;

v. For purchases of other fixed income investments, if included in the model
investment strategy, set assumed gross asset spreads over U.S. Treasuries
in a manner that is consistent with, and results in reasonable relationships
to, the prescribed spreads for public non-callable corporate bonds and
interest rate swaps.

b. Notwithstanding the above requirements, the model investment strategy and any
non-prescribed asset spreads shall be adjusted as necessary so that the aggregate
reserve is not less than that which would be obtained by substituting an alternative
investment strategy in which all fixed income reinvestment assets are public non-
callable corporate bonds with gross asset spreads, asset default costs, and
investment expenses by projection year that are consistent with a credit quality
blend of:

i. 5% Treasury

ii. 150% PBR credit rating 3 (Aa2/AA)

iii. 40% 6 (A2/A) and 50% PBR credit rating 63 (Aa2/AA)

iv. 40% PBR credit rating 9 (Baa/BBB)

Policy loans, equities and derivative instruments associated with the execution of
a clearly defined hedging strategy are not affected by this requirement.

Drafting Note: This limitation is being referred to Life Actuarial (A) Task Force for review.

b-c. Any disinvestment shall be modeled in a manner that is consistent with the
company’s investment policy and that reflects the company’s cost of borrowing
where applicable, provided that the assumed cost of borrowing is not lower than
the rate at which positive cash flows are reinvested in the same time period, taking
into account duration, ratings, and other attributes of the borrowing mechanism.
Gross asset spreads used in computing market values of assets sold in the model
shall be consistent with, but not necessarily the same as, the gross asset spreads in
Section 4.D.4.a.iii and Section 4.D.4.a.iv, recognizing that initial assets that mature
during the projection may have different characteristics than modeled reinvestment assets.

**Guidance Note:** This limitation is being referred to Life Actuarial (A) Task Force for review. The simple language above “provided that the assumed cost of borrowing is not lower than the rate at which positive cash flows are reinvested in the same time period” is not intended to impose a literal requirement. It is intended to reflect a general concept to prevent excessively optimistic borrowing assumptions. It is recognized that borrowing parameters and rules can be complicated, such that modeling limitations may not allow for literal compliance, in every time step, as long as the reserve is not materially affected. However, if the company is unable to fully apply this restriction, prudence dictates that a company shall not allow borrowing assumptions to materially reduce the reserve.

§-A.5  Cash Flows from Invested Assets

a. Cash flows from general account fixed income assets, including starting and reinvestment assets, shall be reflected in the projection as follows:

i. Model gross investment income and principal repayments in accordance with the contractual provisions of each asset and in a manner consistent with each scenario.

ii. Reflect asset default costs as prescribed in VM-20 Section 9.F and anticipated investment expenses through deductions to the gross investment income.

iii. Model the proceeds arising from modeled asset sales and determine the portion representing any realized capital gains and losses.

iv. Reflect any uncertainty in the timing and amounts of asset cash flows related to the paths of interest rates, equity returns or other economic values directly in the projection of asset cash flows. Asset defaults are not subject to this requirement, since asset default assumptions must be determined by the prescribed method in VM-20 Sections 7.E, 7.F and 9.F.

b. Cash flows from general account index funds and equity assets—i.e., non-fixed income assets having substantial volatility of returns, such as common stocks and real estate— including starting and reinvestment assets, shall be reflected in the projection as follows:

i. Determine the grouping for asset categories and the allocation of specific assets to each category in a manner that is consistent with that used for separate account assets index crediting strategies, as discussed in Section 4.A.2.

ii. Project the gross investment return including realized and unrealized capital gains in a manner that is consistent with the stochastically generated scenarios.
Model the timing of an asset sale in a manner that is consistent with the investment policy of the company for that type of asset. Reflect expenses through a deduction to the gross investment return using prudent estimate assumptions.

c. Cash flows for each projection interval for policy loan assets shall follow the requirements in Section 10.I.

E. Projection of Annuity Benefits (Including GMIBs and GMWBs)

1. Assumed Annuity Purchase Rates at Election

a. For payouts specified at issue (such as single premium immediate annuities, deferred income annuities, and certain structured settlements), such payout rates shall reflect the payout rate specified in the contract.

b. For purposes of projecting future elective annuitization benefits (including annuitizations stemming from the election of a GMIB) and withdrawal amounts from GMWBs, the projected annuitization purchase rates shall be determined assuming that market interest rates available at the time of election are the interest rates used to project general account assets, as determined in Section 4.D.4. In contrast, for payouts specified at issue, the payout rates modeled should be consistent with those specified in the contract.

2. Projected Election of GMIBs, GMWBs and Other Annuity Options

a. For contracts projected to elect future annuitization options (including annuitizations stemming from the election of a GMIB) or for projections of GMWB benefits once the account value has been depleted, the projections may assume one of the following at the company’s option:

   The contract is treated as if surrendered at an amount equal to the statutory reserve that would be required at such time for a fixed payout annuity benefit equivalent to the guaranteed benefit amount (e.g., GMIB or GMWB benefit payments)

   The contract is assumed to will stay in force, and the projected periodic payments are paid, and the associated maintenance expenses are incurred.

b. Where mortality improvement is used to project future annuitization purchase rates, as discussed in Section 4.E.1 above, mortality improvement also shall be reflected on a consistent basis in either the determination of the reserve in Section 4.E.2.a.i above or the projection of the periodic payments in Section 4.E.2.a.ii.

3. Projected Statutory Reserve for Payout Annuity Benefits

If the statutory reserve for payout annuity benefits referenced above in Section 4.E.2.a requires a parameter that is not determined in a formulaic fashion, the company must make a reasonable and supportable assumption regarding this parameter.
F. Frequency of Projection and Time Horizon

1. Use of an annual cash-flow frequency (“timestep”) is generally acceptable for benefits/features that are not sensitive to projection frequency. The lack of sensitivity to projection frequency should be validated by testing wherein the company should determine that the use of a more frequent—i.e., shorter—time step does not materially increase reserves. A more frequent time increment should always be used when the product features are sensitive to projection period frequency.

2. Care must be taken in simulating fee income and expenses when using an annual time step. For example, recognizing fee income at the end of each period after market movements, but prior to persistency decrements, would normally be an inappropriate assumption. It is also important that the frequency of the investment return model be linked appropriately to the projection horizon in the liability model. In particular, the horizon should be sufficiently long so as to capture the vast majority of costs (on a present value basis) from the scenarios.

**Guidance Note:** As a general guide, the forecast horizon should not be less than 20 years.

G. Compliance with ASOPs

When determining a stochastic reserve, the analysis shall conform to the ASOPs as promulgated from time to time by the ASB.

Under these requirements, an actuary will make various determinations, verifications and certifications. The company shall provide the actuary with the necessary information sufficient to permit the actuary to fulfill the responsibilities set forth in these requirements and responsibilities arising from each applicable ASOP.
Section 5: Reinsurance Ceded and Assumed

Drafting Note: All revisions shown in this section are in comparison to Section 5 in VM-21.

A. Treatment of Reinsurance Ceded in the Aggregate Reserve

1. Aggregate Reserve Pre- and Post-Reinsurance Ceded

As noted in Section 3.B, the aggregate reserve is determined both pre-reinsurance ceded and post-reinsurance ceded. Therefore, it is necessary to determine the components needed to determine the aggregate reserve—i.e., the additional standard projection amount, the stochastic reserve determined using projections, and/or the reserve amount valued using requirements in VM-A and VM-C determined using the Alternative Methodology, as applicable—on both bases. Sections 5.A.2 and through 5.A.34 discuss adjustments to inputs necessary to determine these components on both a post-reinsurance ceded and a pre-reinsurance ceded basis. Note that due allowance for reasonable approximations may be used where appropriate.

2. Stochastic Reserve

a. In order to determine the aggregate reserve post-reinsurance ceded, accumulated deficiencies, scenario reserves, and the resulting stochastic reserve shall be determined reflecting the effects of reinsurance treaties that meet the statutory requirements that would allow the treaty to be accounted for as reinsurance within statutory accounting. This involves including, where appropriate, all anticipated projected reinsurance premiums or other costs and all reinsurance recoveries, where the reinsurance cash flows reflect all the provisions in the reinsurance agreement, using prudent estimate assumptions both premiums and recoveries are determined by recognizing any limitations in the reinsurance treaties, such as caps on recoveries or floors on premiums.

i. All significant terms and provisions within reinsurance treaties shall be reflected. In addition, it shall be assumed that each party is knowledgeable about the treaty provisions and will exercise them to their advantage.

Guidance Note: Renegotiation of the treaty upon the expiration of an experience refund provision or at any other time shall not be assumed if such would be beneficial to the company and not beneficial to the counterparty. This is applicable to both the ceding party and assuming party within a reinsurance arrangement.

ii. If the company has knowledge that a counterparty is financially impaired, the company shall establish a margin for the risk of default by the counterparty. In the absence of knowledge that the counterparty is financially impaired, the company is not required to establish a margin for the risk of default by the counterparty.

i.iii. A company shall include the cash flows from a reinsurance agreement or amendment in calculating the aggregate reserve if such qualifies for credit in compliance with Appendix A-791 of the Accounting Practices and Procedures Manual. If a reinsurance agreement or amendment does not qualify for credit for reinsurance but treating the reinsurance agreement or amendment as if it did so qualify would result in a reduction to the company’s surplus, then the company shall increase the minimum reserve by the absolute value of such reductions in surplus.
b. In order to determine the stochastic reserve on a pre-reinsurance ceded basis, accumulated deficiencies, scenario reserves, and the resulting stochastic reserve shall be determined ignoring the effects of reinsurance ceded within the projections. Different approaches may be used to determine the starting assets on the ceded portion of the contracts, dependent upon the characteristics of a given treaty:

i. For a standard coinsurance treaty, where the assets supporting the ceded liabilities were transferred to the assuming reinsurer, one acceptable approach involves a projection based on using the same starting assets on the ceded portion of the policies that are similar to those supporting the retained portion of the ceded policies or supporting similar types of policies. Scaling up each asset supporting the retained portion of the contract is also an acceptable method amount as for the aggregate reserve post reinsurance ceded and by ignoring, where appropriate, all anticipated reinsurance premiums or other costs and all reinsurance recoveries in the projections.

Guidance Note: For standard pro rata insurance treaties (does not include experience refunds), where allocated expenses are similar to the renewal expense allowance, reflecting the quota share applied to the present value of future reinsurance cash flows pertaining to the reinsured block of business may be considered as a possible approach to determine the ceded reserves.

ii. Alternatively, a treaty may contain an identifiable portfolio of assets associated with the ceded liabilities. This could be the case for several forms of reinsurance: funds withheld coinsurance; modified coinsurance; coinsurance with a trust. To the extent these assets would be available to the cedant, an acceptable approach could involve modeling this portfolio of assets. To the extent that these assets were insufficient to defease the ceded liabilities, the modeling would partially default to the approach discussed for a standard coinsurance treaty. To the extent these assets exceeded what might be needed to defease the ceded liabilities (perhaps an over collateralization requirement in a trust), the inclusion of such assets shall be limited.

Guidance Note: Section 3.5.2 in ASOP No. 52, Principle-Based Reserves for Life Products under the NAIC Valuation Manual, provides possible methods for constructing a hypothetical pre-reinsurance asset portfolio, if necessary, for purposes of the pre-reinsurance reserve calculation.

c. An assuming company shall use assumptions to project cash flows to and from ceding companies that reflect the assuming company’s experience for the business segment to which the reinsured policies belong and reflect the terms of the reinsurance agreement.

3. Reserve Determined Upon Passing the Exclusion Test using the Alternative Methodology

If a company passes chooses to use the Alternative Methodology stochastic exclusion test and elects to use a methodology pursuant to applicable Sections VM-A and VM-C, as allowed in Section 3.E, it is important to note that the methodology produces reserves on a pre-reinsurance ceded basis. Therefore, where reinsurance is ceded, the Alternative Methodology reserve must be modified to reflect the reinsurance costs and reinsurance recoveries under the reinsurance treaties in the determination of the aggregate reserve post reinsurance ceded adjusted for any reinsurance ceded accordingly. In addition, the reserves valued under applicable Sections in VM-A and VM-C, the Alternative Methodology, unadjusted for reinsurance, shall be applied to the contracts falling under the scope of these requirements to determine the aggregate reserve prior to reinsurance.

It should be noted that the pre-reinsurance and post-reinsurance reserves may result in different outcomes for the exclusion test. In particular, it is possible that the pre-reinsurance reserves would pass the relevant exclusion test (and allow the use of VM-A and VM-C) while the post-reinsurance reserves might not.
4. **To Be Determined** Additional Standard Projection Amount

Where reinsurance is ceded, the additional standard projection amount shall be calculated as described in Section 6 to reflect the reinsurance costs and reinsurance recoveries under the reinsurance treaties. The additional standard projection amount shall also be calculated pre-reinsurance ceded using the methods described in Section 6 but ignoring the effects of the reinsurance ceded.
Section 7: Exclusion Testing

Drafting Note: All revisions shown in this section are in comparison to Section 6 in VM-20.

A. Stochastic Exclusion Test Requirement Overview

1. Requirements to pass the Stochastic Exclusion Test:

   a. If the company does not elect to calculate the SET for one or more groups of contracts, or the company calculates the SET and fails the test for such groups of contracts, the reserve methodology described in Section 4 shall be used for calculating the aggregate reserve for those groups of contracts.

   b. If the company elects to calculate the SET for one or more groups of contracts, and passes the test for such groups of contracts, then the company shall choose whether or not to use the reserve methodology described in Section 4 for those groups of contracts. If the reserve methodology described in Section 4 is not used for one or more groups of contracts, then the company shall use the reserve methodology pursuant to applicable requirements in VM-A and VM-C to calculate the aggregate reserve for those groups of contracts.

   c. A company may not exclude a group of contracts from the stochastic reserve requirements if there are one or more future hedging programs associated with the contracts, with the exception of hedging programs solely supporting index credits as described in Section 9.A.1.

B. Types of Stochastic Exclusion Tests

Groups of contracts pass the SET if one of the following is met:

1. Stochastic Exclusion Ratio Test (SERT) — Annually and within 12 months before the valuation date the company demonstrates that the groups of contracts policies pass the SERT defined in Section 7.C6.A.2.

2. Stochastic Exclusion Demonstration Test — In the first year and at least once every three calendar years thereafter, the company provides a demonstration in the PBR Actuarial Report as specified in Section 7.D6.A.3.

3. SET Certification Method — For groups of contracts policies other than variable life that do not have guaranteed living benefits, future hedging programs, or ULSG pension risk transfer business in the first year and at least every third calendar year thereafter, the company provides a certification by a qualified actuary that the group of contracts policies is not subject to material aggregate risk levels across interest rate risk, longevity risk, or asset return volatility risk (i.e., the risk on non-fixed-income investments having substantial volatility of returns, such as common stocks and real estate investments). The company shall provide the certification and documentation supporting the certification to the commissioner upon request.

Guidance Note: The qualified actuary should develop documentation to support the actuarial certification that presents his or her analysis clearly and in detail sufficient for another actuary to...
understand the analysis and reasons for the actuary’s conclusion that the group of policies is not subject to material interest rate risk, longevity risk, or asset return volatility risk. Examples of methods a qualified actuary could use to support the actuarial certification include, but are not limited to:

a) A demonstration that the requirements under VM-A and VM-C for the group of policies calculated according to Section 3 are at least as great as the assets required to support the group of policies using the company’s cash-flow testing model under each of the 16 scenarios identified in Section 6 or alternatively each of the New York seven scenarios.

b) A demonstration that the group of policies passed the SERT within 36 months prior to the valuation date and the company has not had a material change in its interest rate risk.

c) A qualitative risk assessment of the group of policies that concludes that the group of policies does not have material interest rate risk or asset return volatility. Such assessment would include an analysis of product guarantees, the company’s non-guaranteed elements (NGEs) policy, assets backing the group of policies and the company’s investment strategy.

C. Stochastic Exclusion Ratio Test

1. In order to exclude a group of policies from the stochastic reserve requirements using the method allowed under Section 6.A.1.a, the stochastic exclusion ratio test (SERT), a company shall demonstrate that the ratio of (b-a)/ca is less than 6% where:

   a. a = the adjusted deterministic scenario reserve described in Section 6.A.2.b.ii below using economic scenario 9, the baseline economic scenario, as described in Appendix 1.E of VM-20.

   b. b = the largest adjusted scenario reserve described in Section 6.A.2.b.ii Paragraph C.2.b below under any of the other 15 economic scenarios described in Appendix 1.E of VM-20 under both [95]% and [105]% of anticipated experience mortality excluding margins.

   iii. c = an amount calculated from the baseline economic scenario described in Appendix 1.E that represents the present value of benefits for the policies, adjusted for reinsurance by subtracting ceded benefits. For clarity, premium, ceded premium, expense, reinsurance expense allowance, modified coinsurance reserve adjustment and reinsurance experience refund cash flows shall not be considered “benefits,” but items such as death benefits, surrender or withdrawal benefits and policyholder dividends shall be. For this purpose, the company shall use the benefits cash flows from the calculation of quantity “a” and calculate the present value of those cash flows using the same path of discount rates as used for “a.”

Guidance Note: Note that the numerator should be the largest adjusted DR scenario reserve for scenarios other than the baseline economic scenario, minus the adjusted DR scenario reserve for
the baseline economic scenario. This is not necessarily the same as the biggest difference from the adjusted DR scenario reserve for the baseline economic scenario, or the absolute value of the biggest difference from the adjusted DR scenario reserve for the baseline economic scenario, both of which could lead to an incorrect test result.

2. In calculating the ratio in Section 6.A.2. subsection (1) above:

   a. The company shall calculate an adjusted deterministic scenario reserve for the group of contracts for each of the 16 scenarios that is equal to either (ai) or (bii) below:

   i. The deterministic scenario reserve defined in Section 4.A, but with the following differences:

      a) Using anticipated experience assumptions with no margins, with the exception of mortality factors described in Paragraph C.1.b of this section.

      b) Using the interest rates and equity return assumptions specific to each scenario.

      c) Using NAER and discount rates defined in Section 7.H4 specific to each scenario to discount the cash flows.

      d) Shall reflect future mortality improvement in line with anticipated experience assumptions.

      e) Shall not reflect correlation between longevity and economic risks.

   ii. The gross premium reserve developed from the cash flows from the company’s asset adequacy analysis models, using the experience assumptions of the company’s cash-flow analysis, but with the following differences:

      a) Using the interest rates and equity return assumptions specific to each scenario.

      b) Using the mortality scalars described in Paragraph C.1.b of this section.

      c) Using the methodology to determine NAER and discount rates defined in Section 7.H4 specific to each scenario to discount the cash flows, but using the company’s cash-flow testing assumptions for default costs and reinvestment earnings.

   b. The company shall use the most current available baseline economic scenario and the 16 economic scenarios published by the NAIC. The methodology for creating these scenarios can be found in Appendix 1 of VM-20.

   c. The company shall use assumptions within each scenario that are dynamically adjusted as appropriate for consistency with each tested scenario.

   d. The company may not group together contract types with significantly different risk profiles for purposes of calculating this ratio.
e. Mortality improvement beyond the projection start date may not be reflected in the mortality assumption for the purpose of calculating the stochastic exclusion ratio.

e. If the company has reinsurance arrangements that are pro rata coinsurance and do not materially impact the interest rate risk, longevity risk, or asset return volatility in the contract, then the company may elect to not conduct the exclusion test under a pre-reinsurance-ceded basis upon determining the pre-reinsurance reserve-ceded aggregate reserve.

3. If the ratio calculated in Section 6.A.2.a above is less than 6% pre-YRT non-proportional reinsurance, but is greater than 6% post-YRT non-proportional reinsurance, the group of contracts/policies will still pass the SERT if the company can demonstrate that the sensitivity of the adjusted deterministic scenario reserve to economic scenarios is comparable pre- and post-YRT non-proportional reinsurance.

a. An example of an acceptable demonstration:

i. For convenience in notation • SERT = the ratio \((b-a)/a\) defined in Section 7.C.1(a) above

a) The pre-YRT non-proportional reinsurance results are “gross of YRT non-proportional,” with a subscript “\(\text{gy}\),” so denoted \(SERT_{\text{gy}}\).

b) The post-YRT non-proportional results are “net of YRT non-proportional,” with subscript “\(\text{ny}\),” so denoted \(SERT_{\text{ny}}\).

ii. If a block of business being tested is subject to one or more YRT non-proportional reinsurance cessions as well as other forms of reinsurance, such as pro rata coinsurance, take “gross of YRT non-proportional” to mean net of all non-YRT pro rata reinsurance but ignoring the YRT non-proportional contract(s), and “net of YRT non-proportional” to mean net of all reinsurance contracts. That is, treat YRT non-proportional reinsurance as the last reinsurance in, and compute certain values below with and without that last component.

iii. So, if \(SERT_{\text{gy}} < 0.060, SERT_{\text{gn}} < [x]\) but \(SERT_{\text{ny}} > 0.060, SERT_{\text{nn}} > [x]\), then compute the largest percent increase in reserve \(\text{LPIR} = (b-a)/a\), both “gross of YRT non-proportional” and “net of YRT non-proportional.”

\[
\text{LPIR}_{\text{gy}} = \frac{(b_{\text{gy}} - a_{\text{gy}}) / a_{\text{gy}}}{a_{\text{gy}}} \\
\text{LPIR}_{\text{ny}} = \frac{(b_{\text{ny}} - a_{\text{ny}}) / a_{\text{ny}}}{a_{\text{ny}}}
\]

Note that the scenario underlying \(b_{\text{gy}}\) could be different from the scenario underlying \(b_{\text{gy}}\).

If \(SERT_{\text{gy}} \times \text{LPIR}_{\text{gy}} / \text{LPIR}_{\text{ny}} < 0.060, SERT_{\text{gn}} \times \text{LPIR}_{\text{gn}} / \text{LPIR}_{\text{nn}} < [x]\), then the block of contracts/policies passes the SERT.
b. Another more qualitative approach is to calculate the adjusted deterministic scenario reserves for the 16 scenarios both gross and net of reinsurance to demonstrate that there is a similar pattern of sensitivity by scenario.

4. The SERT may not be used for a group of contracts if, using the current year’s data, (i) the stochastic exclusion demonstration test defined in Section 7.D had already been attempted using the method of Section 6.A.3.b.i or Section 6.A.3.b.ii in this section and did not pass; or (ii) the qualified actuary had actively undertaken to perform the certification method of Section 6.A.1.a.iii in this section and concluded that such certification could not legitimately be made.

D. Stochastic Exclusion Demonstration Test

1. In order to exclude a group of contracts from the stochastic reserve requirements using the methodology as allowed under Section 6.A.1.a.ii above in this section, the company must provide a demonstration in the PBR Actuarial Report in the first year and at least once every three calendar years thereafter that complies with the following:

a. The demonstration shall provide a reasonable assurance that if the stochastic reserve was calculated on a stand-alone basis for the group of contracts subject to the stochastic reserve exclusion, the resulting stochastic minimum reserve for those groups of policies contracts would not be higher than the statutory reserve determined pursuant to the applicable requirements in VM-A and VM-C increase. The demonstration shall take into account whether changing conditions over the current and two subsequent calendar years would be likely to change the conclusion to exclude the group of policies contracts from the stochastic reserve requirements.

b. If, as of the end of any calendar year, the company determines the minimum aggregate reserve for the group of policies contracts no longer adequately provides for all material risks, the exclusion shall be discontinued, and the company fails the SERT for those policies contracts.

c. The demonstration may be based on analysis from a date that precedes the valuation date for the initial year to which it applies if the demonstration includes an explanation of why the use of such a date will not produce a material change in the outcome, as compared to results based on an analysis as of the valuation date.

d. The demonstration shall provide an effective evaluation of the residual risk exposure remaining after risk mitigation techniques, such as derivative programs and reinsurance.

2. The company may use one of the following or another method acceptable to the insurance commissioner to demonstrate compliance with Section 6.A.3.a subsection 7.D.1 above:

a. Demonstrate that the statutory reserve calculated in accordance with VM-A and VM-C greater of [the quantity A and the quantity B] is greater than the stochastic reserve calculated on a stand-alone basis, where:
A = the deterministic reserve, and

B = the NPR less any associated due and deferred premium asset.

bii. Demonstrate that the statutory reserve calculated in accordance with VM-A and VM-

\[ \text{greater of \{the quantity } A \text{ and the quantity } B \} \] is greater than the scenario reserve

that results from each of a sufficient number of adverse deterministic scenarios, where:

A = the deterministic reserve, and

B = the NPR less any associated due and deferred premium asset.

c. Demonstrate that the statutory reserve calculated in accordance with VM-A and VM-

\[ \text{greater of \{the quantity } A \text{ and the quantity } B \} \] is greater than the stochastic reserve

calculated on a stand-alone basis, but using a representative sample of

contracts/policies in the stochastic reserve calculations, where:

A = the deterministic reserve, and

B = the NPR less any associated due and deferred premium asset.

d. Demonstrate that any risk characteristics that would otherwise cause the stochastic

reserve calculated on a stand-alone basis to exceed greater of the deterministic

reserve and the NPR, less any associated due and deferred premium asset the statutory

reserve calculated in accordance with VM-A and VM-C, are not present or have been

substantially eliminated through actions such as hedging, investment strategy,

reinsurance or passing the risk on to the policyholder by contract provision.

E. Deterministic Certification Option

1. The company has the option to determine the stochastic reserve for a group of

contracts using a single deterministic economic scenario, subject to the following

conditions.

a. The company certifies that economic conditions do not materially influence

anticipated contract holder behavior for the group of policies. Examples of

contract holder options that are materially influenced by economic conditions

include surrender benefits, recurring premium payments, and guaranteed living

benefits.

b. The company certifies that the group of policies is not supported by a

reinvestment strategy that contains future hedge purchases.

c. The company must perform and disclose results from the stochastic exclusion

ratio test following the requirements in Section 7.C, thereby disclosing the

scenario reserve volatility across various economic scenarios.

d. The company must disclose a description of contracts and associated features in

the certification.
2. The stochastic reserve for the group of contracts under the Deterministic Certification Option is determined as follows:

   a. Cash flows are projected in compliance with the applicable requirements in Section 4, Section 5, Section 10, and Section 11 of VM-22 over a single economic scenario (scenario 12 found in Appendix 1 of VM-20).

   b. The stochastic reserve equals the scenario reserve following the requirements for Section 4.

Guidance Note: The Deterministic Certification Option is intended to provide a non-stochastic option for Single Premium Immediate Annuities (SPIAs) and similar payout annuity products that contain limited or no optionality in the asset and liability cash flow projections.
Section 9: Modeling Hedges under a Future Hedging Strategy

Drafting Note: All revisions shown in this section are in comparison to Section 9 in VM-21.

A. Initial Considerations

1. This section applies to modeling of hedges other than situations where the company (a) only hedges index credits, or (b) clearly separates index credit hedging from other hedging. In those situations, the modeling of hedges supporting index credits can be simplified including applying an index credit hedge margin, following the requirements in Section 4.A.4.b.i.

2. Subject to Section 9.C.2., the appropriate costs and benefits of hedging instruments that are currently held by the company in support of the contracts falling under the scope of these requirements shall be included in the calculation of the stochastic reserve, determined in accordance with Section 3.D and Section 4.D.

3. If the company is following a CDHS, in accordance with an investment policy adopted by the board of directors, or a committee of board members, the company shall take into account the costs and benefits of hedge positions expected to be held by the company in the future along each scenario based on the execution of the hedging strategy, and it is eligible to reduce the amount of the stochastic reserve using projections otherwise calculated. The investment policy must clearly articulate the company’s hedging objectives, including the metrics that drive rebalancing/trading. This specification could include maximum tolerable values for investment losses, earnings, volatility, exposure, etc. in either absolute or relative terms over one or more investment horizons vis-à-vis the chance of occurrence. Company management is responsible for developing, documenting, executing and evaluating the investment strategy for future hedge purchases. Prior to reflection in projections, the strategy for future hedge purposes shall be the actual practice of the company for a period of time not less than [6] months. including the hedging strategy, used to implement the investment policy.

4. For this purpose, the investment assets refer to all the assets, including derivatives supporting covered products and guarantees. This also is referred to as the investment portfolio. The investment strategy is the set of all asset holdings at all points in time in all scenarios. The hedging portfolio, which also is referred to as the hedging assets, is a subset of the investment assets. The hedging strategy is the hedging asset holdings at all points in time in all scenarios. There is no attempt to distinguish what is the hedging portfolio and what is the investment portfolio in this section. Nor is the distinction between investment strategy and hedging strategy formally made here. Where necessary to give effect to the intent of this section, the requirements applicable to the hedging portfolio or the hedging strategy are to apply to the overall investment portfolio and investment strategy.

5. This particularly applies to restrictions on the reasonableness or acceptability of the models that make up the stochastic cash-flow model used to perform the projections, since these restrictions are inherently restrictions on the joint modeling of the hedging and non-hedging portfolio. To give effect to these requirements, they must apply to the overall investment strategy and investment portfolio. Before either a new or revised hedging strategy can be used to reduce the amount of the stochastic reserve otherwise calculated, the hedging strategy should be in place (i.e., effectively implemented by the company) for at least three months. The company may meet the time requirement by having evaluated...
the effective implementation of the hedging strategy for at least three months without actually having executed the trades indicated by the hedging strategy (e.g., mock testing or by having effectively implemented the strategy with similar annuity products for at least three months).

B. Modeling Approaches

1. The analysis of the impact of the hedging strategy on cash flows is typically performed using either one of two types of methods as described below. Although a hedging strategy normally would be expected to reduce risk provisions, the nature of the hedging strategy and the costs to implement the strategy may result in an increase in the amount of the stochastic reserve otherwise calculated.

2. The fundamental characteristic of the first type of method, referred to as the “explicit method,” is that hedging positions and their resulting cash flows are included in the stochastic cash-flow model used to determine the scenario reserve, as discussed in Section 3.D, for each scenario.

3. The fundamental characteristic of the second type of method, referred to as the “implicit method,” is that the effectiveness of the current hedging strategy on future cash flows is evaluated, in part or in whole, outside of the stochastic cash-flow model. There are multiple ways that this type of modeling can be implemented. In this case, the reduction to the stochastic reserve otherwise calculated should be commensurate with the degree of effectiveness of the hedging strategy in reducing accumulated deficiencies otherwise calculated.

4. Regardless of the methodology used by the company, the ultimate effect of the current hedging strategy (including currently held hedge positions) on the stochastic reserve needs to recognize all risks, associated costs, imperfections in the hedges and hedging mismatch tolerances associated with the hedging strategy. The risks include, but are not limited to: basis, gap, price, parameter estimation and variation in assumptions (mortality, persistency, withdrawal, annuitization, etc.). Costs include, but are not limited to: transaction, margin (opportunity costs associated with margin requirements) and administration. In addition, the reduction to the stochastic reserve attributable to the hedging strategy may need to be limited due to the uncertainty associated with the company’s ability to implement the hedging strategy in a timely and effective manner. The level of operational uncertainty varies indirectly with the amount of time that the new or revised strategy has been in effect or mock tested.

Guidance Note: No hedging strategy is perfect. A given hedging strategy may eliminate or reduce some but not all risks, transform some risks into others, introduce new risks, or have other imperfections. For example, a delta-only hedging strategy does not adequately hedge the risks measured by the “Greeks” other than delta. Another example is that financial indices underlying typical hedging instruments typically do not perform exactly like the separate account funds, and hence the use of hedging instruments has the potential for introducing basis risk.

5. A safe harbor approach is permitted for CDHS reflection for those companies whose modeled hedge assets comprise only linear instruments not sensitive to implied volatility. For companies with option-based hedge strategies, electing this approach would require representing the option-based portion of the strategy as a delta-rho two-Greek hedge program. The normally modeled option portfolio would be replaced with a set of linear instruments that have the same first-order Greeks as the original option portfolio.
C. Calculation of Stochastic Reserve (Reported)

1. The company shall calculate CTE70 (best efforts)—the results obtained when the CTE70 is based on incorporating the CDHS modeling of hedges (including both currently held and future hedge positions) into the stochastic cash-flow model on a best efforts basis, including all of the factors and assumptions needed to execute the CDHS model the hedges (e.g., stochastic implied volatility). The determination of CTE70 (best efforts) may utilize either explicit or implicit modeling techniques.

2. The company shall calculate a CTE70 (adjusted) by recalculating the CTE70 assuming the company has no CDHS hedging strategy except those to hedge interest credits and hedge assets held by the company on the valuation date, therefore following the requirements of Section 4.A.4.a and 4.A.4.b.i.

3. Because most models will include at least some approximations or idealistic assumptions, CTE70 (best efforts) may overstate the impact of the hedging strategy. To compensate for potential overstatement of the impact of the hedging strategy, the value for the stochastic reserve is given by:

\[
\text{Stochastic reserve} = \text{CTE70 (best efforts)} + E \times \max[0, \text{CTE70 (adjusted)} - \text{CTE70 (best efforts)}]
\]

4. The company shall specify a value for \(E\) (the “error factor”) in the range from 5% to 100% to reflect the company’s view of the potential error resulting from the level of sophistication of the stochastic cash-flow model and its ability to properly reflect the parameters of the hedging strategy (i.e., the Greeks being covered by the strategy), as well as the associated costs, risks and benefits. The greater the ability of the stochastic model to capture all risks and uncertainties, the lower the value of \(E\). The value of \(E\) may be as low as 5% only if the model used to determine the CTE70 (best efforts) effectively reflects all of the parameters used in the hedging strategy. If certain economic risks are not hedged, yet the model does not generate scenarios that sufficiently capture those risks, \(E\) must be in the higher end of the range, reflecting the greater likelihood of error. Likewise, simplistic hedge cash-flow models shall assume a higher likelihood of error.

5. The company shall conduct a formal back-test, based on an analysis of at least the most recent 12 months, to assess how well the model is able to replicate the hedging strategy in a way that supports the determination of the value used for \(E\).

6. Such a back-test shall involve one of the following analyses:

a. For companies that model hedge cash flows directly (“explicit method”), replace the stochastic scenarios used in calculating the CTE70 (best efforts) with a single scenario that represents the market path that actually manifested over the selected back-testing period and compare the projected hedge asset gains and losses against the actual hedge asset gains and losses—both realized and unrealized—observed over the same time period. For this calculation, the model assumptions may be replaced with parameters that reflect actual experience during the back-testing period. In order to isolate the comparison between the modeled hedge results and actual hedge results for this calculation, the projected liabilities should accurately reflect the actual liabilities throughout the back-testing period; therefore, adjustments that facilitate this accuracy (e.g. reflecting actual experience instead of model assumptions, including new business, etc.) are permissible.
To support the choice of a low value of $E$, the company should ascertain that the projected hedge asset gains and losses are within close range of 100% (e.g., 80–125%) of the actual hedge asset gains and losses. The company may also support the choice of a low value of $E$ by achieving a high R-squared (e.g., 0.80 or higher) when using a regression analysis technique.

b. For companies that model hedge cash flows implicitly by quantifying the cost and benefit of hedging using the fair value of the hedged item (an “implicit method” or “cost of reinsurance method”), calculate the delta, rho and vega coverage ratios in each month over the selected back-testing period in the following manner:

i. Determine the hedge asset gains and losses—both realized and unrealized—incurred over the month attributable to equity, interest rate, and implied volatility movements.

ii. Determine the change in the fair value of the hedged item over the month attributable to equity, interest rate, and implied volatility movements. The hedged item should be defined in a manner that reflects the proportion of risks hedged (e.g., if a company elects to hedge 50% of a contract’s market risks, it should quantify the fair value of the hedged item as 50% of the fair value of the contract).

iii. Calculate the delta coverage ratio as the ratio between (i) and (ii) attributable to equity movements.

iv. Calculate the rho coverage ratio as the ratio between (i) and (ii) attributable to interest rate movements.

v. Calculate the vega coverage ratio as the ratio between (i) and (ii) attributable to implied volatility movements.

vi. To support the company’s choice of a low value of $E$, the company should be able to demonstrate that the delta and rho coverage ratios are both within close range of 100% (e.g., 80–125%) consistently across the back-testing period.

vii. In addition, the company should be able to demonstrate that the vega coverage ratio is within close range of 100% in order to use the prevailing implied volatility levels as of the valuation date in quantifying the fair value of the hedged item for the purpose of calculating CTE70 (best efforts). Otherwise, the company shall quantify the fair value of the hedged item for the purpose of calculating CTE70 (best efforts) in a manner consistent with the realized volatility of the scenarios captured in the CTE (best efforts).

c. Companies that do not model hedge cash flows explicitly, but that also do not use the implicit method as outlined in Section 9.C.6.b above, shall conduct the formal back-test in a manner that allows the company to clearly illustrate the appropriateness of the selected method for reflecting the cost and benefit of hedging, as well as the value used for $E$.

7. A company that does not have 12 months of experience to date shall set $E$ to a value that reflects the amount of experience available, and the degree and nature of any change to the hedge program. For a material change in strategy, with no history, $E$ should be at least 0.50.
However, E may be lower than 0.50 if some reliable experience is available and/or if the change in strategy is a refinement rather than a substantial change in strategy.

**Guidance Note:** The following examples are provided as guidance for determining the E factor when there has been a change to the hedge program:

- The error factor should be temporarily large (e.g., ≥ 50%) for substantial changes in hedge methodology (e.g., moving from a fair-value based strategy to a stop-loss strategy) where the company has not been able to provide a meaningful simulation of hedge performance based on the new strategy.
- A temporary moderate increase (e.g., 15–30%) in error factor should be used for substantial modifications to hedge programs or CDHS modeling where meaningful simulation has not been created (e.g., adding second-order hedging, such as gamma or rate convexity).
- No increase in the error factor may be used for incremental modifications to the hedge strategy (e.g., adding death benefits to a program that previously covered only living benefits, or moving from swaps to Treasury Department futures).

**E. Additional Considerations for CTE70 (best efforts)**

If the company is following a CDHS, the fair value of the portfolio of contracts falling within the scope of these requirements shall be computed and compared to the CTE70 (best efforts) and CTE70 (adjusted). If the CTE70 (best efforts) is below both the fair value and CTE70 (adjusted), the company should be prepared to explain why that result is reasonable.

For the purposes of this analysis, the stochastic reserve and fair value calculations shall be done without requiring the scenario reserve for any given scenario to be equal to or in excess of the cash surrender value in aggregate for the group of contracts modeled in the projection.

**D. Specific Considerations and Requirements**

1. As part of the process of choosing a methodology and assumptions for estimating the future effectiveness of the current hedging strategy (including currently held hedge positions) for purposes of reducing the stochastic reserve, the company should review actual historical hedging effectiveness. The company shall evaluate the appropriateness of the assumptions on future trading, transaction costs, other elements of the model, the strategy, the mix of business and other items that are likely to result in materially adverse results. This includes an analysis of model assumptions that, when combined with the reliance on the hedging strategy, are likely to result in adverse results relative to those modeled. The parameters and assumptions shall be adjusted (based on testing contingent on the strategy used and other assumptions) to levels that fully reflect the risk based on historical ranges and foreseeable future ranges of the assumptions and parameters. If this is not possible by parameter adjustment, the model shall be modified to reflect them at either anticipated experience or adverse estimates of the parameters.

2. A discontinuous hedging strategy is a hedging strategy where the relationships between the sensitivities to equity markets and interest rates (commonly referred to as the Greeks) associated with the guaranteed contract holder options embedded in the variable fixed indexed annuities and other in-scope products and these same sensitivities associated with the hedging assets are subject to material discontinuities. This includes, but is not limited
to, a hedging strategy where material hedging assets will be obtained when the variable fixed indexed annuity account balances reach a predetermined level in relationship to the guarantees. Any hedging strategy, including a delta hedging strategy, can be a discontinuous hedging strategy if implementation of the strategy permits material discontinuities between the sensitivities to equity markets and interest rates associated with the guaranteed contract holder options embedded in the variable fixed indexed annuities and other in-scope products and these same sensitivities associated with the hedging assets. There may be scenarios that are particularly costly to discontinuous hedging strategies, especially where those result in large discontinuous changes in sensitivities (Greeks) associated with the hedging assets. Where discontinuous hedging strategies contribute materially to a reduction in the stochastic reserve, the company must evaluate the interaction of future trigger definitions and the discontinuous hedging strategy, in addition to the items mentioned in the previous paragraph. This includes an analysis of model assumptions that, when combined with the reliance on the discontinuous hedging strategy, may result in adverse results relative to those modeled.

3. A strategy that has a strong dependence on acquiring hedging assets at specific times that depend on specific values of an index or other market indicators may not be implemented as precisely as planned.

4. The combination of elements of the stochastic cash-flow model—including the initial actual market asset prices, prices for trading at future dates, transaction costs and other assumptions—should be analyzed by the company as to whether the stochastic cash-flow model permits hedging strategies that make money in some scenarios without losing a reasonable amount in some other scenarios. This includes, but is not limited to:

   a. Hedging strategies with no initial investment that never lose money in any scenario and in some scenarios make money.

   b. Hedging strategies that, with a given amount of initial money, never make less than accumulation at the one-period risk-free rates in any scenario but make more than this in one or more scenarios.

5. If the stochastic cash-flow model allows for such situations, the company should be satisfied that the results do not materially rely directly or indirectly on the use of such strategies. If the results do materially rely directly or indirectly on the use of such strategies, the strategies may not be used to reduce the stochastic reserve otherwise calculated.

6. In addition to the above, the method used to determine prices of financial instruments for trading in scenarios should be compared to actual initial market prices. In addition to comparisons to initial market prices, there should be testing of the pricing models that are used to determine subsequent prices when scenarios involve trading financial instruments. This testing should consider historical relationships. For example, if a method is used where recent volatility in the scenario is one of the determinants of prices for trading in that scenario, then that model should approximate actual historic prices in similar circumstances in history.
Section 10: Guidance and Requirements for Setting Contract Holder Behavior Prudent Estimate Assumptions

Drafting Note: All revisions shown in this section are in comparison to Section 10 in VM-21.

A. General

Contract holder behavior assumptions encompass actions such as lapses, withdrawals, transfers, recurring deposits, benefit utilization, option election, etc. Contract holder behavior is difficult to predict accurately, and variance in behavior assumptions can significantly affect the results. In the absence of relevant and fully credible empirical data, the company should set behavior assumptions as guided by Principle 3 in Section 1.B.

In setting behavior assumptions, the company should examine, but not be limited by, the following considerations:

1. Behavior can vary by product, market, distribution channel, fund-index performance, interest credited (current and guaranteed rates), time/product duration, etc.
2. Options embedded in the product may affect behavior.
3. Utilization of options may be elective or non-elective in nature. Living benefits often are elective, and death benefit options are generally non-elective.
4. Elective contract holder options may be more driven by economic conditions than non-elective options.
5. As the value of a product option increases, there is an increased likelihood that contract holders will behave in a manner that maximizes their financial interest (e.g., lower lapses, higher benefit utilization, etc.).
6. Behavior formulas may have both rational and irrational components (irrational behavior is defined as situations where some contract holders may not always act in their best financial interest). The rational component should be dynamic, but the concept of rationality need not be interpreted in strict financial terms and might change over time in response to observed trends in contract holder behavior based on increased or decreased financial efficiency in exercising their contractual options.
7. Options that are ancillary to the primary product features may not be significant drivers of behavior. Whether an option is ancillary to the primary product features depends on many things, such as:
   a. For what purpose was the product purchased?
   b. Is the option elective or non-elective?
   c. Is the value of the option well-known?
8. External influences may affect behavior.

B. Aggregate vs. Individual Margins

1. Prudent estimate assumptions are developed by applying a margin for uncertainty to the anticipated experience assumption. The issue of whether the level of the margin applied to
the anticipated experience assumption is determined in aggregate or independently for each
and every behavior assumption is discussed in Principle 3 in Section 1.B.

2. Although this principle discusses the concept of determining the level of margins in
aggregate, it notes that the application of this concept shall be guided by evolving practice
and expanding knowledge. From a practical standpoint, it may not always be possible to
completely apply this concept to determine the level of margins in aggregate for all
behavior assumptions.

3. Therefore, the company shall determine prudent estimate assumptions independently for
each behavior (e.g., mortality, lapses and benefit utilization), using the requirements and
guidance in this section and throughout these requirements, unless the company can
demonstrate that an appropriate method was used to determine the level of margin in
aggregate for two or more behaviors.

C. Sensitivity Testing

The impact of behavior can vary by product, time period, etc. For any assumption that is not
prescribed or stochastically modeled, the qualified actuary to whom responsibility for this group of
contracts is assigned shall use sensitivity testing to ensure that the assumption is set at the
conservative end of the plausible range. The company shall sensitivity test:

- Surrenders.
- Partial withdrawals.
- Benefit utilization.
- Other behavior assumptions if relevant to the risks in the product.

Sensitivity testing of assumptions is required and shall be more complex than, for example, base
lapse assumption plus or minus 4X% across all contracts. A more appropriate sensitivity test in this
example might be to devise parameters in a dynamic lapse formula to reflect more out-of-the-
money contracts lapsing and/or more holders of in-the-money contracts persisting and eventually
using the guarantee. The company should apply more caution in setting assumptions for behaviors
where testing suggests that stochastic modeling results are sensitive to small changes in such
assumptions. For such sensitive behaviors, the company shall use higher margins when the
underlying experience is less than fully relevant and credible.

The company shall examine the results of sensitivity testing to understand the materiality of
prudent estimate assumptions on the modeled reserve. The company shall update the sensitivity
tests periodically as appropriate, considering the materiality of the results of the tests. The
company may update the tests less frequently when the tests show less sensitivity of the modeled
reserve to changes in the assumptions being tested or the experience is not changing rapidly.
Providing there is no material impact on the results of the sensitivity testing, the company may
perform sensitivity testing:

1. Using samples of the contracts in force rather than performing the entire valuation for
each alternative assumption set.

4-2. Using data from prior periods.
D. Specific Considerations and Requirements

1. Within materiality considerations, the company should consider all relevant forms of contract holder behavior and persistency, including, but not limited to, the following:
   a. Mortality (additional guidance and requirements regarding mortality is contained in Section 11).
   b. Surrenders.
   c. Partial withdrawals (systematic and elective).
   d. Fund Account transfers (switching/exchanges).
   e. Resets/ratchets of the guaranteed amounts (automatic and elective).
   f. Future deposits.
   g. Income start date
   h. Commutation of benefit (from periodic payment to lump sum)

2. It may be acceptable to ignore certain items that might otherwise be explicitly modeled in an ideal world, particularly if the inclusion of such items reduces the calculated provisions. For example:
   a. The impact of fund account transfers (intra-contract fund index “switching”) might be ignored, unless required under the terms of the contract (e.g., automatic asset re-allocation/rebalancing, dollar cost averaging accounts, etc.) or if the contract provisions incentivize the contract holders to transfer between accounts.
   b. Future deposits might be excluded from the model, unless required by the terms of the contracts under consideration and then only in such cases where future premiums can reasonably be anticipated (e.g., with respect to timing and amount).
   c. For some non-elective benefits (nursing home benefits for example), a zero incidence rate after the surrender charge has ended, or the cash value has depleted, may be acceptable since use of a non-zero rate could reduce the modeled reserve.

Guidance Note: For some non-elective benefits (nursing home benefits for example), unless relevant company experience exists to the contrary, the use of incidence rates greater than zero after the surrender charge has ended, or the cash value has depleted might be inappropriate may not be prudent since it would reduce the modeled reserve.

3. However, the company should exercise caution in assuming that current behavior will be indefinitely maintained. For example, it might be appropriate to test the impact of a shifting asset mix and/or consider future deposits to the extent they can reasonably be anticipated and increase the calculated amounts.
4. Normally, the underlying model assumptions would differ according to the attributes of the contract being valued. This would typically mean that contract holder behavior and persistency may be expected to vary according to such characteristics as (this is not an exhaustive list):

   a. Gender.
   b. Attained age.
   c. Issue age.
   d. Contract duration.
   e. Time to maturity.
   f. Tax status.
   g. Fund Account value.
   h. Interest credited (current and guaranteed).
   i. Investment option. Available indices.
   j. Guaranteed benefit amounts.
   k. Surrender charges, transaction transfer fees or other contract charges.
   l. Distribution channel.

5. Unless there is clear evidence to the contrary, behavior assumptions should be no less conservative than past experience. Margins for contract holder behavior assumptions shall assume, without relevant and credible experience or clear evidence to the contrary, that contract holders’ efficiency will increase over time.

6. In determining contract holder behavior assumptions, the company shall use actual experience data directly applicable to the business segment (i.e., direct data) if it is available. In the absence of direct data, the company should then look to use data from a segment that is similar to the business segment (i.e., other than direct experience), whether or not the segment is directly written by the company. If data from a similar business segment are used, the assumption shall be adjusted to reflect differences between the two segments. Margins shall reflect the data uncertainty associated with using data from a similar but not identical business segment.

7. Where relevant and fully credible empirical data do not exist for a given contract holder behavior assumption, the company shall set the contract holder behavior assumption to reflect the increased uncertainty such that the contract holder behavior assumption is shifted towards the conservative end of the plausible range of expected experience that serves to increase the stochastic reserve. If there are no relevant data, the company shall set the contract holder behavior assumption to reflect the increased uncertainty such that the contract holder behavior assumption is at the conservative end of the range. Such adjustments shall be consistent with the definition of prudent estimate, with the principles described in Section 1.B, and with the guidance and requirements in this section.

8. Ideally, contract holder behavior would be modeled dynamically according to the simulated economic environment and/or other conditions. It is important to note, however, that contract holder behavior should neither assume that all contract holders act with 100%
E. Dynamic Assumptions

1. Consistent with the concept of prudent estimate assumptions described earlier, the liability model should incorporate margins for uncertainty for all risk factors that are not dynamic (i.e., the non-scenario tested assumptions) and are assumed not to vary according to the financial interest of the contract holder.

2. The company should exercise care in using static assumptions when it would be more natural and reasonable to use a dynamic model or other scenario-dependent formulation for behavior. With due regard to considerations of materiality and practicality, the use of dynamic models is encouraged, but not mandatory. Risk factors that are not scenario tested but could reasonably be expected to vary according to a stochastic process, or future states of the world (especially in response to economic drivers) may require higher margins and/or signal a need for higher margins for certain other assumptions.

3. Risk factors that are modeled dynamically should encompass the plausible range of behavior consistent with the economic scenarios and other variables in the model, including the non-scenario tested assumptions. The company shall test the sensitivity of results to understand the materiality of making alternate assumptions and follow the guidance discussed above on setting assumptions for sensitive behaviors.

F. Consistency with the CTE Level

1. All behaviors (i.e., dynamic, formulaic and non-scenario tested) should be consistent with the scenarios used in the CTE calculations (generally, the top 30% of the loss distribution). To maintain such consistency, it is not necessary to iterate (i.e., successive runs of the model) in order to determine exactly which scenario results are included in the CTE measure. Rather, in light of the products being valued, the company should be mindful of the general characteristics of those scenarios likely to represent the tail of the loss distribution and consequently use prudent estimate assumptions for behavior that are reasonable and appropriate in such scenarios. For variable–fixed annuities, these “valuation” scenarios would typically display one or more of the following attributes:

   a. Declining and/or volatile separate account asset index values, where applicable.
   b. Market index volatility, price gaps and/or liquidity constraints.
   c. Rapidly changing interest rates or persistently low interest rates.
   d. Volatile credit spreads.

2. The behavior assumptions should be logical and consistent both individually and in aggregate, especially in the scenarios that govern the results. In other words, the company should not set behavior assumptions in isolation, but give due consideration to other elements of the model. The interdependence of assumptions (particularly those governing customer behaviors) makes this task difficult and by definition requires professional judgment, but it is important that the model risk factors and assumptions:

   a. Remain logically and internally consistent across the scenarios tested.
b. Represent plausible outcomes.

c. Lead to appropriate, but not excessive, asset requirements.

4. The company should remember that the continuum of “plausibility” should not be confined or constrained to the outcomes and events exhibited by historic experience.

5. Companies should attempt to track experience for all assumptions that materially affect their risk profiles by collecting and maintaining the data required to conduct credible and meaningful studies of contract holder behavior.

G. Additional Considerations and Requirements for Assumptions Applicable to Guaranteed Living Benefits

Experience for contracts without guaranteed living benefits may be of limited use in setting a lapse assumption for contracts with in-the-money or at-the-money guaranteed living benefits. Such experience may only be used if it is appropriate (e.g., lapse experience on contracts without a living benefit may have relevance to the early durations of contracts with living benefits) and relevant to the business.

H. Policy Loans

If policy loans are applicable for the block of business, the company shall determine cash flows for each projection interval for policy loan assets by modeling existing loan balances either explicitly or by substituting assets that are a proxy for policy loans (e.g., bonds, cash, etc.) subject to the following:

1. If the company substitutes assets that are a proxy for policy loans, the company must demonstrate that such substitution:
   a. Produces reserves that are no less than those that would be produced by modeling existing loan balances explicitly.
   b. Complies with the contract holder behavior requirements stated in Section 10 above in this section.

2. If the company models policy loans explicitly, the company shall:
   a. Treat policy loan activity as an aspect of contract holder behavior and subject to the requirements above in this section.
   b. Assign loan balances either to exactly match each policy’s utilization or to reflect average utilization over a model segment or sub-segments.
   c. Model policy loan interest in a manner consistent with policy provisions and with the scenario. Include interest paid in cash as a positive policy loan cash flow in that projection interval, but do not include interest added to the loan balance as a policy loan cash flow. (The increased balance will require increased repayment cash flows in future projection intervals.)
   d. Model policy loan principal repayments, including those that occur automatically upon death or surrender. Include policy loan principal repayments as a positive policy loan cash flow, per Section 4.A.1.h.
e. Model additional policy loan principal. Include additional policy loan principal as a negative policy loan cash flow per Section 4.A.1.h (but do not include interest added to the loan balance as a negative policy loan cash flow).

f. Model any investment expenses allocated to policy loans and include them either with policy loan cash flows or insurance expense cash flows.

I. Non-Guaranteed Elements

Consistent with the definition in VM-01, Non-Guaranteed Elements (NGEs) are elements within a contract that affect policy costs or values and not guaranteed or not determined at issue. NGEs consist of elements affecting contract holder costs or values that are both established and subject to change at the discretion of the insurer.

Examples of NGEs specific to fixed annuities include but are not limited to the following: fixed credited rates, index parameters (caps, spreads, participation rates, etc.), rider fees, rider benefit features being subject to change (rollup rates, rollup period, etc.), account value charges, and dividends under participating policies or contracts.

1. Except as noted below in Section 10.J.5, the company shall include NGE in the models to project future cash flows beyond the time the company has authorized their payment or crediting.

2. The projected NGE shall reflect factors that include, but are not limited to, the following (not all of these factors will necessarily be present in all situations):
   a. The nature of contractual guarantees.
   b. The company’s past NGE practices and established NGE policies.
   c. The timing of any change in NGE relative to the date of recognition of a change in experience.
   d. The benefits and risks to the company of continuing to authorize NGE.

3. Projected NGE shall be established based on projected experience consistent with how actual NGE are determined.

4. Projected levels of NGE in the cash-flow model must be consistent with the experience assumptions used in each scenario. Contract holder behavior assumptions in the model must be consistent with the NGE assumed in the model.

5. The company may exclude any portion of an NGE that:
   a. Is not based on some aspect of the policy’s or contract’s experience.
   b. Is authorized by the board of directors and documented in the board minutes, where the documentation includes the amount of the NGE that arises from other sources. However, if the board has guaranteed a portion of the NGE into the future, the company must model that amount. In other words, the company cannot exclude from its model any NGE that the board has guaranteed for future years, even if it could have otherwise excluded them, based on this subsection.
6. The liability for contract holder dividends declared but not yet paid that has been established according to statutory accounting principles as of the valuation date is reported separately from the statutory reserve. The contract holder dividends that give rise to this dividend liability as of the valuation date may or may not be included in the cash-flow model at the company’s option.

   a. If the contract holder dividends that give rise to the dividend liability are not included in the cash-flow model, then no adjustment is needed to the resulting aggregate stochastic reserve.

   b. If the contract holder dividends that give rise to the dividend liability are included in the cash-flow model, then the resulting aggregate stochastic reserve should be reduced by the amount of the dividend liability.

7. All projected cash flows associated with NGEs shall reflect margins for adverse deviations and estimation error in prudent estimate assumptions.
Section 11: Guidance and Requirements for Setting Prudent Estimate Mortality Assumptions

Drafting Note: All revisions shown in this section are in comparison to Section 11 in VM-21.

A. Overview

1. Intent

The guidance and requirements in this section apply to setting prudent estimate mortality assumptions when determining either the stochastic reserve or the reserve for any contracts determined using the Alternative Methodology. The intent is for prudent estimate mortality assumptions to be based on facts, circumstances and appropriate actuarial practice, with only a limited role for unsupported actuarial judgment. (Where more than one approach to appropriate actuarial practice exists, the company should select the practice that the company deems most appropriate under the circumstances.)

2. Description

Prudent estimate mortality assumptions shall be determined by first developing expected mortality curves based on either available experience or published tables. Where necessary, margins shall be applied to the experience to reflect data uncertainty. The expected mortality curves shall then be adjusted based on the credibility of the experience used to determine the expected mortality curve. Section 11.B addresses guidance and requirements for determining expected mortality curves, and Section 11.C addresses guidance and requirements for adjusting the expected mortality curves to determine prudent estimate mortality.

Finally, the credibility-adjusted tables shall be adjusted for mortality improvement (where such adjustment is permitted or required) using the guidance and requirements in Section 11.D.

3. Business Segments

For purposes of setting prudent estimate mortality assumptions, the products falling under the scope of these requirements shall be grouped into business segments with different mortality assumptions. The grouping, at a minimum, should differentiate the payout annuities or deferred annuity contracts that contain VAGLBs, and where the no-VAGLB segments would include both deferred annuity contracts with no guaranteed benefits or contract with only GMDBs. Where appropriate, the grouping should also differentiate between segments which are known or expected to contain contract holders with sociodemographic, geographic, or health factors reasonably expected to impact the mortality assumptions for the segment (e.g., annuitants drawn from different countries, geographic areas, industry groups, or impaired lives on individually underwritten contracts such as structured settlements). The grouping should also generally follow the pricing, marketing, management and/or reinsurance programs of the company.

Guidance Note: This paragraph contemplates situations where it may be appropriate to differentiate mortality assumptions by segment or even by contract due to varying sociodemographic, geographic, or health factors. Particularly, though not exclusively, in the context of group payout annuity contracts, companies may have credible, contract-specific mortality experience data or relevant pooled data from annuitants drawn from...
similar industries or geographies that may be used to sub-divide inforce blocks into business segments for purposes of setting prudent estimate mortality assumptions.

For example, a company may sell group PRT contracts both to union plans in the U.S. and to private single-employer plans in another country. While both are “PRT contracts,” it would be appropriate to differentiate them for mortality assumption purposes, similar to how payout annuities vs. deferred annuities are distinguished.

Guidance Note: Distinct mortality or liability assumptions among different contracts within a group of contracts does not in itself preclude the group of contracts from being aggregated for the purposes of the broader stochastic reserve calculation.

4. Margin for Data Uncertainty

The expected mortality curves that are determined in Section 11.B may need to include a margin for data uncertainty. The margin could be in the form of an increase or a decrease in mortality, depending on the business segment under consideration. The margin shall be applied in a direction (i.e., increase or decrease in mortality) that results in a higher reserve. A sensitivity test may be needed to determine the appropriate direction of the provision for uncertainty to mortality. The test could be a prior year mortality sensitivity analysis of the business segment or an examination of current representative cells of the segment.

For purposes of this section, if mortality must be increased (decreased) to provide for uncertainty, the business segment is referred to as a plus (minus) segment.

It may be necessary, because of a change in the mortality risk profile of the segment, to reclassify a business segment from a plus (minus) segment to a minus (plus) segment to the extent compliance with this section requires such a reclassification. For example, a segment could require reclassification depending on whether it is gross or net of reinsurance.

B. Determination of Expected Mortality Curves

1. Experience Data

In determining expected mortality curves, the company shall use actual experience data directly applicable to the business segment (i.e., direct data) if it is available. In the absence of direct data, the company should then look to use data from a segment that is similar to the business segment (i.e., other than direct experience). See Section 11.B.2. for additional considerations. Finally, if there is no data, the company shall use the applicable table, as required in Section 11.B.3.

2. Data Other Than Direct Experience

Adjustments shall be applied to the data to reflect differences between the business segments, and margins shall be applied to the adjusted expected mortality curves to reflect the data uncertainty associated with using data from a similar but not identical business segment.

To the extent the mortality of a business segment is reinsured, any mortality charges that are consistent with the company’s own pricing and applicable to a substantial portion of the mortality risk also may be a reasonable starting point for the determination of the company’s expected mortality curves.
3. No Data Requirements

   i. When little or no experience or information is available on a business segment, the company shall use expected mortality curves that would produce expected deaths no less than:

      a. \([2021\ \text{SOA Deferred Annuity Mortality Table} \text{ with } \text{Projection Scale G2}]\) for individual deferred annuities that do not contain guaranteed living benefits

      \[q_x^{20XX+n} = q_x^{20XX} (1 - G2_x)^n\]

   ii. When little or no experience or information is available on a business segment, the company shall use expected mortality curves that would produce expected deaths no greater than:

      a. \([\text{The appropriate percentage } (F_x) \text{ from Table 11.1 applied to the 2012 IAM Basic Mortality Table} \text{ with } \text{Projection Scale G2}]\) for individual payout annuity contracts and deferred annuity contracts with guaranteed living benefits

      \[q_x^{2012+n} = q_x^{2017} (1 - G2_x)^n * F_x\]

      b. \([1983 \text{ Table “a”}]\) for structured settlements or other contracts with impaired mortality

      c. \([1994\ \text{GAR Table}]\) with \([\text{Projection Scale AA}]\) for group annuities

\[q_x^{1994+n} = q_x^{1994} (1 - AA_x)^n\]

The appropriate percentage \((F_x)\) from Table 1 of the 2012 IAM Basic Table with Projection Scale G2 for contracts with no VAGLBs and expected deaths no greater than the appropriate percentage \((F_x)\) from Table 1 of the 2012 IAM Basic Mortality Table with Projection Scale G2 for contracts with VAGLBs. If mortality experience on the business segment is expected to be atypical (e.g., demographics of target markets are known to have higher [lower] mortality than typical), these “no data” mortality requirements may not be adequate.

### iii. For a business segment with non-U.S. insureds, an established industry or national mortality table may be used, with approval from the domiciliary commissioner.

#### 4. Additional Considerations Involving Data

The following considerations shall apply to mortality data specific to the business segment for which assumptions are being determined (i.e., direct data discussed in Section 11.B.1 or other than direct data discussed in Section 11.B.2).

**a. Underreporting of Deaths**

Mortality data shall be examined for possible underreporting of deaths. Adjustments shall be made to the data if there is any evidence of underreporting. Alternatively, exposure by lives or amounts on contracts for which death benefits were in the money may be used to determine expected mortality curves. Underreporting on such exposures should be minimal; however, this reduced subset of data will have less credibility.

</table>
b. Experience by Contract Duration

Experience of a plus segment shall be examined to determine if mortality by contract duration increases materially due to selection at issue. In the absence of information, the company shall assume that expected mortality will increase by contract duration for an appropriate select period. As an alternative, if the company determines that mortality is affected by selection, the company could apply margins to the expected mortality in such a way that the actual mortality modeled does not depend on contract duration.

c. Modification and Relevance of Data

Even for a large company, the quantity of life exposures and deaths are such that a significant amount of smoothing may be required to determine expected mortality curves from mortality experience. Expected mortality curves, when applied to the recent historic exposures (e.g., three to seven years), should not result in an estimate of aggregate number of deaths less (greater) than the actual number deaths during the exposure period for plus (minus) segments.

In determining expected mortality curves (and the credibility of the underlying data), older data may no longer be relevant. The “age” of the experience data used to determine expected mortality curves should be documented.

d. Other Considerations

In determining expected mortality curves, consideration should be given to factors that include, but are not limited to, trends in mortality experience, trends in exposure, volatility in year-to-year A/E mortality ratios, mortality by lives relative to mortality by amounts, changes in the mix of business and product features that could lead to mortality selection.

C. Adjustment for Credibility to Determine Prudent Estimate Mortality

1. Adjustment for Credibility

The expected mortality curves determined in Section 11.B shall be adjusted based on the credibility of the experience used to determine the curves in order to arrive at prudent estimate mortality. The adjustment for credibility shall result in blending the expected mortality curves with the mortality assumption described in Section 11.B.3.a mortality table consistent with a statutory valuation mortality table. For contracts with no VAGLBs, the table shall be consistent with the appropriate percentage (F_x) from Table 1 of the 2012 IAM Basic Table with Projection Scale G2; and for contracts with VAGLBs, the table shall be consistent with the appropriate percentage (F_x) from Table 1 of the 2012 IAM Basic Mortality Table with Projection Scale G2. The approach used to adjust the curves shall suitably account for credibility.

Guidance Note: For example, when credibility is zero, an appropriate approach should result in a mortality assumption consistent with 100% of the statutory valuation mortality table used in the blending.

2. Adjustment of Statutory Valuation Mortality for Improvement
For purposes of the adjustment for credibility, the statutory valuation mortality table for a plus segment may be and the statutory valuation mortality table for a minus segment must be adjusted for mortality improvement. Such adjustment shall reflect the mortality improvement scale described in Section 11.B.3 Projection Scale G2 from the effective date of the respective statutory valuation mortality table to the experience weighted average date underlying the data used to develop the expected mortality curves (discussed in Section 11.B).

3. Credibility Procedure

The credibility procedure used shall:

a. Produce results that are reasonable.
b. Not tend to bias the results in any material way.
c. Be practical to implement.
d. Give consideration to the need to balance responsiveness and stability.
e. Take into account not only the level of aggregate claims but the shape of the mortality curve.
f. Contain criteria for full credibility and partial credibility that have a sound statistical basis and be appropriately applied.

4. Further Adjustment of the Credibility-Adjusted Table for Mortality Improvement

The credibility-adjusted table used for plus segments may be and the credibility adjusted table used for minus segments must be adjusted for mortality improvement using the applicable mortality improvement scale described in Section 11.B.3 from the experience weighted average date underlying the company experience used in the credibility process to the valuation date.

Any adjustment for mortality improvement beyond the valuation date is discussed in Section 11.D.

D. Future Mortality Improvement

The mortality assumption resulting from the requirements of Section 11.C shall be adjusted for mortality improvements beyond the valuation date if such an adjustment would serve to increase the resulting stochastic reserve. If such an adjustment would reduce the stochastic reserve, such assumptions are permitted, but not required. In either case, the assumption must be based on current relevant data with a margin for uncertainty (increasing assumed rates of improvement if that results in a higher reserve or reducing them otherwise).
Section 12: Allocation of Aggregate Reserves to the Contract Level

Drafting Note: All revisions shown in this section are in comparison to Section 11 in VM-21.

Section 23.F states that the aggregate reserve shall be allocated to the contracts falling within the scope of these requirements. That allocation should be done for both the pre- and post-reinsurance ceded reserves. Contracts that have passed the stochastic exclusion test as defined in Section 7.B will not be included in the allocation of the aggregate reserve. For the purpose of this section, if a contract does not have a cash surrender value, then the cash surrender value is assumed to be zero.

Contracts for which the Deterministic Certification Option is elected in Section 7.E are intended to use the methodology described in this section to allocate aggregate reserves in excess of the cash surrender value to individual contracts.

The contract-level reserve for each contract shall be the sum of the following:

A. The contract’s cash surrender value.

Drafting Note: The American Academy of Actuaries Annuity Reserves and Capital Work Group is including two potential options for allocating the excess portion of the aggregate reserve over cash surrender value: (1) Use the same approach as VM-21 (2) Allocate based on an actuarial present value calculation.

The Work Group did not reach a consensus between these two approaches, so wording for both is included in the text below. The Work Group recommends field testing both approaches and considering the results in determining future decisions.

**Option 1: VM-21 Approach**

B. An allocated portion of the excess of the aggregate reserve over the aggregate cash surrender value shall be allocated to each contract based on a measure of the risk of that product relative to its cash surrender value in the context of the company’s in force contracts (assuming zero cash value for contracts that do not contain such). The measure of risk should consider the impact of risk mitigation programs, including hedge programs and reinsurance, that would affect the risk of the product. The specific method of assessing that risk and how it contributes to the company’s aggregate reserve shall be defined by the company. The method should provide for an equitable allocation based on risk analysis. For contracts valued under the alternative methodology, the alternative methodology calculations provide a contract level calculation that may be a reasonable basis for allocation.

1. As an example, consider a company with the results of the following three contracts:

Table 12.1: Sample Allocation of Aggregate Reserve

<table>
<thead>
<tr>
<th>Contract (i)</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>Total</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cash Surrender Value, C</td>
<td>28</td>
<td>40</td>
<td>52</td>
<td>120</td>
</tr>
<tr>
<td>Risk adjusted measure, R</td>
<td>38</td>
<td>52</td>
<td>50</td>
<td></td>
</tr>
<tr>
<td>Aggregate Reserve</td>
<td></td>
<td></td>
<td></td>
<td>140</td>
</tr>
</tbody>
</table>
2. In this example, the Aggregate Reserve exceeds the aggregate Cash Surrender Value by 20. The 20 is allocated proportionally across the three contracts based on the allocation basis of the larger of (i) zero; and (ii) a risk adjusted measure based on reserve principles. Therefore, contracts 1 and 2 receive 45% (9/22) and 55% (11/22), respectively, of the excess Aggregate Reserve. As Contract 3 presents no risk in excess of its cash surrender value, it does not receive an allocation of the excess Aggregate Reserve.

**Option 2: Actuarial Present Value Approach**

B. An allocated portion of the excess of the aggregate reserve over the aggregate cash surrender value is allocated to policies based on a calculation of the actuarial present value of projected liability cash flows in excess of the cash surrender value:

1. Discount the liability cash flows at the NAER, pursuant to requirements in Section 4, for the scenario that produces the scenario reserve closest to, but not less than the stochastic reserve defined in Section 3.D.
   
   a. Groups of contracts that elect the Deterministic Certification Option defined in Section 7.E shall use the NAER in the single scenario used to calculate the reserve to discount liability cash flows.

2. If the actuarial present value is less than the cash surrender value, then the excess actuarial present value to be used for allocating the excess aggregate reserve over the cash value shall be floored at zero.
   
   a. If all contracts have an excess actuarial present value that is floored at zero, then use the cash surrender value to allocate any excess aggregate reserve over the aggregate cash surrender value.

3. For projecting future liability cash flows, assume the same liability assumptions that were used to calculate the stochastic reserve defined in 3.D.

4. As a hypothetical example, consider a company with the results of the following five contracts:

<table>
<thead>
<tr>
<th>Allocation Basis for the excess of the Aggregate Reserve over the Cash Surrender Value</th>
<th>10</th>
<th>12</th>
<th>0</th>
<th>22</th>

*Cash Surrender Value  
**Guaranteed Lifetime Withdrawal Benefit

**Guidance Note:** The actuarial present value (APV) in the section above is separate from the Guarantee Actuarial Present Value (GAPV) referred to in the additional standard projection amount calculation in VM-21. The GAPV is only applicable to guaranteed minimum benefits and uses prescribed liability assumptions. In contrast, the APV in this section applies to the entire contract, irrespective of whether guaranteed benefits are attached, and uses company prudent estimate liability assumptions.

3. shall be allocated to each contract based on a measure of the risk of that product relative to its cash surrender value in the context of the company’s in force contracts. The measure of risk should consider the impact of risk mitigation programs, including hedge programs and reinsurance, that would affect the risk of the product. The specific method of assessing that risk and how it contributes to the company’s aggregate reserve shall be defined by the company. The method should provide for an equitable allocation based on risk analysis. For contracts valued under the alternative methodology, the alternative methodology calculations provide a contract level calculation that may be a reasonable basis for allocation.

4. As an example, consider a company with the results of the following three contracts:

In this example, the Aggregate Reserve exceeds the aggregate Cash Surrender Value by 20. The 20 is allocated proportionally across the three contracts based on the allocation basis of the larger of (i) zero; and (ii) a risk adjusted measure based on reserve principles. Therefore, contracts 1 and 2 receive 45% (9/22) and 55% (11/22), respectively, of the excess Aggregate Reserve. As Contract 3 presents no risk in excess of its cash surrender value, it does not receive an allocation of the excess Aggregate Reserve.
Section 13: Statutory Maximum Valuation Interest Rates for Income Annuity Formulaic Reserves

Drafting Note: All revisions shown in this section are in comparison to the current VM-22 requirements.

A. Purpose and Scope

1. These requirements define for single premium immediate annuity contracts and other similar contracts, certificates and contract features the statutory maximum valuation interest rate that complies with Model #820. These are the maximum interest rate assumption requirements to be used in the CARVM and for certain contracts, the CRVM. These requirements do not preclude the use of a lower valuation interest rate assumption by the company if such assumption produces statutory reserves at least as great as those calculated using the maximum rate defined herein.

2. The following categories of contracts, certificates and contract features, whether group or individual, including both life contingent and term certain only contracts, directly written or assumed through reinsurance, with the exception of benefits arising from variable annuities, are covered in this section by VM-22:
   a. Immediate annuity contracts issued after Dec. 31, 2017;
   b. Deferred income annuity contracts issued after Dec. 31, 2017;
   c. Structured settlements in payout or deferred status issued after Dec. 31, 2017;
   d. Fixed payout annuities resulting from the exercise of settlement options or annuitizations of host contracts issued after Dec. 31, 2017;
   e. Fixed payout annuities resulting from the exercise of settlement options or annuitizations of host contracts issued during 2017, for fixed payouts commencing after Dec. 31, 2018, or, at the option of the company, for fixed payouts commencing after Dec. 31, 2017;
   f. Supplementary contracts, excluding contracts with no scheduled payments (such as retained asset accounts and settlements at interest), issued after Dec. 31, 2017;
   g. Fixed income payment streams, attributable to contingent deferred annuities (CDAs) issued after Dec. 31, 2017, once the underlying contract funds are exhausted;
   h. Fixed income payment streams attributable to guaranteed living benefits associated with deferred annuity contracts issued after Dec. 31, 2017, once the contract funds are exhausted; and
   i. Certificates with premium determination dates after Dec. 31, 2017, emanating from non-variable group annuity contracts specified in Model #820, Section 5.C.2, purchased for the purpose of providing certificate holders benefits upon their retirement.

3. Exemptions:
   a. With the permission of the domiciliary commissioner, for the categories of annuity contracts, certificates and/or contract features in scope as outlined in Section
13.A.2.d.1.B.4, Section 13.A.2.c.1.B.5, Section 13.A.2.f.1.B.6, Section 13.A.2.g.1.B.7 or Section 13.A.2.h.1.B.8, the company may use the same maximum valuation interest rate used to value the payment stream in accordance with the guidance applicable to the host contract. In order to obtain such permission, the company must demonstrate that its investment policy and practices are consistent with this approach.

4. The maximum valuation interest rates for the contracts, certificates and contract features within the scope of Section 13 of VM-22 supersede those described in Appendix VM-A and Appendix VM-C, but they do not otherwise change how those appendices are to be interpreted. In particular, Actuarial Guideline IX-B—Clarification of Methods Under Standard Valuation Law for Individual Single Premium Immediate Annuities, Any Deferred Payments Associated Therewith, Some Deferred Annuities and Structured Settlements Contracts (AG-9-B) (see VM-C) provides guidance on valuation interest rates and is, therefore, superseded by these requirements for contracts, certificates and contract features in scope. Likewise, any valuation interest rate references in Actuarial Guideline IX-C—Use of Substandard Annuity Mortality Tables in Valuing Impaired Lives Under Individual Single Premium Immediate Annuities (AG-9-C) (see VM-C) are also superseded by these requirements.

B. Definitions

1. The term “reference period” means the length of time used in assigning the Valuation Rate Bucket for the purpose of determining the statutory maximum valuation interest rate and is determined as follows:

   a. For contracts, certificates or contract features with life contingencies and substantially similar payments, the reference period is the length of time, rounded to the nearest year, from the premium determination date to the earlier of: i) the date of the last non-life-contingent payment under the contract, certificate or contract feature; and ii) the date of the first life-contingent payment under the contract, certificate or contract feature, or

   b. For contracts, certificates or contract features with no life-contingent payments and substantially similar payments, the reference period is the length of time, rounded to the nearest year, from the premium determination date to the date of the last non-life-contingent payment under the contract, certificate or contract feature, or

   c. For contracts, certificates or contract features where the payments are not substantially similar, the actuary should apply prudent judgment and select the Valuation Rate Bucket with Macaulay duration that is a best fit to the Macaulay duration of the payments in question.

   **Guidance Note:** Contracts with installment refunds or similar features should consider the length of the installment period calculated from the premium determination date as the non-life contingent period for the purpose of determining the reference period.

   **Guidance Note:** The determination in Section 13.B.1.c.2.A.3 above shall be made based on the materiality of the payments that are not substantially similar relative to the life-contingent payments.

2. The term “jumbo contract” means a contract with an initial consideration equal to or greater than $250 million. Considerations for contracts issued by an insurer to the same contract holder within 90 days shall be combined for purposes of determining whether the contracts meet this threshold.
3. The term “non-jumbo contract” means a contract that does not meet the definition of a jumbo contract.

4. The term “premium determination date” means the date as of which the valuation interest rate for the contract, certificate or contract feature being valued is determined.

5. The term “initial age” means the age of the annuitant as of his or her age last birthday relative to the premium determination date. For joint life contracts, certificates or contract features, the “initial age” means the initial age of the younger annuitant. If a contract, certificate or contract feature for an annuitant is being valued on a standard mortality table as an impaired annuitant, “initial age” means the rated age. If a contract, certificate or contract feature is being valued on a substandard mortality basis, “initial age” means an equivalent rated age.

6. The term “Table X spreads” means the prescribed VM-22 Section 13 current market benchmark spreads for the quarter prior to the premium determination date, as published on the Industry tab of the NAIC website. The process used to determine Table X spreads is the same as that specified in VM-20 Appendix 2.D for Table F, except that JP Morgan and Bank of America bond spreads are averaged over the quarter rather than the last business day of the month.

7. The term “expected default cost” means a vector of annual default costs by weighted average life. This is calculated as a weighted average of the VM-20 Table A prescribed annual default costs published on the Industry tab of the NAIC website in effect for the quarter prior to the premium determination date, using the prescribed portfolio credit quality distribution as weights.

8. The term “expected spread” means a vector of spreads by weighted average life. This is calculated as a weighted average of the Table X spreads, using the prescribed portfolio credit quality distribution as weights.

9. The term “prescribed portfolio credit quality distribution” means the following credit rating distribution:
   a. 5% Treasuries
   b. 15% Aa bonds (5% Aa1, 5% Aa2, 5% Aa3)
   c. 40% A bonds (13.33% A1, 13.33% A2, 13.33% A3)*
   d. 40% Baa bonds (13.33% Baa1, 13.33% Baa2, 13.33% Baa3)*
   *40%/3 is used unrounded in the calculations.

C. Determination of the Statutory Maximum Valuation Interest Rate

1. Valuation Rate Buckets
   a. For the purpose of determining the statutory maximum valuation interest rate, the contract, certificate or contract feature being valued must be assigned to one of four Valuation Rate Buckets labeled A through D.
b. If the contract, certificate or contract feature has no life contingencies, the Valuation Rate Bucket is assigned based on the length of the reference period (RP), as follows:

Table 3-1: Assignment to Valuation Rate Bucket by Reference Period Only

<table>
<thead>
<tr>
<th>RP ≤ 5 Years</th>
<th>5Y &lt; RP ≤ 10Y</th>
<th>10Y &lt; RP ≤ 15Y</th>
<th>RP &gt; 15Y</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>B</td>
<td>C</td>
<td>D</td>
</tr>
</tbody>
</table>

c. If the contract, certificate or contract feature has life contingencies, the Valuation Rate Bucket is assigned based on the length of the RP and the initial age of the annuitant, as follows:

Table 3-2: Assignment to Valuation Rate Bucket by Reference Period and Initial Age

<table>
<thead>
<tr>
<th>Initial Age</th>
<th>RP ≤ 5Y</th>
<th>5Y &lt; RP ≤ 10Y</th>
<th>10Y &lt; RP ≤ 15Y</th>
<th>RP &gt; 15Y</th>
</tr>
</thead>
<tbody>
<tr>
<td>90+</td>
<td>A</td>
<td>B</td>
<td>C</td>
<td>D</td>
</tr>
<tr>
<td>80–89</td>
<td>B</td>
<td>B</td>
<td>C</td>
<td>D</td>
</tr>
<tr>
<td>70–79</td>
<td>C</td>
<td>C</td>
<td>C</td>
<td>D</td>
</tr>
<tr>
<td>&lt; 70</td>
<td>D</td>
<td>D</td>
<td>D</td>
<td>D</td>
</tr>
</tbody>
</table>

2. Premium Determination Dates

a. The following table specifies the decision rules for setting the premium determination date for each of the contracts, certificates and contract features listed in Section 1:

Table 3-3: Premium Determination Dates

<table>
<thead>
<tr>
<th>Section</th>
<th>Item Description</th>
<th>Premium determination date</th>
</tr>
</thead>
<tbody>
<tr>
<td>A.2.a</td>
<td>Immediate annuity</td>
<td>Date consideration is determined and committed to by contract holder</td>
</tr>
<tr>
<td>A.2.b</td>
<td>Deferred income annuity</td>
<td>Date consideration is determined and committed to by contract holder</td>
</tr>
<tr>
<td>A.2.c</td>
<td>Structured settlements</td>
<td>Date consideration is determined and committed to by contract holder</td>
</tr>
<tr>
<td>A.2.d and A.2.e</td>
<td>Fixed payout annuities resulting from settlement options or annuitizations from host contracts</td>
<td>Date consideration for benefit is determined and committed to by contract holder</td>
</tr>
<tr>
<td>A.2.f</td>
<td>Supplementary contracts</td>
<td>Date of issue of supplementary contract</td>
</tr>
</tbody>
</table>
Guidance Note: For the purposes of the items in the table above, the phrase “date consideration is determined and committed to by the contract holder” should be interpreted by the company in a manner that is consistent with its standard practices. For some products, that interpretation may be the issue date or the date the premium is paid.

b. Immaterial Change in Consideration

If the premium determination date is based on the consideration, and if the consideration changes by an immaterial amount (defined as a change in present value of less than 10% and less than $1 million) subsequent to the original premium determination date, such as due to a data correction, then the original premium determination date shall be retained. In the case of a group annuity contract where a single premium is intended to cover multiple certificates, certificates added to the contract after the premium determination date that do not trigger the company’s right to reprice the contract shall be treated as if they were included in the contract as of the premium determination date.

3. Statutory Maximum Valuation Interest Rate

a. For a given contract, certificate or contract feature, the statutory maximum valuation interest rate is determined based on its assigned Valuation Rate Bucket (Section 13.C.1A) and its Premium Determination Date (Section 13.C.2.B) and whether the contract associated with it is a jumbo contract or a non-jumbo contract.

b. Statutory maximum valuation interest rates for jumbo contracts are determined and published daily by the NAIC on the Industry tab of the NAIC website. For a given premium determination date, the statutory maximum valuation interest rate is the daily statutory maximum valuation interest rate published for that premium determination date.

c. Statutory maximum valuation interest rates for non-jumbo contracts are determined and published quarterly by the NAIC on the Industry tab of the NAIC website by the third business day of the quarter. For a given premium determination date, the statutory maximum valuation interest rate is the quarterly statutory maximum valuation interest rate published for the quarter in which the premium determination date falls.

d. Quarterly Valuation Rate:

For each Valuation Rate Bucket, the quarterly valuation rate is defined as follows:

\[ I_q = R + S - D - E \]

Where:
a. R is the reference rate for that Valuation Rate Bucket (defined in Section 13.C.4D);

b. S is the spread rate for that Valuation Rate Bucket (defined in Section 13.C.5E);

c. D is the default cost rate for that Valuation Rate Bucket (defined in Section 13.C.6F);

and

d. E is the spread deduction defined as 0.25%.

e. Daily Valuation Rate:

For each Valuation Rate Bucket, the daily valuation rate is defined as follows:

\[ I_d = I_q + C_{d,1} - C_q \]

Where:

a. \( I_q \) is the quarterly valuation rate for the calendar quarter preceding the business day immediately preceding the premium determination date;

b. \( C_{d,1} \) is the daily corporate rate (defined in Section 13.C.7G) for the business day immediately preceding the premium determination date; and

c. \( C_q \) is the average daily corporate rate (defined in Section 13.C.8H) corresponding to the same period used to develop \( I_q \).

For jumbo contracts, the daily statutory maximum valuation interest rate is the daily valuation rate (\( I_d \)) rounded to the nearest one-hundredth of one percent (1/100 of 1%).

4. Reference Rate

Reference rates are updated quarterly as described below:

a. The “quarterly Treasury rate” is the average of the daily Treasury rates for a given maturity over the calendar quarter prior to the premium determination date. The quarterly Treasury rate is downloaded from https://fred.stlouisfed.org, and is rounded to two decimal places.

b. Download the quarterly Treasury rates for two-year, five-year, 10-year and 30-year U.S. Treasuries.

c. The reference rate for each Valuation Rate Bucket is calculated as the weighted average of the quarterly Treasury rates using Table 1 weights (defined in Section 13.C.9I) effective for the calendar year in which the premium determination date falls.

5. Spread

The spreads for each Valuation Rate Bucket are updated quarterly as described below:

a. Use the Table X spreads from the NAIC website for WALs two, five, 10 and 30 years only to calculate the expected spread.
b. Calculate the spread for each Valuation Rate Bucket, which is a weighted average of the expected spreads for WALs two, five, 10 and 30 using Table 2 weights (defined in Section 3.1) effective for the calendar year in which the premium determination date falls.

6. Default costs for each Valuation Rate Bucket are updated annually as described below:
   a. Use the VM-20 prescribed annual default cost table (Table A) in effect for the quarter prior to the premium determination date for WAL two, WAL five and WAL 10 years only to calculate the expected default cost. Table A is updated and published annually on the Industry tab of the NAIC website during the second calendar quarter and is used for premium determination dates starting in the third calendar quarter.
   b. Calculate the default cost for each Valuation Rate Bucket, which is a weighted average of the expected default costs for WAL two, WAL five and WAL 10, using Table 3 weights (defined in Section 13.C.9I) effective for the calendar year in which the premium determination date falls.

7. Daily Corporate Rate

Daily corporate rates for each valuation rate bucket are updated daily as described below:

   a. Each day, download the Bank of America Merrill Lynch U.S. corporate effective yields as of the previous business day’s close for each index series shown in the sample below from the St. Louis Federal Reserve website: https://research.stlouisfed.org/fred2/categories/32348. To access a specific series, search the St. Louis Federal Reserve website for the series name by inputting the name into the search box in the upper right corner, or input the following web address: https://research.stlouisfed.org/fred2/series/[replace with series name from the table below].

<table>
<thead>
<tr>
<th>Maturity</th>
<th>Series Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>1Y – 3Y</td>
<td>BAMLC1A0C13YEY</td>
</tr>
<tr>
<td>3Y – 5Y</td>
<td>BAMLC2A0C35YEY</td>
</tr>
<tr>
<td>5Y – 7Y</td>
<td>BAMLC3A0C57YEY</td>
</tr>
<tr>
<td>7Y – 10Y</td>
<td>BAMLC4A0C710YEY</td>
</tr>
<tr>
<td>10Y – 15Y</td>
<td>BAMLC7A0C1015YEY</td>
</tr>
<tr>
<td>15Y+</td>
<td>BAMLC8A0C15PYEY</td>
</tr>
</tbody>
</table>

b. Calculate the daily corporate rate for each valuation rate bucket, which is a weighted average of the Bank of America Merrill Lynch U.S. corporate effective yields, using Table 4 weights (defined in Section 13.C.9I) effective for the calendar year in which the business date immediately preceding the premium determination date falls.

8. Average Daily Corporate Rate

Average daily corporate rates are updated quarterly as described below:
a. Download the quarterly average Bank of America Merrill Lynch U.S. corporate effective yields for each index series shown in Section 3.G.1 from the St. Louis Federal Reserve website: https://research.stlouisfed.org/fred2/categories/32348. To access a specific series, search the St. Louis Federal Reserve website for the series name by inputting the name into the search box in the upper right corner, or input the following web address: https://research.stlouisfed.org/fred2/series/[replace with series name from Section 13.C.7.aG.1].

b. Calculate the average daily corporate rate for each valuation rate bucket, which is a weighted average of the quarterly average Bank of America Merrill Lynch U.S. corporate effective yields, using Table 4 weights (defined in Section 13.C.9I) for the same calendar year as the weight tables (i.e. Tables 1, 2, and 3) used in calculating \( I_q \) in Section 13.C.3.e5.

9. Weight Tables 1 through 4

The system for calculating the statutory maximum valuation interest rates relies on a set of four tables of weights that are based on duration and asset/liability cash-flow matching analysis for representative annuities within each valuation rate bucket. A given set of weight tables is applicable to the calculations for every day of the calendar year.

In the fourth quarter of each calendar year, the weights used within each valuation rate bucket for determining the applicable valuation interest rates for the following calendar year will be updated using the process described below. In each of the four tables of weights, the weights in a given row (valuation rate bucket) must add to exactly 100%.

Weight Table 1

The process for determining Table 1 weights is described below:

a. Each valuation rate bucket has a set of representative annuity forms. These annuity forms are as follows:

i. Bucket A:
   a) Single Life Annuity age 91 with 0 and five-year certain periods.
   b) Five-year certain only.

ii. Bucket B:
   a) Single Life Annuity age 80 and 85 with 0, five-year and 10-year certain periods.
   b) 10-year certain only.

iii. Bucket C:
   a) Single Life Annuity age 70 with 0 and 15-year certain periods.
   b) Single Life Annuity age 75 with 0, 10-year and 15-year certain periods.
   c) 15-year certain only.

iv. Bucket D:
a) Single Life Annuity age 55, 60 and 65 with 0 and 15-year certain periods.

b) 25-year certain only.

b. Annual cash flows are projected assuming annuity payments are made at the end of each year. These cash flows are averaged for each valuation rate bucket across the annuity forms for that bucket using the statutory valuation mortality table in effect for the following calendar year for individual annuities for males (ANB).

c. The average daily rates in the third quarter for the two-year, five-year, 10-year and 30-year U.S. Treasuries are downloaded from https://fred.stlouisfed.org as input to calculate the present values in Step d4.

d. The average cash flows are summed into four time period groups: years 1–3, years 4–7, years 8–15 and years 16–30. (Note: The present value of cash flows beyond year 30 are discounted to the end of year 30 and included in the years 16–30 group. This present value is based on the lower of 3% and the 30-year Treasury rate input in Step c3.)

e. The present value of each summed cash-flow group in Step d4 is then calculated by using the Step 3 U.S. Treasury rates for the midpoint of that group (and using the linearly interpolated U.S. Treasury rate when necessary).

f. The duration-weighted present value of the cash flows is determined by multiplying the present value of the cash-flow groups by the midpoint of the time period for each applicable group.

g. Weightings for each cash-flow time period group within a valuation rate bucket are calculated by dividing the duration weighted present value of the cash flow by the sum of the duration weighted present value of cash flow for each valuation rate bucket.

Weight Tables 2 through 4

Weight Tables 2 through 4 are determined using the following process:

i. Table 2 is identical to Table 1.

ii. Table 3 is based on the same set of underlying weights as Table 1, but the 10-year and 30-year columns are combined since VM-20 default rates are only published for maturities of up to 10 years.

iii. Table 4 is derived from Table 1 as follows:

a) Column 1 of Table 4 is identical to column 1 of Table 1.

b) Column 2 of Table 4 is 50% of column 2 of Table 1.

c) Column 3 of Table 4 is identical to column 2 of Table 4.

d) Column 4 of Table 4 is 50% of column 3 of Table 1.

e) Column 5 of Table 4 is identical to column 4 of Table 4.

f) Column 6 of Table 4 is identical to column 4 of Table 1.

10. Group Annuity Contracts

For a group annuity purchased under a retirement or deferred compensation plan (Section 13.A.2.iB.9), the following apply:
a. The statutory maximum valuation interest rate shall be determined separately for each certificate, considering its premium determination date, the certificate holder’s initial age, the reference period corresponding to its form of payout and whether the contract is a jumbo contract or a non-jumbo contract.

**Guidance Note:** Under some group annuity contracts, certificates may be purchased on different dates.

b. In the case of a certificate whose form of payout has not been elected by the beneficiary at its premium determination date, the statutory maximum valuation interest rate shall be based on the reference period corresponding to the normal form of payout as defined in the contract or as is evidenced by the underlying pension plan documents or census file. If the normal form of payout cannot be determined, the maximum valuation interest rate shall be based on the reference period corresponding to the annuity form available to the certificate holder that produces the most conservative rate.

**Guidance Note:** The statutory maximum valuation interest rate will not change when the form of payout is elected.
Valuation Manual Section II. Reserve Requirements

Subsection 2: Annuity Products

A. This subsection establishes reserve requirements for all contracts classified as annuity contracts as defined in SSAP No. 50 in the AP&P Manual.

B. Minimum reserve requirements for variable annuity (VA) contracts and similar business, specified in VM-21, Requirements for Principle-Based Reserves for Variable Annuities, shall be those provided by VM-21. The minimum reserve requirements of VM-21 are considered PBR requirements for purposes of the Valuation Manual.

C. Minimum reserve requirements for fixed annuity contracts issued prior to 1/1/2024 are those requirements as found in VM-A and VM-C as applicable, with the exception of the minimum requirements for the valuation interest rate for single premium immediate annuity contracts, and other similar contracts, issued after Dec. 31, 2017, including those fixed payout annuities emanating from host contracts issued on or after Jan. 1, 2017, and on or before Dec. 31, 2017. The maximum valuation interest rate requirements for those contracts and fixed payout annuities are defined in Section 13 of VM-22, Statutory Maximum Valuation Interest Rates for Income Annuity Formulaic Reserves.

C.D. Minimum reserve requirements for fixed annuity contracts issued on 1/1/2024 and later are those requirements as found in Sections 1 through 12 of VM-22.

E. The below principles may serve as key considerations for assessing whether VM-21 or VM-22 requirements apply:

1. Index-linked or modified guaranteed annuity contracts or riders that satisfy both of the following conditions may be a key consideration for application of VM-22 requirements:
   a. Guarantees the principal amount of purchase payments, net of any partial withdrawals, and interest credited thereto, less any deduction (without regard to its timing) for sales, administrative or other expenses or charges.
   b. Credits a rate of interest under the contract that is at least equal to the minimum rate required to be credited by the standard nonforfeiture law in the jurisdiction in which the contract is issued.

   Guidance Note: Paragraph E.1.b is intended to apply prior to the application of any market value adjustments for modified guaranteed annuities where the underlying assets are held in a separate account. If meeting Paragraph E.1.b prior to the application of any market value adjustments and Paragraph E.1.a above, it may be appropriate to value such contracts under VM-22 requirements.

2. Index-linked or modified guaranteed annuity contracts that do not satisfy either of the two conditions listed above in Paragraph E.1.i and E.1.ii may be a key consideration for application of VM-21 requirements.
Subsection 6: Riders and Supplemental Benefits

Drafting Note: All revisions shown in this section are in comparison to Subsection 6 in Section II of the Valuation Manual.

Guidance Note: Policies or contracts with riders and supplemental benefits which are created to simply disguise benefits, riders, or contracts subject to the Valuation Manual section describing the reserve methodology for the base product to which they are attached, VM-20 Section 3.A.1, or exploit a perceived loophole, must be reserved in a manner similar to more typical designs with similar riders.

A. If a rider or supplemental benefit is attached to a health insurance product, annuity product, deposit-type contract, or credit life or disability product, it may be valued with the base contract unless it is required to be separated by regulation or other requirements.

B. For supplemental benefits on life insurance policies or annuity contracts, including Guaranteed Insurability, Accidental Death or Disability Benefits, Convertibility, Nursing Home Benefits or Disability Waiver of Premium Benefits, the supplemental benefit may be valued with the base policy or contract and follow the reserve requirements for the base policy or contract under VM-20, VM-21, VM-22, VM-A, and/or VM-C, as applicable.

C. ULSG and other secondary guarantee riders on a life insurance policy shall be valued with the base policy and follow the reserve requirements for ULSG policies under VM-20, VM-A and/or VM-C, as applicable.

D. Any guaranteed minimum benefits on life insurance policies or annuity contracts not subject to Paragraph C above including, but not limited to, Guaranteed Minimum Accumulation Benefits, Guaranteed Minimum Death Benefits, Guaranteed Minimum Income Benefits, Guaranteed Minimum Withdrawal Benefits, Guaranteed Lifetime Income Benefits, Guaranteed Lifetime Withdrawal Benefits, Guaranteed Payout Annuity Floors, Waiver of Surrender Charges, Return of Premium, Systematic Withdrawal Benefits under Required Minimum Distributions, and all similar guaranteed benefits shall be valued with the base policy or contract and follow the reserve requirements for the base policy or contract under VM-20, VM-21, VM-22, and VM-A and/or VM-C, as applicable.

D-E. If a rider or supplemental benefit to a life insurance policy or annuity contract that is not addressed in Paragraphs B, C, or D above possesses any of the following attributes, the rider or supplemental benefit shall be valued with the base policy or contract and follow the reserve requirements for the base policy or contract under VM-20, VM-21, VM-22, and VM-A and/or VM-C, as applicable.

1. The rider or supplemental benefit does not have a separately identified premium or charge.

2. The rider or supplemental benefit premium, charge, value or benefits are determined by referencing the base policy or policy contract features or performance.

3. The base policy or policy contract value or benefits are determined by referencing the rider or supplemental benefit features or performance. The deduction of rider or benefit premium or charge from the contract value is not sufficient for a determination by reference.
**E. F.** If a term life insurance rider on the named insured[s] on the base life insurance policy does not meet the conditions of Paragraph DE above, and either (1) guarantees level or near level premiums until a specified duration followed by a material premium increase; or (2) for a rider for which level or near level premiums are expected for a period followed by a material premium increase, the rider is separated from the base policy and follows the reserve requirements for term policies under VM20, VM-A and/or VM-C, as applicable.

**F. G.** For all other riders or supplemental benefits on life insurance policies or annuity contracts not addressed in Paragraphs B through E above, the riders or supplemental benefits may be included with the base policy or contract and follow the reserve requirements for the base policy or contract under VM-20, VM-21, VM-22, VM-A and/or VM-C, as applicable. For a given rider, the election to include riders or supplemental benefits with the base policy or contract shall be determined at the policy form level, not on a policy-by-policy basis, and shall be treated consistently from year-to-year, unless otherwise approved by the domiciliary commissioner.

**G. H.** Any supplemental benefits and riders offered on life insurance policies or annuity contracts that would have a material impact on the reserve if elected later in the contract life, such as joint income benefits, nursing home benefits, or withdrawal provisions on annuity contracts, shall be considered when determining reserves using the following principles:

1. Policyholders with living benefits and annuitization in the same contract will generally use the more valuable of the two benefits.

2. When advantageous, policyholders will commence living benefit payouts if not started yet.
July 16, 2021
Bruce Sartain, Chair
Valuation Manual (VM)-22 (A) Subgroup
Life Actuarial (A) Task Force
National Association of Insurance Commissioners (NAIC)

Dear Mr. Sartain,

The American Academy of Actuaries\(^1\) Annuity Reserves and Capital Work Group (ARCWG) presented a fixed annuity principle-based reserving (PBR) framework proposal to the VM-22 Subgroup during its October 21, 2020 meeting. This document provides ARCWG’s initial draft of NAIC Valuation Manual Section II and VM-22 requirements associated with the ARCWG proposal. We ask for the VM-22 Subgroup’s consideration of the language herein as a foundation for further drafting efforts, in your efforts to advance toward an NAIC fixed annuity PBR framework.

Please let us know if you have any follow-up inquiries in response to this document. Again, we appreciate the opportunity to propose the fixed annuity framework and all of the efforts made by the VM-22 Subgroup to focus on this topic.

Sincerely,
Ben Slutsker
Chairperson, Annuity Reserves and Capital Work Group
American Academy of Actuaries

\(^1\) The American Academy of Actuaries is a 19,500-member professional association whose mission is to serve the public and the U.S. actuarial profession. For more than 50 years, the Academy has assisted public policymakers on all levels by providing leadership, objective expertise, and actuarial advice on risk and financial security issues. The Academy also sets qualification, practice, and professionalism standards for actuaries in the United States.

  A. Stochastic Exclusion Test Requirement Overview .............................................................................. 30
Section 1: Background

A. Purpose

These requirements establish the minimum reserve valuation standard for non-variable annuity contracts as defined in Section 2.A and issued on or after 1/1/2024. For all contracts encompassed by the Scope, these requirements constitute the Commissioners Annuity Reserve Valuation Method (CARVM) and, for certain contracts, the Commissioners Reserve Valuation Method (CRVM).

Guidance Note: CRVM requirements apply to some group pension contracts.

B. Principles

The projection methodology used to calculate the stochastic reserve is based on the following set of principles. These principles should be followed when interpreting and applying the methodology in these requirements and analyzing the resulting reserves.

Guidance Note: The principles should be considered in their entirety, and it is required that companies meet these principles with respect to those contracts that fall within the scope of these requirements and are in force as of the valuation date to which these requirements are applied.

Principle 1: The objective of the approach used to determine the stochastic reserve is to quantify the amount of statutory reserves needed by the company to be able to meet contractual obligations in light of the risks to which the company is exposed with an element of conservatism consistent with statutory reporting objectives.

Principle 2: The calculation of the stochastic reserve is based on the results derived from an analysis of asset and liability cash flows produced by the application of a stochastic cash-flow model to equity return and interest rate scenarios. For each scenario, the greatest present value of accumulated deficiency is calculated. The analysis reflects prudent estimate assumptions for deterministic variables and is performed in aggregate (subject to limitations related to contractual provisions) to allow the natural offset of risks within a given scenario. The methodology uses a projected total cash flow analysis by including all projected income, benefit, and expense items related to the business in the model and sets the stochastic reserve at a degree of confidence using the CTE measure applied to the set of scenario specific greatest present values of accumulated deficiencies that is deemed to be reasonably conservative over the span of economic cycles.

Principle 3: The implementation of a model involves decisions about the experience assumptions and the modeling techniques to be used in measuring the risks to which the company is exposed. Generally, assumptions are to be based on the conservative end of the confidence interval. The choice of a conservative estimate for each assumption may result in a distorted measure of the total risk. Conceptually, the choice of assumptions and the modeling decisions should be made so that the final result approximates what would be obtained for the
stochastic reserve at the required CTE level if it were possible to calculate results over the joint
distribution of all future outcomes. In applying this concept to the actual calculation of the
stochastic reserve, the company should be guided by evolving practice and expanding
knowledge base in the measurement and management of risk.

**Guidance Note:** The intent of Principle 3 is to describe the conceptual framework for setting
assumptions. Section 10 provides the requirements and guidance for setting contract holder
behavior assumptions and includes alternatives to this framework if the company is unable to
fully apply this principle.

**Principle 4:** While a stochastic cash-flow model attempts to include all real-world risks
relevant to the objective of the stochastic cash-flow model and relationships among the risks,
it will still contain limitations because it is only a model. The calculation of the stochastic
reserve is based on the results derived from the application of the stochastic cash-flow model
to scenarios, while the actual statutory reserve needs of the company arise from the risks to
which the company is (or will be) exposed in reality. Any disconnect between the model and
reality should be reflected in setting prudent estimate assumptions to the extent not addressed
by other means.

**Principle 5:** Neither a cash-flow scenario model nor a method based on factors calibrated to
the results of a cash-flow scenario model can completely quantify a company’s exposure to
risk. A model attempts to represent reality but will always remain an approximation thereto
and, hence, uncertainty in future experience is an important consideration when determining
the stochastic reserve. Therefore, the use of assumptions, methods, models, risk management
strategies (e.g., hedging), derivative instruments, structured investments or any other risk
transfer arrangements (such as reinsurance) that serve solely to reduce the calculated
stochastic reserve without also reducing risk on scenarios similar to those used in the actual
cash-flow modeling are inconsistent with these principles. The use of assumptions and risk
management strategies should be appropriate to the business and not merely constructed to
exploit “foreknowledge” of the components of the required methodology.

C. Risks Reflected

1. The risks reflected in the calculation of reserves under these requirements arise from actual
or potential events or activities that are both:
   a. Directly related to the contracts falling under the scope of these requirements or
      their supporting assets; and
   b. Capable of materially affecting the reserve.

2. Categories and examples of risks reflected in the reserve calculations include, but are not
necessarily limited to:
   a. Asset risks
      i. Credit risks (e.g., default or rating downgrades).
ii. Commercial mortgage loan roll-over rates (roll-over of bullet loans).

iii. Uncertainty in the timing or duration of asset cash flows (e.g., shortening (prepayment risk) and lengthening (extension risk)).

iv. Performance of equities, real estate, and Schedule BA assets.

v. Call risk on callable assets.

vi. Separate account fund performance.

vii. Risk associated with hedge instrument (includes basis, gap, price, parameter estimation risks, and variation in assumptions).

viii. Currency risk.

b. Liability risks

i. Reinsurer default, impairment, or rating downgrade known to have occurred before or on the valuation date.

ii. Mortality/longevity, persistency/lapse, partial withdrawal, and premium payment risks.

iii. Utilization risk associated with guaranteed living benefits.

iv. Anticipated mortality trends based on observed patterns of mortality improvement or deterioration, where permitted.

v. Annuitzation risks.

vi. Additional premium dump-ins or deposits (high interest rate guarantees in low interest rate environments).

vii. Applicable expense risks, including fluctuation maintenance expenses directly attributable to the business, future commission expenses, and expense inflation/growth.

c. Combination risks

i. Risks modeled in the company’s risk assessment processes that are related to the contracts, as described above.

ii. Disintermediation risk (including such risk related to payment of surrender or partial withdrawal benefits).

iii. Risks associated with revenue-sharing income.

3. The risks not necessarily reflected in the calculation of reserves under these requirements are:
a. Those not associated with the policies or contracts being valued, or their supporting assets.

b. Determined to not be capable of materially affecting the reserve.

4. Categories and examples of risks not reflected in the reserve calculations include, but are not necessarily limited to:

a. Asset risks
   i. Liquidity risks associated with sudden and significant levels of withdrawals and surrenders.

b. Liability risks
   i. Reinsurer default, impairment or rating downgrade occurring after the valuation date.
   ii. Catastrophic events (e.g., epidemics or terrorist events).
   iii. Major breakthroughs in life extension technology that have not yet fundamentally altered recently observed mortality experience.
   iv. Significant future reserve increases as an unfavorable scenario is realized.

c. General business risks
   i. Deterioration of reputation.
   ii. Future changes in anticipated experience (reparameterization in the case of stochastic processes), which would be triggered if and when adverse modeled outcomes were to actually occur.
   iii. Poor management performance.
   iv. The expense risks associated with fluctuating amounts of new business.
   v. Risks associated with future economic viability of the company.
   vi. Moral hazards.
   vii. Fraud and theft.

D. Specific Definitions for VM-22

**Buffer Annuity**
Interchangeable term for Registered Index-Linked Annuity (RILA). See definition for Registered Index-Linked Annuity below.

**Deferred Income Annuity (DIA)**
An annuity which guarantees a periodic payment for the life of the annuitant or a term certain and payments begin one year or later after (or from) the issue date if the contract holder survives to a predetermined future age.

**Fixed Indexed Annuity (FIA)**
An annuity with an account value where the contract holder has the option for a portion or all of the account value to grow at a rate linked to an external index, typically with guaranteed principal.

**Flexible Premium Deferred Annuity (FPDA)**
An annuity with an account value established with a premium amount but allows for additional deposits to be paid into the annuity over time, resulting in an increase to the account value. The contract also has a guaranteed interest rate during the accumulation phase and has guaranteed mortality and interest rates applicable at the time of conversion to the payout phase.

**Funding Agreement**
A contract issued to an institutional investor (domestic and international non-qualified fixed income investors) that provides fixed or floating interest rate guarantees.

**Guaranteed Investment Contract (GIC)**
Insurance contract typically issued to a retirement plan (defined contribution) under which the insurer accepts a deposit (or series of deposits) from the purchaser and guarantees to pay a specified interest rate on the funds deposited during a specified period of time.

**Index Credit Hedge Margin**
A margin capturing the risk of inefficiencies in the company’s hedging program supporting index credits. This includes basis risk, persistency risk, and the risk associated with modeling decisions and simplifications. It also includes any uncertainty of costs associated with managing the hedging program and changes due to investment and management decisions.

**Index Credit**
Any interest credit, multiplier, factor, bonus, charge reduction, or other enhancement to policy values that is linked to an index or indices. Amounts credited to the policy resulting from a floor on an index account are included.

**Index Crediting Strategy**
The strategy defined in a contract to determine index credits for a contract. This refers to underlying index, index parameters, date, timing, and other elements of the crediting method.

**Index Parameter**
Cap, floor, participation rate, spreads, or other features describing how the contract utilizes the index.

**Longevity Reinsurance**
An agreement, typically a reinsurance arrangement covering one or more group or individual annuity contracts, under which an insurance company assumes the longevity risk associated with
periodic payments made to specified annuitants under one or more immediate or deferred payout annuity contracts. A common example is participants in one or more underlying retirement plans.

Typically, the reinsurer pays a portion of the actual benefits due to the underlying annuitants (or, in some cases, a pre-agreed amount per annuitant), while the ceding insurance company retains the assets supporting the reinsured annuity payments and pays periodic, ongoing premiums to the reinsurer over the expected lifetime of benefits paid to the specified annuitants. Such agreements may contain net settlement provisions such that only one party makes ongoing cash payments in a particular period. Under these agreements, longevity risk may be transferred on either a permanent basis or for a prespecified period of time, and these agreements may or may not permit early termination.

Agreements which are not treated as reinsurance under Statement of Statutory Accounting Principles (SSAP) No. 61R are not included in this definition. In particular, contracts under which payments are made based on the aggregate mortality experience of a population of lives which are not covered by an underlying group or individual annuity contract (e.g., mortality index-based longevity swaps) are not included in this definition.

**Market Value Adjustment (MVA) Annuity**
An annuity with an account value where withdrawals and full surrenders are subject to adjustments based on interest rates or index returns at the time of withdrawal/surrender. There could be ceilings and floors on the amount of the market-value adjustment.

**Modified Guaranteed Annuity (MGA)**
A type of market-value adjusted annuity contract where the underlying assets are held in an insurance company separate account and the value of which are guaranteed if held for specified periods of time. The contract contains nonforfeiture values that are based upon a market-value adjustment formula if held for shorter periods.

**Multiple Year Guaranteed Annuity (MYGA)**
A type of fixed annuity that provides a pre-determined and contractually guaranteed interest rate for specified periods of time, after which there is typically an annual reset or renewal of a multiple year guarantee period.

**Pension Risk Transfer (PRT) Annuity**
An annuity, typically a group contract or reinsurance agreement, issued by an insurance company providing periodic payments to annuitants receiving immediate or deferred benefits from one or more retirement plans. Typically, the insurance company holds the assets supporting the benefits, which may be held in the general or separate account, and retains not only longevity risk but also asset risks (e.g., credit risk and reinvestment risk).

**Registered Index-Linked Annuity (RILA)**
An annuity with an account value where the contract holder has the option for a portion or all of the account value to grow at a rate linked to an external index, similar to a Fixed Indexed Annuity, but with downside risk exposure that may not guarantee full principal repayment. These contracts may include a cap on upside returns, and may also include a floor on downside returns which may be below zero percent.
Single Premium Immediate Annuity (SPIA)
An annuity purchased with a single premium amount which guarantees a periodic payment for the life of the annuitant or a term certain and payments begin within one year after (or from) the issue date.

Single Premium Deferred Annuity (SPDA)
An annuity with an account value established with a single premium amount that grows with a guaranteed interest rate during the accumulation phase and has guaranteed mortality and interest rates applicable at the time of conversion to the payout phase. May also include cases where the premium is accepted for a limited amount of time early in the contract life, such as only in the first duration.

Stable Value Contract
A contract that provides limited investment guarantees, typically preserving principal while crediting steady, positive returns and protecting against losses or declines in yield. Underlying asset portfolios typically consist of fixed income securities, which may sit in the insurer’s general account, a separate account, or in a third-party trust. These contracts often support defined contribution or defined benefit retirement plan liabilities.

Structured Settlement Contract (SSC)
A contract that provides periodic benefits and is purchased with a single premium amount stemming from various types of claims pertaining to court settlements or out-of-court settlements from tort actions arising from accidents, medical malpractice, and other causes. Adverse mortality is typically expected for these contracts.

Synthetic GIC
Contract that simulates the performance of a traditional GIC through a wrapper, swap, or other financial instruments, with the main difference being that the assets are owned by the policyholder or plan trust.

Term Certain Payout Annuity
A contract issued, which offers guaranteed periodic payments for a specified period of time, not contingent upon mortality or morbidity of the annuitant.

Two-Tiered Annuity
A deferred annuity with two tiers of account values. One, with a higher accumulation interest rate, is only available for annuitization or death. The other typically contains a lower accumulation interest rate, and is only available upon surrender.
Section 2: Scope and Effective Date

A. Scope

Subject to the requirements of this VM-22 are annuity contracts, certificates and contract features, whether group or individual, including both life contingent and term-certain-only, directly written or assumed through reinsurance issued on or after 1/1/2024, with the exception of contracts or benefits listed below.

Products out of scope include:

- Contracts or benefits that are subject to VM-21 (such as variable annuities, RILAs, buffer annuities, and structured annuities)
- GICs
- Synthetic GICs
- Stable Value Contracts
- Funding Agreements

Products in scope of VM-22 include fixed annuities which consist of, but are not limited to, the following list:

- **Account Value Based Annuities**
  - Deferred Annuities (SPDA & FPDA)
  - Multi-Year Guarantee Annuities (MYGA)
  - Fixed Indexed Annuities (FIA)
  - Market-Value Adjustments (MVA)
  - Two-tiered Annuities
  - Guarantees/Benefits/Riders on Fixed Annuity Contracts

- **Payout Annuities**
  - Single Premium Immediate Annuities (SPIA)
  - Deferred Income Annuities (DIA)
  - Term Certain Payout Annuity
  - Pension Risk Transfer Annuities (PRT)
  - Structured Settlement Contracts (SSC)
  - Longevity Reinsurance

The company may elect to exclude one or more groups of contracts from the stochastic reserve calculation in certain situations, pursuant to the exclusion test requirements defined in Section 3.E of VM-22.

B. Effective Date & Transition

**Effective Date**

These requirements apply for valuation dates on or after January 1, 2024.

**Transition**

A company may elect to establish minimum reserves pursuant to applicable requirements in VM-A and VM-C for business otherwise subject to VM-22 PBR requirements and issued during the
first three years following the effective date of VM-22 PBR. If a company during the three years elects to apply VM-22 PBR to a block of such business, then a company must continue to apply the requirements of VM-22 PBR for future issues of this business. Irrespective of the transition date, a company shall apply VM-22 PBR requirements to applicable blocks of business on a prospective basis starting at least three years after the effective date.
Section 3: Reserve Methodology

A. Aggregate Reserve

The aggregate reserve for contracts falling within the scope of these requirements shall equal the stochastic reserve (following the requirements of Section 4) less any applicable PIMR for all contracts not valued under applicable requirements in VM-A and VM-C, plus the reserve for any contracts valued under applicable requirements in VM-A and VM-C.

**Guidance Note:** Contracts valued under applicable requirements in VM-A and VM-C are ones that pass the exclusion test and elect to not model PBR stochastic reserves, per the requirements in Section 3.E.

B. Impact of Reinsurance Ceded

All components in the aggregate reserve shall be determined post-reinsurance ceded, that is net of any reinsurance cash flows arising from treaties that meet the statutory requirements that allow the treaty to be accounted for as reinsurance. A pre-reinsurance ceded reserve also needs to be determined by ignoring all reinsurance cash flows (costs and benefits) in the reserve calculation.

C. To Be Determined

D. The Stochastic Reserve

1. The stochastic reserve shall be determined based on asset and liability projections for the contracts falling within the scope of these requirements, excluding those contracts valued using the methodology pursuant to applicable requirements in VM-A and VM-C, over a broad range of stochastically generated projection scenarios described in Section 8 and using prudent estimate assumptions as required in Section 3.F herein.

2. The stochastic reserve amount for any group of contracts shall be determined as CTE70 of the scenario reserves following the requirements of Section 4, with the exception of groups of contracts for which a company elects the Deterministic Certification Option in Section 7.E, which shall be determined as the scenario reserve following the requirements of Section 4.

3. The reserve may be determined in aggregate across various groups of contracts as a single model segment when determining the stochastic reserve if the business and risks are not managed separately or are part of the same integrated risk management program. Aggregation is permitted if a resulting group of contracts (or model segment) follows the listed principles:
   a. Aggregate in a manner that is consistent with the company’s risk management strategy and reflects the likelihood of any change in risk offsets that could arise from shifts between product types, and
   b. Using prudent actuarial judgement, consider the following elements when aggregating groups of contracts: whether groups of contracts are part of the same portfolio (or different portfolios that interact), same integrated risk management system, administered/managed together

4. Do not aggregate groups of contracts for which the company elects to use the Deterministic Certification Option in Section 7.E with any groups of contracts that do not use such option.
5. To the extent that these limits on aggregation result in more than one model segment, the stochastic reserve shall equal the sum of the stochastic reserve amounts computed for each model segment and scenario reserve amounts computed for each model segment for which the company elects to use the Deterministic Certification Option in Section 7.E.

E. Exclusion Test

1. To the extent that certain groups of contracts pass one of the defined stochastic exclusion tests in Section 7.B, these groups of contracts may be valued using the methodology pursuant to applicable requirements in VM-A and VM-C, with the statutory maximum valuation rate for immediate annuities specified in Section 13.

   a. For dividend-paying contracts, a dividend liability shall be established upon following requirements in VM-A and VM-C, as described above, for the base contract.

Guidance Note: The intention of contracts that pass the stochastic exclusion test is to provide the option to value contracts under VM-A and VM-C. This may apply to pre-PBR CARVM requirements in accordance with Actuarial Guideline XXXIII (AG33) methodology with type A, B, C rates for SPIAs issued before 2018; AG33 methodology with pre-PBR VM-22 rates for SPIAs issued on/after 2018; Actuarial Guideline XXXV (AG35) pre-PBR methodology for Fixed Indexed Annuities; and AG33 methodology (with interest rate updates for modernization initiatives on new contracts) for non-SPIAs.

2. The approach for grouping contracts when performing the exclusion tests should follow the same principles that underlie the aggregation approach for model segments discussed for Stochastic Reserves in Section D above.

F. Allocation of the Aggregate Reserve to Contracts

The aggregate reserve shall be allocated to the contracts falling within the scope of these requirements using the method outlined in Section 12.

G. Prudent Estimate Assumptions:

1. With respect to the Stochastic Reserve in Section 3.C, the company shall establish the prudent estimate assumption for each risk factor in compliance with the requirements in Section 12 of Model #820 and must periodically review and update the assumptions as appropriate in accordance with these requirements.

2. The qualified actuary, to whom responsibility for this group of contracts is assigned, shall annually review relevant emerging experience for the purpose of assessing the appropriateness of the anticipated experience assumption. If the results of statistical testing or other testing indicate that previously anticipated experience for a given factor is inadequate, then the qualified actuary shall set a new, adequate, anticipated experience assumption for the factor.

3. To determine the prudent estimate assumptions, the stochastic reserve shall also follow the requirements in Sections 4 and 9 for asset assumptions, Section 10 for policyholder behavior assumptions, and Section 11 for mortality assumptions.
Section 4: Determination of Stochastic Reserve

A. Projection of Accumulated Deficiencies

1. General Description of Projection

   The projection of accumulated deficiencies shall be made ignoring federal income tax in both cash flows and discount rates, and it shall reflect the dynamics of the expected cash flows for the entire group of contracts, reflecting all product features, including any guarantees provided under the contracts using prudent estimate liability assumptions defined in Sections 10 and 11 and asset assumptions defined in Section 4.D. The company shall project cash flows including the following:

   a. Revenues received by the company including gross premiums received from the policyholder (including any due premiums as of the projected start date).

   b. All material benefits projected to be paid to policyholders—including, but not limited to, death claims, surrender benefits and withdrawal benefits—reflecting the impact of all guarantees and adjusted to take into account amounts projected to be charged to account values on general account business. Any guarantees, in addition to market value adjustments assessed on projected withdrawals or surrenders, shall be taken into account.

   Guidance Note: Amounts charged to account values on general account business are not revenue; examples include rider charges and expense charges.

   c. Non-Guaranteed Elements (NGE) cash flows as described in Section 10.J.

   d. Insurance company expenses (including overhead and investment expense), commissions, contractual fees and charges, and revenue-sharing income received by the company (net of applicable expenses).

   e. Net cash flows associated with any reinsurance.

   f. Cash flows from hedging instruments as described in Section 4.A.4.

   g. Cash receipts or disbursements associated with invested assets (other than policy loans) as described in Section 4.D.4, including investment income, realized capital gains and losses, principal repayments, asset default costs, investment expenses, asset prepayments, and asset sales.

   h. If modeled explicitly, cash flows related to policy loans as described in Section 10.I.2, including interest income, new loan payments and principal repayments.

   Guidance Note: Future net policy loan cash flows include: policy loan interest paid in cash plus repayments of policy loan principal, including repayments occurring at death or surrender (note that the future benefits in Section 4.A.1.b are before consideration of policy...
loans), less additional policy loan principal (but excluding policy loan interest that is added to the policy loan principal balance).

2. Grouping of Index Crediting Strategies

Index crediting strategies may be grouped for modeling using an approach that recognizes the investment guidelines and objectives of each index crediting strategy. In assigning each index crediting strategy to a grouping for projection purposes, the fundamental characteristics of the index crediting strategy shall be reflected, and the parameters shall have the appropriate relationship to the stochastically generated projection scenarios described in Section 8. The grouping shall reflect characteristics of the efficient frontier (i.e., returns generally cannot be increased without assuming additional risk).

Index accounts sharing similar index crediting strategies may also be grouped for modeling to an appropriately crafted proxy strategy normally expressed as a linear combination of recognized market indices, sub-indices or funds, in order to develop the investment return paths and associated interest crediting. Each index crediting strategy’s specific risk characteristics, associated index parameters, and relationship to the stochastically generated scenarios in Section 8 should be considered before grouping or assigning to a proxy strategy. Grouping and/or development of a proxy strategy may not be done in a manner that intentionally understates the resulting reserve.

3. Model Cells

Projections may be performed for each contract in force on the date of valuation or by assigning contracts into representative cells of model plans using all characteristics and criteria having a material impact on the size of the reserve. Assigning contracts to model cells may not be done in a manner that intentionally understates the resulting reserve.

4. Modeling of Hedges

a. For a company that does not have a future hedging program tied directly to the contracts falling under the scope of VM-22 stochastic reserve requirements:

   i. The company shall not consider the cash flows from any future hedge purchases or any rebalancing of existing hedge assets in its modeling.

   ii. Existing hedging instruments that are currently held by the company in support of the contracts falling under the scope of these requirements shall be included in the starting assets. The hedge assets may then be considered in one of two ways:

      a) Include the asset cash flows from any contractual payments and maturity values in the projection model; or

      b) No hedge positions—in which case the hedge positions held on the valuation date are replaced with cash and/or other general account assets in an amount equal to the aggregate market value of these hedge positions.
Guidance Note: If the hedge positions held on the valuation date are replaced with cash, then as with any other cash, such amounts may then be invested following the company’s investment strategy.

A company may switch from method a) to method b) at any time, but it may only change from b) to a) with the approval of the domiciliary commissioner.

b. For a company that has a future hedging program tied directly to the contracts falling under the scope of VM-22 stochastic reserve requirements:

i. For a hedging program with hedge payoffs that offset interest credits associated with indexed interest strategies (indexed interest credits):

a) In modeling cash flows, the company shall include the cash flows from future hedge purchases or any rebalancing of existing hedge assets that are intended solely to offset interest credits to policyholders.

b) Existing hedging instruments that are currently held by the company for this purpose in support of the contracts falling under the scope of these requirements shall be included in the starting assets. Existing hedging instruments that are currently held by the company for any other purpose should be modeled consistently with the requirements of Section 4.A.4.a.ii.

c) An Index Credit Hedge Margin for these instruments shall be reflected by reducing index interest credit hedge payoffs by a margin multiple that shall be justified by sufficient and credible company experience and be no less than \([X\%]\) multiplicatively of the interest credited. In the absence of sufficient and credible company experience, a margin of \([Y\%]\) shall be assumed. There is no cap on the index credit hedge margin if company experience indicates actual error is greater than \([Y\%]\). It is permissible to substitute stress-testing for sufficient and credible experience if such stress-testing comprehensively considers a robust range of future market conditions.

ii. For a company that hedges any contractual obligation or risks other than indexed interest credits, the detailed requirements for the modeling of hedges are defined in Section 9. The following requirements do not supersede the detailed requirements.

a) The appropriate costs and benefits of hedging instruments that are currently held by the company in support of the contracts falling under the scope of these requirements shall be included in the projections used in the determination of the stochastic reserve.

b) The projections shall take into account the appropriate costs and benefits of hedge positions expected to be held in the future.
Because models do not always accurately portray the results of hedge programs, the company shall, through back-testing and other means, assess the accuracy of the hedge modeling. The company shall determine a stochastic reserve as the weighted average of two CTE values: first, a CTE70 (“best efforts”) representing the company’s projection of all of the hedge cash flows, including future hedge purchases, and a second CTE70 (“adjusted”) which shall use only hedge assets held by the company on the valuation date and only future hedge purchases associated with indexed interest credited. These are discussed in greater detail in Section 9.

c) Consistent with Section 4.A.4.b.i., the index credit hedge margin for instruments associated with indexed interest credited shall be reflected by reducing hedge payoffs by a margin multiple as defined in Section 4.A.4.b.i.c).

d) The use of products not falling under the scope of these requirements as a hedge shall not be recognized in the determination of accumulated deficiencies.

**Guidance Note:** Section 4.A.4.b.i is intended to address common situations for products with index crediting strategies where the company only hedges index credits or clearly separates index credit hedging from other hedging. In this case the hedge positions are considered similarly to other fixed income assets supporting the contracts, and a margin is reflected rather than modeling using a CTE70 adjusted run with no future hedge purchases. If a company has a more comprehensive hedge strategy combining index credits, guaranteed benefit, and other risks (e.g., full fair value or economic hedging), an appropriate and documented bifurcation method should be used in the application of sections 4.A.4.b.i and 4.A.4.b.ii above for the hedge modeling and justification. Such bifurcation methods may quantify the specific risk exposure attributable to index credit liabilities versus other liabilities such as guaranteed living benefits, and apply such for the basis for allocation.

**Guidance Note:** The requirements of Section 4.A.4 govern the determination of reserves for annuity contracts and do not supersede any statutes, laws or regulations of any state or jurisdiction related to the use of derivative instruments for hedging purposes and should not be used in determining whether a company is permitted to use such instruments in any state or jurisdiction.

5. **Revenue Sharing**

If applicable, projections of accumulated deficiencies may include income from projected future revenue sharing, net of applicable projected expenses (net revenue-sharing income) if each of the requirements set forth in VM 21 Section 4.A.5 are met.

6. **Length of Projections**

Projections of accumulated deficiencies shall be run for as many future years as needed so that no materially greater reserve value would result from longer projection periods.
7. Interest Maintenance Reserve (IMR)

The IMR shall be handled consistently with the treatment in the company’s cash flow testing, and the amounts should be adjusted to a pre-tax basis.

B. Determination of Scenario Reserve

1. For a given scenario, the scenario reserve shall be determined using one of two methods described below:

   a) The starting asset amount plus the greatest present value, as of the projection start date, of the projected accumulated deficiencies; or

   Guidance Note: The greatest present value of accumulated deficiencies can be negative.

   b) The direct iteration method, where the scenario reserve is determined by solving for the amount of starting assets which, when projected along with all contract cash flows, result in the defeasement of all projected future benefits and expenses at the end of the projection horizon with no positive accumulated deficiencies at the end of any projection year during the projection period.

   The scenario reserve for any given scenario shall not be less than the cash surrender value in aggregate on the valuation date for the group of contracts modeled in the projection.

2. Discount Rates

   In determining the scenario reserve, unless using the direct iteration method pursuant to Section 4.B.1.b, the accumulated deficiencies shall be discounted at the NAER on additional assets, as defined in Section 4.B.3.

3. Determination of NAER on Additional Invested Asset Portfolio

   a. The additional invested asset portfolio for a scenario is a portfolio of general account assets as of the valuation date, outside of the starting asset portfolio, that is required in that projection scenario so that the projection would not have a positive accumulated deficiency at the end of any projection year. This portfolio may include only (i) General Account assets available to the company on the valuation date that do not constitute part of the starting asset portfolio; and (ii) cash assets.

   Guidance Note:

   Additional invested assets should be selected in a manner such that if the starting asset portfolio were revised to include the additional invested assets, the projection would not be expected to experience any positive accumulated deficiencies at the end of any projection year.

   It is assumed that the accumulated deficiencies for this scenario projection are known.

   b. To determine the NAER on additional invested assets for a given scenario:
i. Project the additional invested asset portfolio as of the valuation date to the end of the projection period,
   a) Investing any cash in the portfolio and reinvesting all investment proceeds using the company’s investment policy.
   b) Excluding any liability cash flows.
   c) Incorporating the appropriate returns, defaults and investment expenses for the given scenario.

ii. If the value of the projected additional invested asset portfolio does not equal or exceed the accumulated deficiencies at the end of each projection year for the scenario, increase the size of the initial additional invested asset portfolio as of the valuation date, and repeat the preceding step.

iii. Determine a vector of annual earned rates that replicates the growth in the additional invested asset portfolio from the valuation date to the end of the projection period for the scenario. This vector will be the NAER for the given scenario.

iv. If the depletion of assets within the projection results in an unreasonably high negative NAER upon borrowing, the NAER may be set to the assumed cost of borrowing associated with each projected time period, in accordance with Section 4.D.3.c, as a safe harbor.

Guidance Note: There are multiple ways to select the additional invested asset portfolio at the valuation date. Similarly, there are multiple ways to determine the earned rate vector. The company shall be consistent in its choice of methods, from one valuation to the next.

C. Projection Scenarios

1. Number of Scenarios

   The number of scenarios for which the scenario reserve shall be computed shall be the responsibility of the company, and it shall be considered to be sufficient if any resulting understatement in the stochastic reserve, as compared with that resulting from running additional scenarios, is not material.

2. Economic Scenario Generation

   Treasury Department interest rate curves, as well as investment return paths for index funds, equities, and fixed income assets shall be determined on a stochastic basis using the methodology described in Section 8. If the company uses a proprietary generator to develop scenarios, the company shall demonstrate that the resulting scenarios meet the requirements described in Section 8.
D. Projection of Assets

1. Starting Asset Amount
   a. For the projections of accumulated deficiencies, the value of assets at the start of
      the projection shall be set equal to the approximate value of statutory reserves at
      the start of the projection plus the allocated amount of PIMR attributable to the
      assets selected. Assets shall be valued consistently with their annual statement
      values. The amount of such asset values shall equal the sum of the following items,
      all as of the start of the projection:

      i. Any hedge instruments held in support of the contracts being valued; and

      ii. An amount of assets held in the general account equal to the approximate
          value of statutory reserves as of the start of the projections less the amount
          in (i).

   b. If the amount of initial general account assets is negative, the model should reflect
      a projected interest expense. General account assets chosen for use as described
      above shall be selected on a consistent basis from one reserve valuation hereunder
      to the next.

2. Valuation of Projected Assets

   For purposes of determining the projected accumulated deficiencies, the value of projected
   assets shall be determined in a manner consistent with their value at the start of the
   projection. For assets assumed to be purchased during a projection, the value shall be
   determined in a manner consistent with the value of assets at the start of the projection that
   have similar investment characteristics. However, for derivative instruments that are used
   in hedging and are not assumed to be sold during a particular projection interval, the
   company may account for them at an amortized cost in an appropriate manner elected by
   the company.

   **Guidance Note:** Accounting for hedge assets should recognize any methodology prescribed by a
   company’s state of domicile.

3. General Account Assets
   a. General account assets shall be projected, net of projected defaults, using assumed
      investment returns consistent with their book value and expected to be realized in
      future periods as of the date of valuation. Initial assets that mature during the
      projection and positive cash flows projected for future periods shall be invested in
      a manner that is representative of and consistent with the company’s investment
      policy, subject to the following requirements:

      i. The final maturities and cash flow structures of assets purchased in the
         model, such as the patterns of gross investment income and principal
         repayments or a fixed or floating rate interest basis, shall be determined
         by the company as part of the model representation;
ii. The combination of price and structure for fixed income investments and derivative instruments associated with fixed income investments shall appropriately reflect the projected Treasury Department curve along the relevant scenario and the requirements for gross asset spread assumptions stated below;

iii. For purchases of public non-callable corporate bonds, follow the requirements defined in VM-20 Sections 7.E, 7.F and 9.F. The prescribed spreads reflect current market conditions as of the model start date and grade to long-term conditions based on historical data at the start of projection year four;

iv. For transactions of derivative instruments associated with fixed income investments, reflect the prescribed assumptions in VM-20 Section 9.F for interest rate swap spreads;

v. For purchases of other fixed income investments, if included in the model investment strategy, set assumed gross asset spreads over U.S. Treasuries in a manner that is consistent with, and results in reasonable relationships to, the prescribed spreads for public non-callable corporate bonds and interest rate swaps.

b. Notwithstanding the above requirements, the model investment strategy and any non-prescribed asset spreads shall be adjusted as necessary so that the aggregate reserve is not less than that which would be obtained by substituting an alternative investment strategy in which all fixed income reinvestment assets are public non-callable corporate bonds with gross asset spreads, asset default costs, and investment expenses by projection year that are consistent with a credit quality blend of:

i. 5% Treasury

ii. 15% PBR credit rating 3 (Aa2/AA)

iii. 40% PBR credit rating 6 (A2/A)

iv. 40% PBR credit rating 9 (Baa/BBB)

c. Any disinvestment shall be modeled in a manner that is consistent with the company’s investment policy and that reflects the company’s cost of borrowing where applicable, provided that the assumed cost of borrowing is not lower than the rate at which positive cash flows are reinvested in the same time period, taking into account duration, ratings, and other attributes of the borrowing mechanism. Gross asset spreads used in computing market values of assets sold in the model shall be consistent with, but not necessarily the same as, the gross asset spreads in Section 4.D.4.a.ii and Section 4.D.4.a.iv, recognizing that initial assets that mature during the projection may have different characteristics than modeled reinvestment assets.
**Guidance Note:** This limitation is being referred to Life Actuarial (A) Task Force for review. The simple language above “provided that the assumed cost of borrowing is not lower than the rate at which positive cash flows are reinvested in the same time period” is not intended to impose a literal requirement. It is intended to reflect a general concept to prevent excessively optimistic borrowing assumptions. It is recognized that borrowing parameters and rules can be complicated, such that modeling limitations may not allow for literal compliance, in every time step, as long as the reserve is not materially affected. However, if the company is unable to fully apply this restriction, prudence dictates that a company shall not allow borrowing assumptions to materially reduce the reserve.

4. **Cash Flows from Invested Assets**
   
a. Cash flows from general account fixed income assets, including starting and reinvestment assets, shall be reflected in the projection as follows:
   
i. Model gross investment income and principal repayments in accordance with the contractual provisions of each asset and in a manner consistent with each scenario.
   
ii. Reflect asset default costs as prescribed in VM-20 Section 9.F and anticipated investment expenses through deductions to the gross investment income.
   
iii. Model the proceeds arising from modeled asset sales and determine the portion representing any realized capital gains and losses.
   
iv. Reflect any uncertainty in the timing and amounts of asset cash flows related to the paths of interest rates, equity returns or other economic values directly in the projection of asset cash flows. Asset defaults are not subject to this requirement, since asset default assumptions must be determined by the prescribed method in VM-20 Sections 7.E, 7.F and 9.F.
   
   b. Cash flows from general account index funds and equity assets—i.e., non-fixed income assets having substantial volatility of returns, such as common stocks and real estate— including starting and reinvestment assets, shall be reflected in the projection as follows:
   
i. Determine the grouping for asset categories and the allocation of specific assets to each category in a manner that is consistent with that used for index crediting strategies, as discussed in Section 4.A.2.
   
ii. Project the gross investment return including realized and unrealized capital gains in a manner that is consistent with the stochastically generated scenarios.
   
iii. Model the timing of an asset sale in a manner that is consistent with the investment policy of the company for that type of asset. Reflect expenses through a deduction to the gross investment return using prudent estimate assumptions.
c. Cash flows for each projection interval for policy loan assets shall follow the requirements in Section 10.I.

E. Projection of Annuitization Benefits

1. Assumed Annuitization Purchase Rates

   a. For payouts specified at issue (such as single premium immediate annuities, deferred income annuities, and certain structured settlements), such payout rates shall reflect the payout rate specified in the contract.

   b. For purposes of projecting future elective annuitization benefits and withdrawal amounts from GMWBs, the projected annuitization purchase rates shall be determined assuming that market interest rates available at the time of election are the interest rates used to project general account assets, as determined in Section 4.D.4. In contrast, for payouts specified at issue, the payout rates modeled should be consistent with those specified in the contract.

2. Projected Election of GMIBs, GMWBs and Other Annuitization Options

   For contracts projected to elect future annuitization options (including annuitizations stemming from the election of a GMIB) or for projections of GMWB benefits once the account value has been depleted, the projections may assume the contract will stay in force, the projected periodic payments are paid, and the associated maintenance expenses are incurred.

F. Frequency of Projection and Time Horizon

1. Use of an annual cash-flow frequency ("timestep") is generally acceptable for benefits/features that are not sensitive to projection frequency. The lack of sensitivity to projection frequency should be validated by testing wherein the company should determine that the use of a more frequent—i.e., shorter—time step does not materially increase reserves. A more frequent time increment should always be used when the product features are sensitive to projection period frequency.

2. Care must be taken in simulating fee income and expenses when using an annual time step. It is also important that the frequency of the investment return model be linked appropriately to the projection horizon in the liability model. In particular, the horizon should be sufficiently long so as to capture the vast majority of costs (on a present value basis) from the scenarios.

   Guidance Note: As a general guide, the forecast horizon should not be less than 20 years.

G. Compliance with ASOPs

When determining a stochastic reserve, the analysis shall conform to the ASOPs as promulgated from time to time by the ASB.

Under these requirements, an actuary will make various determinations, verifications and certifications. The company shall provide the actuary with the necessary information sufficient to
permit the actuary to fulfill the responsibilities set forth in these requirements and responsibilities arising from each applicable ASOP.
Section 5: Reinsurance Ceded and Assumed

A. Treatment of Reinsurance Ceded in the Aggregate Reserve

1. Aggregate Reserve Pre- and Post-Reinsurance Ceded

As noted in Section 3.B, the aggregate reserve is determined both pre-reinsurance ceded and post-reinsurance ceded. Therefore, it is necessary to determine the components needed to determine the aggregate reserve—i.e., the stochastic reserve and/or the reserve amount valued using requirements in VM-A and VM-C, as applicable—on both bases. Sections 5.A.2 and 5.A.3 discuss adjustments to inputs necessary to determine these components on both a post-reinsurance ceded and a pre-reinsurance ceded basis. Note that due allowance for reasonable approximations may be used where appropriate.

2. Stochastic Reserve

a. In order to determine the aggregate reserve post-reinsurance ceded, accumulated deficiencies, scenario reserves, and the resulting stochastic reserve shall be determined reflecting the effects of reinsurance treaties that meet the statutory requirements that would allow the treaty to be accounted for as reinsurance within statutory accounting. This involves including, where appropriate, all projected reinsurance premiums or other costs and all reinsurance recoveries, where the reinsurance cash flows reflect all the provisions in the reinsurance agreement, using prudent estimate assumptions.

i. All significant terms and provisions within reinsurance treaties shall be reflected. In addition, it shall be assumed that each party is knowledgeable about the treaty provisions and will exercise them to their advantage.

Guidance Note: Renegotiation of the treaty upon the expiration of an experience refund provision or at any other time shall not be assumed if such would be beneficial to the company and not beneficial to the counterparty. This is applicable to both the ceding party and assuming party within a reinsurance arrangement.

ii. If the company has knowledge that a counterparty is financially impaired, the company shall establish a margin for the risk of default by the counterparty. In the absence of knowledge that the counterparty is financially impaired, the company is not required to establish a margin for the risk of default by the counterparty.

iii. A company shall include the cash flows from a reinsurance agreement or amendment in calculating the aggregate reserve if such qualifies for credit in compliance with Appendix A-791 of the Accounting Practices and Procedures Manual. If a reinsurance agreement or amendment does not qualify for credit for reinsurance but treating the reinsurance agreement or amendment as if it did so qualify would result in a reduction to the company’s surplus, then the company shall increase the minimum reserve by the absolute value of such reductions in surplus.

b. In order to determine the stochastic reserve on a pre-reinsurance ceded basis, accumulated deficiencies, scenario reserves, and the resulting stochastic reserve shall be determined ignoring the effects of reinsurance ceded within the projections. Different approaches may be used to determine the starting assets on the ceded portion of the contracts, dependent upon the characteristics of a given treaty:

i. For a standard coinsurance treaty, where the assets supporting the ceded liabilities were transferred to the assuming reinsurer, one acceptable approach involves a projection.
based on using starting assets on the ceded portion of the policies that are similar to those supporting the retained portion of the ceded policies or supporting similar types of policies. Scaling up each asset supporting the retained portion of the contract is also an acceptable method.

**Guidance Note:** For standard pro rata insurance treaties (does not include experience refunds), where allocated expenses are similar to the renewal expense allowance, reflecting the quota share applied to the present value of future reinsurance cash flows pertaining to the reinsured block of business may be considered as a possible approach to determine the ceded reserves.

ii. Alternatively, a treaty may contain an identifiable portfolio of assets associated with the ceded liabilities. This could be the case for several forms of reinsurance: funds withheld coinsurance; modified coinsurance; coinsurance with a trust. To the extent these assets would be available to the cedant, an acceptable approach could involve modeling this portfolio of assets. To the extent that these assets were insufficient to defease the ceded liabilities, the modeling would partially default to the approach discussed for a standard coinsurance treaty. To the extent these assets exceeded what might be needed to defease the ceded liabilities (perhaps an over collateralization requirement in a trust), the inclusion of such assets shall be limited.

**Guidance Note:** Section 3.5.2 in ASOP No. 52, *Principle-Based Reserves for Life Products under the NAIC Valuation Manual*, provides possible methods for constructing a hypothetical pre-reinsurance asset portfolio, if necessary, for purposes of the pre-reinsurance reserve calculation.

c. An assuming company shall use assumptions to project cash flows to and from ceding companies that reflect the assuming company’s experience for the business segment to which the reinsured policies belong and reflect the terms of the reinsurance agreement.

3. Reserve Determined Upon Passing the Exclusion Test

If a company passes the stochastic exclusion test and elects to use a methodology pursuant to applicable Sections VM-A and VM-C, as allowed in Section 3.E, it is important to note that the methodology produces reserves on a pre-reinsurance ceded basis. Therefore, the reserve must be adjusted for any reinsurance ceded accordingly. In addition, reserves valued under applicable Sections in VM-A and VM-C, unadjusted for reinsurance, shall be applied to the contracts falling under the scope of these requirements to determine the aggregate reserve prior to reinsurance.

It should be noted that the pre-reinsurance and post-reinsurance reserves may result in different outcomes for the exclusion test. In particular, it is possible that the pre-reinsurance reserves would pass the relevant exclusion test (and allow the use of VM-A and VM-C) while the post-reinsurance reserves might not.

4. To Be Determined
Section 7: Exclusion Testing

A. Stochastic Exclusion Test Requirement Overview

1. The company may elect to exclude one or more groups of contracts from the stochastic reserve calculation if the stochastic exclusion test (SET) is satisfied for that group of contracts. The company has the option to calculate or not calculate the SET.

   a. If the company does not elect to calculate the SET for one or more groups of contracts, or the company calculates the SET and fails the test for such groups of contracts, the reserve methodology described in Section 4 shall be used for calculating the aggregate reserve for those groups of contracts.

   b. If the company elects to calculate the SET for one or more groups of contracts, and passes the test for such groups of contracts, then the company shall choose whether or not to use the reserve methodology described in Section 4 for those groups of contracts. If the reserve methodology described in Section 4 is not used for one or more groups of contracts, then the company shall use the reserve methodology pursuant to applicable requirements in VM-A and VM-C to calculate the aggregate reserve for those groups of contracts.

   c. A company may not exclude a group of contracts from the stochastic reserve requirements if there are one or more future hedging programs associated with the contracts, with the exception of hedging programs solely supporting index credits as described in Section 9.A.1.

B. Types of Stochastic Exclusion Tests

Groups of contracts pass the SET if one of the following is met:

1. Stochastic Exclusion Ratio Test (SERT)—Annually the company demonstrates that the groups of contracts pass the SERT defined in Section 7.C.

2. Stochastic Exclusion Demonstration Test—In the first year and at least once every three calendar years thereafter, the company provides a demonstration in the PBR Actuarial Report as specified in Section 7.D.

3. SET Certification Method—For groups of contracts that do not have guaranteed living benefits, future hedging programs, or pension risk transfer business in the first year and at least every third calendar year thereafter, the company provides a certification by a qualified actuary that the group of contracts is not subject to material aggregate risk levels across interest rate risk, longevity risk, or asset return volatility risk (i.e., the risk on non-fixed-income investments having substantial volatility of returns, such as common stocks and real estate investments). The company shall provide the certification and documentation supporting the certification to the commissioner upon request.

Guidance Note: The qualified actuary should develop documentation to support the actuarial certification that presents his or her analysis clearly and in detail sufficient for another actuary to understand the analysis and reasons for the actuary’s conclusion that the group of contracts is not subject to material interest rate risk, longevity risk, or asset return volatility risk. Examples of methods a qualified actuary could use to support the actuarial certification include, but are not limited to:
a) A demonstration that using requirements under VM-A and VM-C for the group of contracts calculated are at least as great as the assets required to support the group of contracts using the company’s cash-flow testing model under each of the 16 scenarios identified in this section or alternatively each of the New York seven scenarios.

b) A demonstration that the group of contracts passed the SERT within 36 months prior to the valuation date and the company has not had a material change in its interest rate risk.

c) A qualitative risk assessment of the group of contracts that concludes that the group of contracts does not have material interest rate risk or asset return volatility. Such assessment would include an analysis of product guarantees, the company’s non-guaranteed elements (NGEs) policy, assets backing the group of contracts and the company’s investment strategy.

C. Stochastic Exclusion Ratio Test

1. In order to exclude a group of contracts from the stochastic reserve requirements under the stochastic exclusion ratio test (SERT), a company shall demonstrate that the ratio of 
   \( \frac{b - a}{a} \) is less than \( [x\%] \) where:

   a. \( a \) = the adjusted scenario reserve described in Paragraph C.2.a.i below using economic scenario 9, the baseline economic scenario, as described in Appendix 1.E of VM-20.

   b. \( b \) = the largest adjusted scenario reserve described in Paragraph C.2.b below under any of the other 15 economic scenarios described in Appendix 1.E of VM-20 under both \([95\%]\) and \([105\%]\) of anticipated experience mortality excluding margins.

Guidance Note: Note that the numerator should be the largest adjusted scenario reserve for scenarios other than the baseline economic scenario, minus the adjusted scenario reserve for the baseline economic scenario. This is not necessarily the same as the biggest difference from the adjusted scenario reserve for the baseline economic scenario, or the absolute value of the biggest difference from the adjusted scenario reserve for the baseline economic scenario, both of which could lead to an incorrect test result.

2. In calculating the ratio in subsection (1) above:

   a. The company shall calculate an adjusted scenario reserve for the group of contracts for the 16 scenarios that is equal to either (i) or (ii) below:

      i. The scenario reserve defined in Section 4, but with the following differences:

         a) Using anticipated experience assumptions with no margins, with the exception of mortality factors described in Paragraph C.1.b of this section.

         b) Using the interest rates and equity return assumptions specific to each scenario.

         c) Using NAER and discount rates defined in Section 4 specific to each scenario to discount the cash flows.
d) Shall reflect future mortality improvement in line with anticipated experience assumptions.

e) Shall not reflect correlation between longevity and economic risks.

ii. The gross premium reserve developed from the cash flows from the company’s asset adequacy analysis models, using the experience assumptions of the company’s cash-flow analysis, but with the following differences:

a) Using the interest rates and equity return assumptions specific to each scenario.

b) Using the mortality scalars described in Paragraph C.1.b of this section.

c) Using the methodology to determine NAER and discount rates defined in Section 4 specific to each scenario to discount the cash flows, but using the company’s cash-flow testing assumptions for default costs and reinvestment earnings.

b. The company shall use the most current 16 economic scenarios published by the NAIC. The methodology for creating these scenarios can be found in Appendix 1 of VM-20.

c. The company shall use assumptions within each scenario that are dynamically adjusted as appropriate for consistency with each tested scenario.

d. The company may not group together contract types with significantly different risk profiles for purposes of calculating this ratio.

e. If the company has reinsurance arrangements that are pro rata coinsurance and do not materially impact the interest rate risk, longevity risk, or asset return volatility in the contract, then the company may elect to not conduct the exclusion test under a pre-reinsurance-ceded basis upon determining the pre-reinsurance reserve-ceded aggregate reserve.

3. If the ratio calculated in this section is less than [%] pre-non-proportional reinsurance, but is greater than [%] post-non-proportional reinsurance, the group of contracts will still pass the SERT if the company can demonstrate that the sensitivity of the adjusted scenario reserve to economic scenarios is comparable pre- and post-non-proportional reinsurance.

a. An example of an acceptable demonstration:

i. For convenience in notation • SERT = the ratio (b–a)/a defined in Section 7.C.1 above

a) The pre-non-proportional reinsurance results are “gross of non-proportional,” with a subscript “gn,” so denoted SERT_{gn}

b) The post-non-proportional results are “net of non-proportional,” with subscript “nn,” so denoted SERT_{nn}
ii. If a block of business being tested is subject to one or more non-proportional reinsurance cessions as well as other forms of reinsurance, such as pro rata coinsurance, take “gross of non-proportional” to mean net of all prorata reinsurance but ignoring the non-proportional contract(s), and “net of non-proportional” to mean net of all reinsurance contracts. That is, treat non-proportional reinsurance as the last reinsurance in, and compute certain values below with and without that last component.

iii. So, if \( SERT_{gn} \leq [x] \) but \( SERT_{nn} > [x] \), then compute the largest percent increase in reserve (LPIR) = \((b-a)/a\), both “gross of non-proportional” and “net of non-proportional.”

\[
LPIR_{gn} = \frac{b_{ny} - a_{y}}{a_{gn}} \\
LPIR_{nn} = \frac{b_{ny} - a_{y}}{a_{nn}}
\]

Note that the scenario underlying \( b_{gn} \) could be different from the scenario underlying \( b_{nn} \).

If \( SERT_{gn} \times LPIR_{nn}/LPIR_{gn} < [x] \), then the block of contracts passes the SERT.

b. Another more qualitative approach is to calculate the adjusted scenario reserves for the 16 scenarios both gross and net of reinsurance to demonstrate that there is a similar pattern of sensitivity by scenario.

4. The SERT may not be used for a group of contracts if, using the current year’s data, (i) the stochastic exclusion demonstration test defined in Section 7.D had already been attempted using the method in this section and did not pass; or (ii) the qualified actuary had actively undertaken to perform the certification method in this section and concluded that such certification could not legitimately be made.

D. Stochastic Exclusion Demonstration Test

1. In order to exclude a group of contracts from the stochastic reserve requirements using the methodology in this section, the company must provide a demonstration in the PBR Actuarial Report in the first year and at least once every three calendar years thereafter that complies with the following:

a. The demonstration shall provide a reasonable assurance that if the stochastic reserve was calculated on a stand-alone basis for the group of contracts subject to the stochastic reserve exclusion, the resulting stochastic reserve for those groups of contracts would not be higher than the statutory reserve determined pursuant to the applicable requirements in VM-A and VM-C. The demonstration shall take into account whether changing conditions over the current and two subsequent calendar years would be likely to change the conclusion to exclude the group of contracts from the stochastic reserve requirements.

b. If, as of the end of any calendar year, the company determines the aggregate reserve for the group of contracts no longer adequately provides for all material risks, the exclusion shall be discontinued, and the company fails the SERT for those contracts.
c. The demonstration may be based on an analysis from a date that precedes the valuation date for the initial year to which it applies if the demonstration includes an explanation of why the use of such a date will not produce a material change in the outcome, as compared to results based on an analysis as of the valuation date.

d. The demonstration shall provide an effective evaluation of the residual risk exposure remaining after risk mitigation techniques, such as derivative programs and reinsurance.

2. The company may use one of the following or another method acceptable to the insurance commissioner to demonstrate compliance with subsection 7.D.1 above:

   a. Demonstrate that the statutory reserve calculated in accordance with VM-A and VM-C is greater than the stochastic reserve calculated on a stand-alone basis.

   b. Demonstrate that the statutory reserve calculated in accordance with VM-A and VM-C is greater than the scenario reserve that results from each of a sufficient number of adverse deterministic scenarios.

   c. Demonstrate that the statutory reserve calculated in accordance with VM-A and VM-C is greater than the stochastic reserve calculated on a stand-alone basis, but using a representative sample of contracts in the stochastic reserve calculations.

   d. Demonstrate that any risk characteristics that would otherwise cause the stochastic reserve calculated on a stand-alone basis to exceed the statutory reserve calculated in accordance with VM-A and VM-C, are not present or have been substantially eliminated through actions such as hedging, investment strategy, reinsurance or passing the risk on to the policyholder by contract provision.

E. Deterministic Certification Option

1. The company has the option to determine the stochastic reserve for a group of contracts using a single deterministic economic scenario, subject to the following conditions.

   a. The company certifies that economic conditions do not materially influence anticipated contract holder behavior for the group of policies. Examples of contract holder options that are materially influenced by economic conditions include surrender benefits, recurring premium payments, and guaranteed living benefits.

   b. The company certifies that the group of policies is not supported by a reinvestment strategy that contains future hedge purchases.

   c. The company must perform and disclose results from the stochastic exclusion ratio test following the requirements in Section 7.C, thereby disclosing the scenario reserve volatility across various economic scenarios.
d. The company must disclose a description of contracts and associated features in the certification.

Drafting Note: Consider revisiting Paragraph E.1.c to possibly either require i) falling below a preset threshold for the exclusion ratio test under a single longevity/mortality scenario; or ii) to pass the exclusion test if longevity is not included as part of the ratio test.

2. The stochastic reserve for the group of contracts under the Deterministic Certification Option is determined as follows:

   a. Cash flows are projected in compliance with the applicable requirements in Section 4, Section 5, Section 10, and Section 11 of VM-22 over a single economic scenario (scenario 12 found in Appendix 1 of VM-20).

   b. The stochastic reserve equals the scenario reserve following the requirements for Section 4.

Guidance Note: The Deterministic Certification Option is intended to provide a non-stochastic option for Single Premium Immediate Annuities (SPIAs) and similar payout annuity products that contain limited or no optionality in the asset and liability cash flow projections.
Section 9: Modeling Hedges under a Future Hedging Strategy

A. Initial Considerations

1. This section applies to modeling of hedges other than situations where the company (a) only hedges index credits, or (b) clearly separates index credit hedging from other hedging. In those situations, the modeling of hedges supporting index credits can be simplified including applying an index credit hedge margin, following the requirements in Section 4.A.4.b.i.

2. The appropriate costs and benefits of hedging instruments that are currently held by the company in support of the contracts falling under the scope of these requirements shall be included in the calculation of the stochastic reserve, determined in accordance with Section 3.D and Section 4.D.

3. The company shall take into account the costs and benefits of hedge positions expected to be held by the company in the future along each scenario. Company management is responsible for developing, documenting, executing and evaluating the investment strategy for future hedge purchases. Prior to reflection in projections, the strategy for future hedge purposes shall be the actual practice of the company for a period of time not less than [6] months.

4. For this purpose, the investment assets refer to all the assets, including derivatives supporting covered products and guarantees. This also is referred to as the investment portfolio. The investment strategy is the set of all asset holdings at all points in time in all scenarios. The hedging portfolio, which also is referred to as the hedging assets, is a subset of the investment assets. The hedging strategy is the hedging asset holdings at all points in time in all scenarios. There is no attempt to distinguish what is the hedging portfolio and what is the investment portfolio in this section. Nor is the distinction between investment strategy and hedging strategy formally made here. Where necessary to give effect to the intent of this section, the requirements applicable to the hedging portfolio or the hedging strategy are to apply to the overall investment portfolio and investment strategy.

5. This particularly applies to restrictions on the reasonableness or acceptability of the models that make up the stochastic cash-flow model used to perform the projections, since these restrictions are inherently restrictions on the joint modeling of the hedging and non-hedging portfolio. To give effect to these requirements, they must apply to the overall investment strategy and investment portfolio.

B. Modeling Approaches

1. The analysis of the impact of the hedging strategy on cash flows is typically performed using either one of two types of methods as described below. Although a hedging strategy normally would be expected to reduce risk provisions, the nature of the hedging strategy and the costs to implement the strategy may result in an increase in the amount of the stochastic reserve otherwise calculated.

2. The fundamental characteristic of the first type of method, referred to as the “explicit method,” is that hedging positions and their resulting cash flows are included in the stochastic cash-flow model used to determine the scenario reserve, as discussed in Section 3.D, for each scenario.
3. The fundamental characteristic of the second type of method, referred to as the “implicit method,” is that the effectiveness of the current hedging strategy on future cash flows is evaluated, in part or in whole, outside of the stochastic cash-flow model. There are multiple ways that this type of modeling can be implemented. In this case, the reduction to the stochastic reserve otherwise calculated should be commensurate with the degree of effectiveness of the hedging strategy in reducing accumulated deficiencies otherwise calculated.

4. Regardless of the methodology used by the company, the ultimate effect of the current hedging strategy (including currently held hedge positions) on the stochastic reserve needs to recognize all risks, associated costs, imperfections in the hedges and hedging mismatch tolerances associated with the hedging strategy. The risks include, but are not limited to: basis, gap, price, parameter estimation and variation in assumptions (mortality, persistency, withdrawal, annuitization, etc.). Costs include, but are not limited to: transaction, margin (opportunity costs associated with margin requirements) and administration. In addition, the reduction to the stochastic reserve attributable to the hedging strategy may need to be limited due to the uncertainty associated with the company’s ability to implement the hedging strategy in a timely and effective manner. The level of operational uncertainty varies indirectly with the amount of time that the new or revised strategy has been in effect or mock tested.

Guidance Note: No hedging strategy is perfect. A given hedging strategy may eliminate or reduce some but not all risks, transform some risks into others, introduce new risks, or have other imperfections. For example, a delta-only hedging strategy does not adequately hedge the risks measured by the “Greeks” other than delta.

5. A safe harbor approach is permitted for those companies whose modeled hedge assets comprise only linear instruments not sensitive to implied volatility. For companies with option-based hedge strategies, electing this approach would require representing the option-based portion of the strategy as a delta-rho two-Greek hedge program. The normally modeled option portfolio would be replaced with a set of linear instruments that have the same first-order Greeks as the original option portfolio.

C. Calculation of Stochastic Reserve (Reported)

1. The company shall calculate CTE70 (best efforts)—the results obtained when the CTE70 is based on incorporating the modeling of hedges (including both currently held and future hedge positions) into the stochastic cash-flow model on a best efforts basis, including all of the factors and assumptions needed to model the hedges (e.g., stochastic implied volatility). The determination of CTE70 (best efforts) may utilize either explicit or implicit modeling techniques.

2. The company shall calculate a CTE70 (adjusted) by recalculating the CTE70 assuming the company has no hedging strategy except those to hedge interest credits and hedge assets held by the company on the valuation date, therefore following the requirements of Section 4.A.4.a and 4.A.4.b.i.

3. Because most models will include at least some approximations or idealistic assumptions, CTE70 (best efforts) may overstate the impact of the hedging strategy. To compensate for potential overstatement of the impact of the hedging strategy, the value for the stochastic reserve is given by:

\[
\text{Stochastic reserve} = \text{CTE70 (best efforts)} + E \times \max[0, \text{CTE70 (adjusted)} - \text{CTE70 (best efforts)}]
\]
4. The company shall specify a value for $E$ (the “error factor”) in the range from 5% to 100% to reflect the company’s view of the potential error resulting from the level of sophistication of the stochastic cash-flow model and its ability to properly reflect the parameters of the hedging strategy (i.e., the Greeks being covered by the strategy), as well as the associated costs, risks and benefits. The greater the ability of the stochastic model to capture all risks and uncertainties, the lower the value of $E$. The value of $E$ may be as low as 5% only if the model used to determine the CTE70 (best efforts) effectively reflects all of the parameters used in the hedging strategy. If certain economic risks are not hedged, yet the model does not generate scenarios that sufficiently capture those risks, $E$ must be in the higher end of the range, reflecting the greater likelihood of error. Likewise, simplistic hedge cash-flow models shall assume a higher likelihood of error.

5. The company shall conduct a formal back-test, based on an analysis of at least the most recent 12 months, to assess how well the model is able to replicate the hedging strategy in a way that supports the determination of the value used for $E$.

6. Such a back-test shall involve one of the following analyses:

a. For companies that model hedge cash flows directly (“explicit method”), replace the stochastic scenarios used in calculating the CTE70 (best efforts) with a single scenario that represents the market path that actually manifested over the selected back-testing period and compare the projected hedge asset gains and losses against the actual hedge asset gains and losses – both realized and unrealized – observed over the same time period. For this calculation, the model assumptions may be replaced with parameters that reflect actual experience during the back-testing period. In order to isolate the comparison between the modeled hedge results and actual hedge results for this calculation, the projected liabilities should accurately reflect the actual liabilities throughout the back-testing period; therefore, adjustments that facilitate this accuracy (e.g. reflecting actual experience instead of model assumptions, including new business, etc.) are permissible.

   To support the choice of a low value of $E$, the company should ascertain that the projected hedge asset gains and losses are within close range of 100% (e.g., 80–125%) of the actual hedge asset gains and losses. The company may also support the choice of a low value of $E$ by achieving a high R-squared (e.g., 0.80 or higher) when using a regression analysis technique.

b. For companies that model hedge cash flows implicitly by quantifying the cost and benefit of hedging using the fair value of the hedged item (an “implicit method” or “cost of reinsurance method”), calculate the delta, rho and vega coverage ratios in each month over the selected back-testing period in the following manner:

   i. Determine the hedge asset gains and losses—both realized and unrealized—incurred over the month attributable to equity, interest rate, and implied volatility movements.

   ii. Determine the change in the fair value of the hedged item over the month attributable to equity, interest rate, and implied volatility movements. The hedged item should be defined in a manner that reflects the proportion of risks hedged (e.g., if a company elects to hedge 50% of a contract’s market risks, it should quantify the fair value of the hedged item as 50% of the fair value of the contract).

   iii. Calculate the delta coverage ratio as the ratio between (i) and (ii) attributable to equity movements.
iv. Calculate the rho coverage ratio as the ratio between (i) and (ii) attributable to interest rate movements.

v. Calculate the vega coverage ratio as the ratio between (i) and (ii) attributable to implied volatility movements.

vi. To support the company’s choice of a low value of E, the company should be able to demonstrate that the delta and rho coverage ratios are both within close range of 100% (e.g., 80–125%) consistently across the back-testing period.

vii. In addition, the company should be able to demonstrate that the vega coverage ratio is within close range of 100% in order to use the prevailing implied volatility levels as of the valuation date in quantifying the fair value of the hedged item for the purpose of calculating CTE70 (best efforts). Otherwise, the company shall quantify the fair value of the hedged item for the purpose of calculating CTE70 (best efforts) in a manner consistent with the realized volatility of the scenarios captured in the CTE (best efforts).

c. Companies that do not model hedge cash flows explicitly, but that also do not use the implicit method as outlined in Section 9.C.6.b above, shall conduct the formal back-test in a manner that allows the company to clearly illustrate the appropriateness of the selected method for reflecting the cost and benefit of hedging, as well as the value used for E.

7. A company that does not have 12 months of experience to date shall set E to a value that reflects the amount of experience available, and the degree and nature of any change to the hedge program. For a material change in strategy, with no history, E should be at least 0.50. However, E may be lower than 0.50 if some reliable experience is available and/or if the change in strategy is a refinement rather than a substantial change in strategy.

Guidance Note: The following examples are provided as guidance for determining the E factor when there has been a change to the hedge program:

- The error factor should be temporarily large (e.g., ≥ 50%) for substantial changes in hedge methodology (e.g., moving from a fair-value based strategy to a stop-loss strategy) where the company has not been able to provide a meaningful simulation of hedge performance based on the new strategy.

- A temporary moderate increase (e.g., 15–30%) in error factor should be used for substantial modifications to hedge programs or modeling where meaningful simulation has not been created (e.g., adding second-order hedging, such as gamma or rate convexity).

- No increase in the error factor may be used for incremental modifications to the hedge strategy (e.g., adding death benefits to a program that previously covered only living benefits, or moving from swaps to Treasury Department futures).

D. Specific Considerations and Requirements

1. As part of the process of choosing a methodology and assumptions for estimating the future effectiveness of the current hedging strategy (including currently held hedge positions) for
purposes of reducing the stochastic reserve, the company should review actual historical hedging effectiveness. The company shall evaluate the appropriateness of the assumptions on future trading, transaction costs, other elements of the model, the strategy, the mix of business and other items that are likely to result in materially adverse results. This includes an analysis of model assumptions that, when combined with the reliance on the hedging strategy, are likely to result in adverse results relative to those modeled. The parameters and assumptions shall be adjusted (based on testing contingent on the strategy used and other assumptions) to levels that fully reflect the risk based on historical ranges and foreseeable future ranges of the assumptions and parameters. If this is not possible by parameter adjustment, the model shall be modified to reflect them at either anticipated experience or adverse estimates of the parameters.

2. A discontinuous hedging strategy is a hedging strategy where the relationships between the sensitivities to equity markets and interest rates (commonly referred to as the Greeks) associated with the guaranteed contract holder options embedded in the fixed indexed annuities and other in-scope products and these same sensitivities associated with the hedging assets are subject to material discontinuities. This includes, but is not limited to, a hedging strategy where material hedging assets will be obtained when the fixed indexed annuity account balances reach a predetermined level in relationship to the guarantees. Any hedging strategy, including a delta hedging strategy, can be a discontinuous hedging strategy if implementation of the strategy permits material discontinuities between the sensitivities to equity markets and interest rates associated with the guaranteed contract holder options embedded in the fixed indexed annuities and other in-scope products and these same sensitivities associated with the hedging assets. There may be scenarios that are particularly costly to discontinuous hedging strategies, especially where those result in large discontinuous changes in sensitivities (Greeks) associated with the hedging assets. Where discontinuous hedging strategies contribute materially to a reduction in the stochastic reserve, the company must evaluate the interaction of future trigger definitions and the discontinuous hedging strategy, in addition to the items mentioned in the previous paragraph. This includes an analysis of model assumptions that, when combined with the reliance on the discontinuous hedging strategy, may result in adverse results relative to those modeled.

3. A strategy that has a strong dependence on acquiring hedging assets at specific times that depend on specific values of an index or other market indicators may not be implemented as precisely as planned.

4. The combination of elements of the stochastic cash-flow model—including the initial actual market asset prices, prices for trading at future dates, transaction costs and other assumptions—should be analyzed by the company as to whether the stochastic cash-flow model permits hedging strategies that make money in some scenarios without losing a reasonable amount in some other scenarios. This includes, but is not limited to:
   a. Hedging strategies with no initial investment that never lose money in any scenario and in some scenarios make money.
   b. Hedging strategies that, with a given amount of initial money, never make less than accumulation at the one-period risk-free rates in any scenario but make more than this in one or more scenarios.

5. If the stochastic cash-flow model allows for such situations, the company should be satisfied that the results do not materially rely directly or indirectly on the use of such strategies. If the results do materially rely directly or indirectly on the use of such strategies, the strategies may not be used to reduce the stochastic reserve otherwise calculated.
6. In addition to the above, the method used to determine prices of financial instruments for trading in scenarios should be compared to actual initial market prices. In addition to comparisons to initial market prices, there should be testing of the pricing models that are used to determine subsequent prices when scenarios involve trading financial instruments. This testing should consider historical relationships. For example, if a method is used where recent volatility in the scenario is one of the determinants of prices for trading in that scenario, then that model should approximate actual historic prices in similar circumstances in history.
Section 10: Guidance and Requirements for Setting Contract Holder Behavior Prudent Estimate Assumptions

A. General

Contract holder behavior assumptions encompass actions such as lapses, withdrawals, transfers, recurring deposits, benefit utilization, option election, etc. Contract holder behavior is difficult to predict accurately, and variance in behavior assumptions can significantly affect the results. In the absence of relevant and fully credible empirical data, the company should set behavior assumptions as guided by Principle 3 in Section 1.B.

In setting behavior assumptions, the company should examine, but not be limited by, the following considerations:

1. Behavior can vary by product, market, distribution channel, index performance, interest credited (current and guaranteed rates), time/product duration, etc.
2. Options embedded in the product may affect behavior.
3. Utilization of options may be elective or non-elective in nature. Living benefits often are elective, and death benefit options are generally non-elective.
4. Elective contract holder options may be more driven by economic conditions than non-elective options.
5. As the value of a product option increases, there is an increased likelihood that contract holders will behave in a manner that maximizes their financial interest (e.g., lower lapses, higher benefit utilization, etc.).
6. Behavior formulas may have both rational and irrational components (irrational behavior is defined as situations where some contract holders may not always act in their best financial interest). The rational component should be dynamic, but the concept of rationality need not be interpreted in strict financial terms and might change over time in response to observed trends in contract holder behavior based on increased or decreased financial efficiency in exercising their contractual options.
7. Options that are ancillary to the primary product features may not be significant drivers of behavior. Whether an option is ancillary to the primary product features depends on many things, such as:
   a. For what purpose was the product purchased?
   b. Is the option elective or non-elective?
   c. Is the value of the option well-known?
8. External influences may affect behavior.

B. Aggregate vs. Individual Margins

1. Prudent estimate assumptions are developed by applying a margin for uncertainty to the anticipated experience assumption. The issue of whether the level of the margin applied to the anticipated experience assumption is determined in aggregate or independently for each and every behavior assumption is discussed in Principle 3 in Section 1.B.
2. Although this principle discusses the concept of determining the level of margins in aggregate, it notes that the application of this concept shall be guided by evolving practice and expanding knowledge. From a practical standpoint, it may not always be possible to completely apply this concept to determine the level of margins in aggregate for all behavior assumptions.

3. Therefore, the company shall determine prudent estimate assumptions independently for each behavior (e.g., mortality, lapses and benefit utilization), using the requirements and guidance in this section and throughout these requirements, unless the company can demonstrate that an appropriate method was used to determine the level of margin in aggregate for two or more behaviors.

C. Sensitivity Testing

The impact of behavior can vary by product, time period, etc. For any assumption that is not prescribed or stochastically modeled, the qualified actuary to whom responsibility for this group of contracts is assigned shall use sensitivity testing to ensure that the assumption is set at the conservative end of the plausible range. The company shall sensitivity test:

- Surrenders.
- Partial withdrawals.
- Benefit utilization.
- Other behavior assumptions if relevant to the risks in the product.

Sensitivity testing of assumptions is required and shall be more complex than, for example, base lapse assumption plus or minus X% across all contracts. A more appropriate sensitivity test in this example might be to devise parameters in a dynamic lapse formula to reflect more out-of-the-money contracts lapsing and/or more holders of in-the-money contracts persisting and eventually using the guarantee. The company should apply more caution in setting assumptions for behaviors where testing suggests that stochastic modeling results are sensitive to small changes in such assumptions. For such sensitive behaviors, the company shall use higher margins when the underlying experience is less than fully relevant and credible.

The company shall examine the results of sensitivity testing to understand the materiality of prudent estimate assumptions on the modeled reserve. The company shall update the sensitivity tests periodically as appropriate, considering the materiality of the results of the tests. The company may update the tests less frequently when the tests show less sensitivity of the modeled reserve to changes in the assumptions being tested or the experience is not changing rapidly. Providing there is no material impact on the results of the sensitivity testing, the company may perform sensitivity testing:

1. Using samples of the contracts in force rather than performing the entire valuation for each alternative assumption set.

2. Using data from prior periods.

D. Specific Considerations and Requirements

1. Within materiality considerations, the company should consider all relevant forms of contract holder behavior and persistency, including, but not limited to, the following:
a. Mortality (additional guidance and requirements regarding mortality is contained in Section 11).
b. Surrenders.
c. Partial withdrawals (systematic and elective).
d. Account transfers (switching/exchanges).
e. Resets/ratchets of the guaranteed amounts (automatic and elective).
f. Future deposits.
g. Income start date
h. Commutation of benefit (from periodic payment to lump sum)

2. It may be acceptable to ignore certain items that might otherwise be explicitly modeled in an ideal world, particularly if the inclusion of such items reduces the calculated provisions.

For example:

a. The impact of account transfers (intra-contract index “switching”) might be ignored, unless required under the terms of the contract (e.g., automatic asset re-allocation/rebalancing, ) or if the contract provisions incentivize the contract holders to transfer between accounts.
b. Future deposits might be excluded from the model, unless required by the terms of the contracts under consideration and then only in such cases where future premiums can reasonably be anticipated (e.g., with respect to timing and amount).
c. For some non-elective benefits (nursing home benefits for example), a zero incidence rate after the surrender charge has ended, or the cash value has depleted, may be acceptable since use of a non-zero rate could reduce the modeled reserve.

3. However, the company should exercise caution in assuming that current behavior will be indefinitely maintained. For example, it might be appropriate to test the impact of a shifting asset mix and/or consider future deposits to the extent they can reasonably be anticipated and increase the calculated amounts.

4. Normally, the underlying model assumptions would differ according to the attributes of the contract being valued. This would typically mean that contract holder behavior and persistency may be expected to vary according to such characteristics as (this is not an exhaustive list):

a. Gender.
b. Attained age.
c. Issue age.
d. Contract duration.
e. Time to maturity.
f. Tax status.
g. Account value.
h. Interest credited (current and guaranteed).
i. Available indices.
j. Guaranteed benefit amounts.
k. Surrender charges, transfer fees or other contract charges.
l. Distribution channel.

5. Unless there is clear evidence to the contrary, behavior assumptions should be no less conservative than past experience. Margins for contract holder behavior assumptions shall assume, without relevant and credible experience or clear evidence to the contrary, that contract holders’ efficiency will increase over time.

6. In determining contract holder behavior assumptions, the company shall use actual experience data directly applicable to the business segment (i.e., direct data) if it is available. In the absence of direct data, the company should then look to use data from a segment that is similar to the business segment (i.e., other than direct experience), whether or not the segment is directly written by the company. If data from a similar business segment are used, the assumption shall be adjusted to reflect differences between the two segments. Margins shall reflect the data uncertainty associated with using data from a similar but not identical business segment.

7. Where relevant and fully credible empirical data do not exist for a given contract holder behavior assumption, the company shall set the contract holder behavior assumption to reflect the increased uncertainty such that the contract holder behavior assumption is shifted towards the conservative end of the plausible range of expected experience that serves to increase the stochastic reserve. If there are no relevant data, the company shall set the contract holder behavior assumption to reflect the increased uncertainty such that the contract holder behavior assumption is at the conservative end of the range. Such adjustments shall be consistent with the definition of prudent estimate, with the principles described in Section 1.B, and with the guidance and requirements in this section.

8. Ideally, contract holder behavior would be modeled dynamically according to the simulated economic environment and/or other conditions. It is important to note, however, that contract holder behavior should neither assume that all contract holders act with 100% efficiency in a financially rational manner nor assume that contract holders will always act irrationally. These extreme assumptions may be used for modeling efficiency if the result is more conservative.

E. Dynamic Assumptions

1. Consistent with the concept of prudent estimate assumptions described earlier, the liability model should incorporate margins for uncertainty for all risk factors that are not dynamic (i.e., the non-scenario tested assumptions) and are assumed not to vary according to the financial interest of the contract holder.

2. The company should exercise care in using static assumptions when it would be more natural and reasonable to use a dynamic model or other scenario-dependent formulation for behavior. With due regard to considerations of materiality and practicality, the use of
dynamic models is encouraged, but not mandatory. Risk factors that are not scenario tested but could reasonably be expected to vary according to a stochastic process, or future states of the world (especially in response to economic drivers) may require higher margins and/or signal a need for higher margins for certain other assumptions.

3. Risk factors that are modeled dynamically should encompass the plausible range of behavior consistent with the economic scenarios and other variables in the model, including the non-scenario tested assumptions. The company shall test the sensitivity of results to understand the materiality of making alternate assumptions and follow the guidance discussed above on setting assumptions for sensitive behaviors.

F. Consistency with the CTE Level

1. All behaviors (i.e., dynamic, formulaic and non-scenario tested) should be consistent with the scenarios used in the CTE calculations (generally, the top 30% of the loss distribution). To maintain such consistency, it is not necessary to iterate (i.e., successive runs of the model) in order to determine exactly which scenario results are included in the CTE measure. Rather, in light of the products being valued, the company should be mindful of the general characteristics of those scenarios likely to represent the tail of the loss distribution and consequently use prudent estimate assumptions for behavior that are reasonable and appropriate in such scenarios. For fixed annuities, these “valuation” scenarios would typically display one or more of the following attributes:

a. Declining and/or volatile index values, where applicable.
b. Price gaps and/or liquidity constraints.
c. Rapidly changing interest rates or persistently low interest rates.
d. Volatile credit spreads.

2. The behavior assumptions should be logical and consistent both individually and in aggregate, especially in the scenarios that govern the results. In other words, the company should not set behavior assumptions in isolation, but give due consideration to other elements of the model. The interdependence of assumptions (particularly those governing customer behaviors) makes this task difficult and by definition requires professional judgment, but it is important that the model risk factors and assumptions:

a. Remain logically and internally consistent across the scenarios tested.
b. Represent plausible outcomes.
c. Lead to appropriate, but not excessive, asset requirements.

4. The company should remember that the continuum of “plausibility” should not be confined or constrained to the outcomes and events exhibited by historic experience.

5. Companies should attempt to track experience for all assumptions that materially affect their risk profiles by collecting and maintaining the data required to conduct credible and meaningful studies of contract holder behavior.

G. Additional Considerations and Requirements for Assumptions Applicable to Guaranteed Living Benefits
Experience for contracts without guaranteed living benefits may be of limited use in setting a lapse assumption for contracts with in-the-money or at-the-money guaranteed living benefits. Such experience may only be used if it is appropriate (e.g., lapse experience on contracts without a living benefit may have relevance to the early durations of contracts with living benefits) and relevant to the business.

H. Policy Loans

If policy loans are applicable for the block of business, the company shall determine cash flows for each projection interval for policy loan assets by modeling existing loan balances either explicitly or by substituting assets that are a proxy for policy loans (e.g., bonds, cash, etc.) subject to the following:

1. If the company substitutes assets that are a proxy for policy loans, the company must demonstrate that such substitution:
   a. Produces reserves that are no less than those that would be produced by modeling existing loan balances explicitly.
   b. Complies with the contract holder behavior requirements stated in Section 10 above in this section.

2. If the company models policy loans explicitly, the company shall:
   a. Treat policy loan activity as an aspect of contract holder behavior and subject to the requirements above in this section.
   b. Assign loan balances either to exactly match each policy’s utilization or to reflect average utilization over a model segment or sub-segments.
   c. Model policy loan interest in a manner consistent with policy provisions and with the scenario. Include interest paid in cash as a positive policy loan cash flow in that projection interval, but do not include interest added to the loan balance as a policy loan cash flow. (The increased balance will require increased repayment cash flows in future projection intervals.)
   d. Model policy loan principal repayments, including those that occur automatically upon death or surrender. Include policy loan principal repayments as a positive policy loan cash flow, per Section 4.A.1.h.
   e. Model additional policy loan principal. Include additional policy loan principal as a negative policy loan cash flow, per Section 4.A.1.h (but do not include interest added to the loan balance as a negative policy loan cash flow).
   f. Model any investment expenses allocated to policy loans and include them either with policy loan cash flows or insurance expense cash flows.

I. Non-Guaranteed Elements

Consistent with the definition in VM-01, Non-Guaranteed Elements (NGEs) are elements within a contract that affect policy costs or values and not guaranteed or not determined at issue. NGEs consist of elements affecting contract holder costs or values that are both established and subject to change at the discretion of the insurer.
Examples of NGEs specific to fixed annuities include but are not limited to the following: fixed credited rates, index parameters (caps, spreads, participation rates, etc.), rider fees, rider benefit features being subject to change (rollup rates, rollup period, etc.), account value charges, and dividends under participating policies or contracts.

1. Except as noted below in Section 10.J.5, the company shall include NGE in the models to project future cash flows beyond the time the company has authorized their payment or crediting.

2. The projected NGE shall reflect factors that include, but are not limited to, the following (not all of these factors will necessarily be present in all situations):
   a. The nature of contractual guarantees.
   b. The company’s past NGE practices and established NGE policies.
   c. The timing of any change in NGE relative to the date of recognition of a change in experience.
   d. The benefits and risks to the company of continuing to authorize NGE.

3. Projected NGE shall be established based on projected experience consistent with how actual NGE are determined.

4. Projected levels of NGE in the cash-flow model must be consistent with the experience assumptions used in each scenario. Contract holder behavior assumptions in the model must be consistent with the NGE assumed in the model.

5. The company may exclude any portion of an NGE that:
   a. Is not based on some aspect of the policy’s or contract’s experience.
   b. Is authorized by the board of directors and documented in the board minutes, where the documentation includes the amount of the NGE that arises from other sources.

   However, if the board has guaranteed a portion of the NGE into the future, the company must model that amount. In other words, the company cannot exclude from its model any NGE that the board has guaranteed for future years, even if it could have otherwise excluded them, based on this subsection.

6. The liability for contract holder dividends declared but not yet paid that has been established according to statutory accounting principles as of the valuation date is reported separately from the statutory reserve. The contract holder dividends that give rise to this dividend liability as of the valuation date may or may not be included in the cash-flow model at the company’s option.
   a. If the contract holder dividends that give rise to the dividend liability are not included in the cash-flow model, then no adjustment is needed to the resulting aggregate stochastic reserve.
   b. If the contract holder dividends that give rise to the dividend liability are included in the cash-flow model, then the resulting aggregate stochastic reserve should be reduced by the amount of the dividend liability.

7. All projected cash flows associated with NGEs shall reflect margins for adverse deviations and estimation error in prudent estimate assumptions.
Section 11: Guidance and Requirements for Setting Prudent Estimate Mortality Assumptions

A. Overview

1. Intent

The guidance and requirements in this section apply to setting prudent estimate mortality assumptions when determining the stochastic reserve. The intent is for prudent estimate mortality assumptions to be based on facts, circumstances and appropriate actuarial practice, with only a limited role for unsupported actuarial judgment. (Where more than one approach to appropriate actuarial practice exists, the company should select the practice that the company deems most appropriate under the circumstances.)

2. Description

Prudent estimate mortality assumptions shall be determined by first developing expected mortality curves based on either available experience or published tables. Where necessary, margins shall be applied to the experience to reflect data uncertainty. The expected mortality curves shall then be adjusted based on the credibility of the experience used to determine the expected mortality curve. Section 11.B addresses guidance and requirements for determining expected mortality curves, and Section 11.C addresses guidance and requirements for adjusting the expected mortality curves to determine prudent estimate mortality.

Finally, the credibility-adjusted tables shall be adjusted for mortality improvement (where such adjustment is permitted or required) using the guidance and requirements in Section 11.D.

3. Business Segments

For purposes of setting prudent estimate mortality assumptions, the products falling under the scope of these requirements shall be grouped into business segments with different mortality assumptions. The grouping, at a minimum, should differentiate between payout annuities or deferred annuity contracts that contain GLBs, and deferred annuity contracts with no guaranteed benefits or only GMDBs. Where appropriate, the grouping should also differentiate between segments which are known or expected to contain contract holders with sociodemographic, geographic, or health factors reasonably expected to impact the mortality assumptions for the segment (e.g., annuitants drawn from different countries, geographic areas, industry groups, or impaired lives on individually underwritten contracts such as structured settlements). The grouping should also generally follow the pricing, marketing, management and/or reinsurance programs of the company.

Guidance Note: This paragraph contemplates situations where it may be appropriate to differentiate mortality assumptions by segment or even by contract due to varying sociodemographic, geographic, or health factors. Particularly, though not exclusively, in the context of group payout annuity contracts, companies may have credible, contract-specific mortality experience data or relevant pooled data from annuitants drawn from similar industries or geographies that may be used to sub-divide inforce blocks into business segments for purposes of setting prudent estimate mortality assumptions.

For example, a company may sell group PRT contracts both to union plans in the U.S. and to private single-employer plans in another country. While both are “PRT contracts,” it would be appropriate to differentiate them for mortality assumption purposes, similar to...
how payout annuities vs. deferred annuities are distinguished.

**Guidance Note:** Distinct mortality or liability assumptions among different contracts within a group of contracts does not in itself preclude the group of contracts from being aggregated for the purposes of the broader stochastic reserve calculation.

4. Margin for Data Uncertainty

The expected mortality curves that are determined in Section 11.B may need to include a margin for data uncertainty. The margin could be in the form of an increase or a decrease in mortality, depending on the business segment under consideration. The margin shall be applied in a direction (i.e., increase or decrease in mortality) that results in a higher reserve. A sensitivity test may be needed to determine the appropriate direction of the provision for uncertainty to mortality. The test could be a prior year mortality sensitivity analysis of the business segment or an examination of current representative cells of the segment.

For purposes of this section, if mortality must be increased (decreased) to provide for uncertainty, the business segment is referred to as a plus (minus) segment.

It may be necessary, because of a change in the mortality risk profile of the segment, to reclassify a business segment from a plus (minus) segment to a minus (plus) segment to the extent compliance with this section requires such a reclassification. For example, a segment could require reclassification depending on whether it is gross or net of reinsurance.

B. Determination of Expected Mortality Curves

1. Experience Data

In determining expected mortality curves, the company shall use actual experience data directly applicable to the business segment (i.e., direct data) if it is available. In the absence of direct data, the company should then look to use data from a segment that is similar to the business segment (i.e., other than direct experience). See Section 11.B.2. for additional considerations. Finally, if there is no data, the company shall use the applicable table, as required in Section 11.B.3.

2. Data Other Than Direct Experience

Adjustments shall be applied to the data to reflect differences between the business segments, and margins shall be applied to the adjusted expected mortality curves to reflect the data uncertainty associated with using data from a similar but not identical business segment.

To the extent the mortality of a business segment is reinsured, any mortality charges that are consistent with the company’s own pricing and applicable to a substantial portion of the mortality risk also may be a reasonable starting point for the determination of the company’s expected mortality curves.

3. No Data Requirements

i. When little or no experience or information is available on a business segment, the company shall use expected mortality curves that would produce expected deaths no less than:
a. [2021 SOA Deferred Annuity Mortality Table] with [Projection Scale G2] for individual deferred annuities that do not contain guaranteed living benefits

\[ q^*_{x+1} = q^*_{x} (1 - G2_x)^n \]

ii. When little or no experience or information is available on a business segment, the company shall use expected mortality curves that would produce expected deaths no greater than:

a. [The appropriate percentage (\(F_x\)) from Table 11.1 applied to the 2012 IAM Basic Mortality Table] with [Projection Scale G2] for individual payout annuity contracts and deferred annuity contracts with guaranteed living benefits

\[ q^*_{x+1} = q^*_{x} (1 - G2_x)^n \]

b. [1983 Table “a”] for structured settlements or other contracts with impaired mortality

c. [1994 GAR Table] with [Projection Scale AA] for group annuities

\[ q^*_{x+1} = q^*_{x} (1 - AA_x)^n \]

#### 4. Additional Considerations Involving Data

The following considerations shall apply to mortality data specific to the business segment for which assumptions are being determined (i.e., direct data discussed in Section 11.B.1 or other than direct data discussed in Section 11.B.2).

</tbody>
</table>

a. **Underreporting of Deaths**

Mortality data shall be examined for possible underreporting of deaths. Adjustments shall be made to the data if there is any evidence of underreporting. Alternatively, exposure by lives or amounts on contracts for which death benefits were in the money may be used to determine expected mortality curves. Underreporting on such exposures should be minimal; however, this reduced subset of data will have less credibility.

b. **Experience by Contract Duration**

Experience of a plus segment shall be examined to determine if mortality by contract duration increases materially due to selection at issue. In the absence of information, the company shall assume that expected mortality will increase by contract duration for an appropriate select period. As an alternative, if the company determines that mortality is affected by selection, the company could apply margins to the expected mortality in such a way that the actual mortality modeled does not depend on contract duration.

c. **Modification and Relevance of Data**
Even for a large company, the quantity of life exposures and deaths are such that a significant amount of smoothing may be required to determine expected mortality curves from mortality experience. Expected mortality curves, when applied to the recent historic exposures (e.g., three to seven years), should not result in an estimate of aggregate number of deaths less (greater) than the actual number deaths during the exposure period for plus (minus) segments.

In determining expected mortality curves (and the credibility of the underlying data), older data may no longer be relevant. The “age” of the experience data used to determine expected mortality curves should be documented.

d. Other Considerations

In determining expected mortality curves, consideration should be given to factors that include, but are not limited to, trends in mortality experience, trends in exposure, volatility in year-to-year A/E mortality ratios, mortality by lives relative to mortality by amounts, changes in the mix of business and product features that could lead to mortality selection.

C. Adjustment for Credibility to Determine Prudent Estimate Mortality

1. Adjustment for Credibility

The expected mortality curves determined in Section 11.B shall be adjusted based on the credibility of the experience used to determine the curves in order to arrive at prudent estimate mortality. The adjustment for credibility shall result in blending the expected mortality curves with the mortality assumption described in Section 11.B.3. The approach used to adjust the curves shall suitably account for credibility.

Guidance Note: For example, when credibility is zero, an appropriate approach should result in a mortality assumption consistent with 100% of the mortality table used in the blending.

2. Adjustment of Statutory Valuation Mortality for Improvement

For purposes of the adjustment for credibility, the mortality table for a plus segment may be and the mortality table for a minus segment must be adjusted for mortality improvement. Such adjustment shall reflect the mortality improvement scale described in Section 11.B.3 from the effective date of the respective mortality table to the experience weighted average date underlying the data used to develop the expected mortality curves.

3. Credibility Procedure

The credibility procedure used shall:

a. Produce results that are reasonable.

b. Not tend to bias the results in any material way.

c. Be practical to implement.

d. Give consideration to the need to balance responsiveness and stability.

e. Take into account not only the level of aggregate claims but the shape of the mortality curve.
f. Contain criteria for full credibility and partial credibility that have a sound statistical basis and be appropriately applied.

4. Further Adjustment of the Credibility-Adjusted Table for Mortality Improvement

The credibility-adjusted table used for plus segments may be and the credibility adjusted table used for minus segments must be adjusted for mortality improvement using the applicable mortality improvement scale described in Section 11.B.3 from the experience weighted average date underlying the company experience used in the credibility process to the valuation date.

Any adjustment for mortality improvement beyond the valuation date is discussed in Section 11.D.

D. Future Mortality Improvement

The mortality assumption resulting from the requirements of Section 11.C shall be adjusted for mortality improvements beyond the valuation date if such an adjustment would serve to increase the resulting stochastic reserve. If such an adjustment would reduce the stochastic reserve, such assumptions are permitted, but not required. In either case, the assumption must be based on current relevant data with a margin for uncertainty (increasing assumed rates of improvement if that results in a higher reserve or reducing them otherwise).
Section 12: Allocation of Aggregate Reserves to the Contract Level

Section 3.F states that the aggregate reserve shall be allocated to the contracts falling within the scope of these requirements. That allocation should be done for both the pre- and post-reinsurance ceded reserves. Contracts that have passed the stochastic exclusion test as defined in Section 7.B will not be included in the allocation of the aggregate reserve. For the purpose of this section, if a contract does not have a cash surrender value, then the cash surrender value is assumed to be zero.

Contracts for which the Deterministic Certification Option is elected in Section 7.E are intended to use the methodology described in this section to allocate aggregate reserves in excess of the cash surrender value to individual contracts.

The contract-level reserve for each contract shall be the sum of the following:

A. The contract’s cash surrender value.

Drafting Note: The American Academy of Actuaries Annuity Reserves and Capital Work Group is including two potential options for allocating the excess portion of the aggregate reserve over cash surrender value: (1) Use the same approach as VM-21 (2) Allocate based on an actuarial present value calculation.

The Work Group did not reach a consensus between these two approaches, so wording for both is included in the text below. The Work Group recommends field testing both approaches and considering the results in determining future decisions.

Option 1: VM-21 Approach

B. An allocated portion of the excess of the aggregate reserve over the aggregate cash surrender value shall be allocated to each contract based on a measure of the risk of that product relative to its cash surrender value in the context of the company’s in force contracts (assuming zero cash value for contracts that do not contain such). The measure of risk should consider the impact of risk mitigation programs, including hedge programs and reinsurance, that would affect the risk of the product. The specific method of assessing that risk and how it contributes to the company’s aggregate reserve shall be defined by the company. The method should provide for an equitable allocation based on risk analysis.

1. As an example, consider a company with the results of the following three contracts:

Table 12.1: Sample Allocation of Aggregate Reserve

<table>
<thead>
<tr>
<th>Contract (i)</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>Total</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cash Surrender Value, C</td>
<td>28</td>
<td>40</td>
<td>52</td>
<td>120</td>
</tr>
<tr>
<td>Risk adjusted measure, R</td>
<td>38</td>
<td>52</td>
<td>50</td>
<td></td>
</tr>
<tr>
<td>Aggregate Reserve</td>
<td></td>
<td></td>
<td></td>
<td>140</td>
</tr>
<tr>
<td>Allocation Basis for the excess of the Aggregate Reserve over the Cash Surrender Value ( Ai = \text{Max}(Ri-Ci, 0) )</td>
<td>10</td>
<td>12</td>
<td>0</td>
<td>22</td>
</tr>
</tbody>
</table>
2. In this example, the Aggregate Reserve exceeds the aggregate Cash Surrender Value by 20. The 20 is allocated proportionally across the three contracts based on the allocation basis of the larger of (i) zero; and (ii) a risk adjusted measure based on reserve principles. Therefore, contracts 1 and 2 receive 45% (9/22) and 55% (11/22), respectively, of the excess Aggregate Reserve. As Contract 3 presents no risk in excess of its cash surrender value, it does not receive an allocation of the excess Aggregate Reserve.

**Option 2: Actuarial Present Value Approach**

**B.** The excess of the aggregate reserve over the aggregate cash surrender value is allocated to policies based on a calculation of the actuarial present value of projected liability cash flows in excess of the cash surrender value:

1. Discount the liability cash flows at the NAER, pursuant to requirements in Section 4, for the scenario that produces the scenario reserve closest to, but not less than the stochastic reserve defined in Section 3.D.
   a. Groups of contracts that elect the Deterministic Certification Option defined in Section 7.E shall use the NAER in the single scenario used to calculate the reserve to discount liability cash flows.

2. If the actuarial present value is less than the cash surrender value, then the excess actuarial present value to be used for allocating the excess aggregate reserve over the cash value shall be floored at zero.
   a. If all contracts have an excess actuarial present value that is floored at zero, then use the cash surrender value to allocate any excess aggregate reserve over the aggregate cash surrender value.

3. For projecting future liability cash flows, assume the same liability assumptions that were used to calculate the stochastic reserve defined in 3.D.

4. As a hypothetical example, consider a company with the results of the following five contracts:

<table>
<thead>
<tr>

*Cash Surrender Value
**Guaranteed Lifetime Withdrawal Benefit

Guidance Note: The actuarial present value (APV) in the section above is separate from the Guarantee Actuarial Present Value (GAPV) referred to in the additional standard projection amount calculation in VM-21. The GAPV is only applicable to guaranteed minimum benefits and uses prescribed liability assumptions. In contrast, the APV in this section applies to the entire contract, irrespective of whether guaranteed benefits are attached, and uses company prudent estimate liability assumptions.
Section 13: Statutory Maximum Valuation Interest Rates for Income Annuity Formulaic Reserves

A. Purpose and Scope

1. These requirements define for single premium immediate annuity contracts and other similar contracts, certificates and contract features the statutory maximum valuation interest rate that complies with Model #820. These are the maximum interest rate assumption requirements to be used in the CARVM and for certain contracts, the CRVM. These requirements do not preclude the use of a lower valuation interest rate assumption by the company if such assumption produces statutory reserves at least as great as those calculated using the maximum rate defined herein.

2. The following categories of contracts, certificates and contract features, whether group or individual, including both life contingent and term certain only contracts, directly written or assumed through reinsurance, with the exception of benefits arising from variable annuities, are covered in this section:
   a. Immediate annuity contracts issued after Dec. 31, 2017;
   b. Deferred income annuity contracts issued after Dec. 31, 2017;
   c. Structured settlements in payout or deferred status issued after Dec. 31, 2017;
   d. Fixed payout annuities resulting from the exercise of settlement options or annuitizations of host contracts issued after Dec. 31, 2017;
   e. Fixed payout annuities resulting from the exercise of settlement options or annuitizations of host contracts issued during 2017, for fixed payouts commencing after Dec. 31, 2018, or, at the option of the company, for fixed payouts commencing after Dec. 31, 2017;
   f. Supplementary contracts, excluding contracts with no scheduled payments (such as retained asset accounts and settlements at interest), issued after Dec. 31, 2017;
   g. Fixed income payment streams, attributable to contingent deferred annuities (CDAs) issued after Dec. 31, 2017, once the underlying contract funds are exhausted;
   h. Fixed income payment streams attributable to guaranteed living benefits associated with deferred annuity contracts issued after Dec. 31, 2017, once the contract funds are exhausted; and
   i. Certificates with premium determination dates after Dec. 31, 2017, emanating from non-variable group annuity contracts specified in Model #820, Section 5.C.2, purchased for the purpose of providing certificate holders benefits upon their retirement.

   **Guidance Note:** For Section 13.A.2.d, Section 13.A.2.e, Section 13.A.2.f and Section 13.A.2.h above, there is no restriction on the type of contract that may give rise to the benefit.

3. Exemptions:
   a. With the permission of the domiciliary commissioner, for the categories of annuity contracts, certificates and/or contract features in scope as outlined in Section 13.A.2.d, Section 13.A.2.e, Section 13.A.2.f, Section 13.A.2.g or Section 13.A.2.h, the company may use the same maximum valuation interest rate used to value the payment stream in accordance with the guidance applicable to the host contract. In order to obtain such
permission, the company must demonstrate that its investment policy and practices are consistent with this approach.

4. The maximum valuation interest rates for the contracts, certificates and contract features within the scope of Section 13 of VM-22 supersede those described in Appendix VM-A and Appendix VM-C, but they do not otherwise change how those appendices are to be interpreted. In particular, Actuarial Guideline IX-B—Clarification of Methods Under Standard Valuation Law for Individual Single Premium Immediate Annuities, Any Deferred Payments Associated Therewith, Some Deferred Annuities and Structured Settlements Contracts (AG-9-B) (see VM-C) provides guidance on valuation interest rates and is, therefore, superseded by these requirements for contracts, certificates and contract features in scope. Likewise, any valuation interest rate references in Actuarial Guideline IX-C—Use of Substandard Annuity Mortality Tables in Valuing Impaired Lives Under Individual Single Premium Immediate Annuities (AG-9-C) (see VM-C) are also superseded by these requirements.

B. Definitions

1. The term “reference period” means the length of time used in assigning the Valuation Rate Bucket for the purpose of determining the statutory maximum valuation interest rate and is determined as follows:

   a. For contracts, certificates or contract features with life contingencies and substantially similar payments, the reference period is the length of time, rounded to the nearest year, from the premium determination date to the earlier of: i) the date of the last non-life-contingent payment under the contract, certificate or contract feature; and ii) the date of the first life-contingent payment under the contract, certificate or contract feature, or

   b. For contracts, certificates or contract features with no life-contingent payments and substantially similar payments, the reference period is the length of time, rounded to the nearest year, from the premium determination date to the date of the last non-life-contingent payment under the contract, certificate or contract feature, or

   c. For contracts, certificates or contract features where the payments are not substantially similar, the actuary should apply prudent judgment and select the Valuation Rate Bucket with Macaulay duration that is a best fit to the Macaulay duration of the payments in question.

   **Guidance Note:** Contracts with installment refunds or similar features should consider the length of the installment period calculated from the premium determination date as the non-life contingent period for the purpose of determining the reference period.

   **Guidance Note:** The determination in Section 13.B.1.c above shall be made based on the materiality of the payments that are not substantially similar relative to the life-contingent payments.

2. The term “jumbo contract” means a contract with an initial consideration equal to or greater than $250 million. Considerations for contracts issued by an insurer to the same contract holder within 90 days shall be combined for purposes of determining whether the contracts meet this threshold.

   **Guidance Note:** If multiple contracts meet this criterion in aggregate, then each contract is a jumbo contract.

3. The term “non-jumbo contract” means a contract that does not meet the definition of a jumbo
contract.

4. The term “premium determination date” means the date as of which the valuation interest rate for the contract, certificate or contract feature being valued is determined.

5. The term “initial age” means the age of the annuitant as of his or her age last birthday relative to the premium determination date. For joint life contracts, certificates or contract features, the “initial age” means the initial age of the younger annuitant. If a contract, certificate or contract feature for an annuitant is being valued on a standard mortality table as an impaired annuitant, “initial age” means the rated age. If a contract, certificate or contract feature is being valued on a substandard mortality basis, “initial age” means an equivalent rated age.

6. The term “Table X spreads” means the prescribed VM-22 Section 13 current market benchmark spreads for the quarter prior to the premium determination date, as published on the Industry tab of the NAIC website. The process used to determine Table X spreads is the same as that specified in VM-20 Appendix 2.D for Table F, except that JP Morgan and Bank of America bond spreads are averaged over the quarter rather than the last business day of the month.

7. The term “expected default cost” means a vector of annual default costs by weighted average life. This is calculated as a weighted average of the VM-20 Table A prescribed annual default costs published on the Industry tab of the NAIC website in effect for the quarter prior to the premium determination date, using the prescribed portfolio credit quality distribution as weights.

8. The term “expected spread” means a vector of spreads by weighted average life. This is calculated as a weighted average of the Table X spreads, using the prescribed portfolio credit quality distribution as weights.

9. The term “prescribed portfolio credit quality distribution” means the following credit rating distribution:
   a. 5% Treasuries
   b. 15% Aa bonds (5% Aa1, 5% Aa2, 5% Aa3)
   c. 40% A bonds (13.33% A1, 13.33% A2, 13.33% A3)*
   d. 40% Baa bonds (13.33% Baa1, 13.33% Baa2, 13.33% Baa3)*

*40%/3 is used unrounded in the calculations.

C. Determination of the Statutory Maximum Valuation Interest Rate

1. Valuation Rate Buckets
   a. For the purpose of determining the statutory maximum valuation interest rate, the contract, certificate or contract feature being valued must be assigned to one of four Valuation Rate Buckets labeled A through D.
   b. If the contract, certificate or contract feature has no life contingencies, the Valuation Rate Bucket is assigned based on the length of the reference period (RP), as follows:

      Table 3-1: Assignment to Valuation Rate Bucket by Reference Period Only
c. If the contract, certificate or contract feature has life contingencies, the Valuation Rate Bucket is assigned based on the length of the RP and the initial age of the annuitant, as follows:

Table 3-2: Assignment to Valuation Rate Bucket by Reference Period and Initial Age

<table>
<thead>
<tr>
<th>Initial Age</th>
<th>RP ≤ 5Y</th>
<th>5Y &lt; RP ≤ 10Y</th>
<th>10Y &lt; RP ≤ 15Y</th>
<th>RP &gt; 15Y</th>
</tr>
</thead>
<tbody>
<tr>
<td>90+</td>

2. Premium Determination Dates

a. The following table specifies the decision rules for setting the premium determination date for each of the contracts, certificates and contract features listed in Section 1:

Table 3-3: Premium Determination Dates

<table>
<thead>
<tr>
<th>Section</th>
<th>Item Description</th>
<th>Premium determination date</th>
</tr>
</thead>
<tbody>
<tr>
<td>A.2.a</td>
<td>Immediate annuity</td>
<td>Date consideration is determined and committed to by contract holder</td>
</tr>
<tr>
<td>A.2.b</td>
<td>Deferred income annuity</td>
<td>Date consideration is determined and committed to by contract holder</td>
</tr>
<tr>
<td>A.2.c</td>
<td>Structured settlements</td>
<td>Date consideration is determined and committed to by contract holder</td>
</tr>
<tr>
<td>A.2.d and A.2.e</td>
<td>Fixed payout annuities resulting from settlement options or annuitizations from host contracts</td>
<td>Date consideration for benefit is determined and committed to by contract holder</td>
</tr>
<tr>
<td>A.2.f</td>
<td>Supplementary contracts</td>
<td>Date of issue of supplementary contract</td>
</tr>
<tr>
<td>A.2.g</td>
<td>Fixed income payment streams from CDAs, AV becomes 0</td>
<td>Date on which AV becomes 0</td>
</tr>
<tr>
<td>A.2.h</td>
<td>Fixed income payment streams from guaranteed living benefits, AV becomes 0</td>
<td>Date on which AV becomes 0</td>
</tr>
</tbody>
</table>
Guidance Note: For the purposes of the items in the table above, the phrase “date consideration is determined and committed to by the contract holder” should be interpreted by the company in a manner that is consistent with its standard practices. For some products, that interpretation may be the issue date or the date the premium is paid.

b. Immaterial Change in Consideration

If the premium determination date is based on the consideration, and if the consideration changes by an immaterial amount (defined as a change in present value of less than 10% and less than $1 million) subsequent to the original premium determination date, such as due to a data correction, then the original premium determination date shall be retained. In the case of a group annuity contract where a single premium is intended to cover multiple certificates, certificates added to the contract after the premium determination date that do not trigger the company’s right to reprice the contract shall be treated as if they were included in the contract as of the premium determination date.

3. Statutory Maximum Valuation Interest Rate

a. For a given contract, certificate or contract feature, the statutory maximum valuation interest rate is determined based on its assigned Valuation Rate Bucket (Section 13.C.1) and its Premium Determination Date (Section 13.C.2) and whether the contract associated with it is a jumbo contract or a non-jumbo contract.

b. Statutory maximum valuation interest rates for jumbo contracts are determined and published daily by the NAIC on the Industry tab of the NAIC website. For a given premium determination date, the statutory maximum valuation interest rate is the daily statutory maximum valuation interest rate published for that premium determination date.

c. Statutory maximum valuation interest rates for non-jumbo contracts are determined and published quarterly by the NAIC on the Industry tab of the NAIC website by the third business day of the quarter. For a given premium determination date, the statutory maximum valuation interest rate is the quarterly statutory maximum valuation interest rate published for the quarter in which the premium determination date falls.

d. Quarterly Valuation Rate:

For each Valuation Rate Bucket, the quarterly valuation rate is defined as follows:

\[ I_q = R + S - D - E \]

Where:

a. R is the reference rate for that Valuation Rate Bucket (defined in Section 13.C.4);

b. S is the spread rate for that Valuation Rate Bucket (defined in Section 13.C.5);

c. D is the default cost rate for that Valuation Rate Bucket (defined in Section 13.C.6);
and

d. E is the spread deduction defined as 0.25%.

e. Daily Valuation Rate:

For each Valuation Rate Bucket, the daily valuation rate is defined as follows:

\[ I_d = I_q + C_{d-1} - C_q \]

Where:

a. \( I_q \) is the quarterly valuation rate for the calendar quarter preceding the business day immediately preceding the premium determination date;

b. \( C_{d-1} \) is the daily corporate rate (defined in Section 13.C.7) for the business day immediately preceding the premium determination date; and

c. \( C_q \) is the average daily corporate rate (defined in Section 13.C.8) corresponding to the same period used to develop \( I_q \).

For jumbo contracts, the daily statutory maximum valuation interest rate is the daily valuation rate \( (I_d) \) rounded to the nearest one-hundredth of one percent (1/100 of 1%).

4. Reference Rate

Reference rates are updated quarterly as described below:

a. The “quarterly Treasury rate” is the average of the daily Treasury rates for a given maturity over the calendar quarter prior to the premium determination date. The quarterly Treasury rate is downloaded from https://fred.stlouisfed.org, and is rounded to two decimal places.

b. Download the quarterly Treasury rates for two-year, five-year, 10-year and 30-year U.S. Treasuries.

c. The reference rate for each Valuation Rate Bucket is calculated as the weighted average of the quarterly Treasury rates using Table 1 weights (defined in Section 13.C.9) effective for the calendar year in which the premium determination date falls.

5. Spread

The spreads for each Valuation Rate Bucket are updated quarterly as described below:

a. Use the Table X spreads from the NAIC website for WALs two, five, 10 and 30 years only to calculate the expected spread.

b. Calculate the spread for each Valuation Rate Bucket, which is a weighted average of the expected spreads for WALs two, five, 10 and 30 using Table 2 weights (defined in Section 3.1) effective for the calendar year in which the premium determination date falls.

6. Default costs for each Valuation Rate Bucket are updated annually as described below:

a. Use the VM-20 prescribed annual default cost table (Table A) in effect for the quarter prior to the premium determination date for WAL two, WAL five and WAL 10 years only to calculate the expected default cost. Table A is updated and published annually on
b. Calculate the default cost for each Valuation Rate Bucket, which is a weighted average of the expected default costs for WAL two, WAL five and WAL 10, using Table 3 weights (defined in Section 13.C.9) effective for the calendar year in which the premium determination date falls.

7. Daily Corporate Rate

Daily corporate rates for each valuation rate bucket are updated daily as described below:

a. Each day, download the Bank of America Merrill Lynch U.S. corporate effective yields as of the previous business day’s close for each index series shown in the sample below from the St. Louis Federal Reserve website: https://research.stlouisfed.org/fred2/categories/32348. To access a specific series, search the St. Louis Federal Reserve website for the series name by inputting the name into the search box in the upper right corner, or input the following web address: https://research.stlouisfed.org/fred2/series/[replace with series name from the table below].

<table>
<thead>
<tr>
<th>Maturity</th>
<th>Series Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>1Y – 3Y</td>
<td>BAMLC1A0C13YEY</td>
</tr>
<tr>
<td>3Y – 5Y</td>
<td>BAMLC2A0C35YEY</td>
</tr>
<tr>
<td>5Y – 7Y</td>
<td>BAMLC3A0C57YEY</td>
</tr>
<tr>
<td>7Y – 10Y</td>
<td>BAMLC4A0C710YEY</td>
</tr>
<tr>
<td>10Y – 15Y</td>
<td>BAMLC7A0C1015YEY</td>
</tr>
<tr>
<td>15Y+</td>
<td>BAMLC8A0C15PYEY</td>
</tr>
</tbody>
</table>

b. Calculate the daily corporate rate for each valuation rate bucket, which is a weighted average of the Bank of America Merrill Lynch U.S. corporate effective yields, using Table 4 weights (defined in Section 13.C.9) effective for the calendar year in which the business date immediately preceding the premium determination date falls.

8. Average Daily Corporate Rate

Average daily corporate rates are updated quarterly as described below:

a. Download the quarterly average Bank of America Merrill Lynch U.S. corporate effective yields for each index series shown in Section 3.G.1 from the St. Louis Federal Reserve website: https://research.stlouisfed.org/fred2/categories/32348. To access a specific series, search the St. Louis Federal Reserve website for the series name by inputting the name into the search box in the upper right corner, or input the following web address: https://research.stlouisfed.org/fred2/series/[replace with series name from Section 13.C.7.a].
b. Calculate the average daily corporate rate for each valuation rate bucket, which is a weighted average of the quarterly average Bank of America Merrill Lynch U.S. corporate effective yields, using Table 4 weights (defined in Section 13.C.9) for the same calendar year as the weight tables (i.e. Tables 1, 2, and 3) used in calculating \( I_q \) in Section 13.C.3.e.

9. Weight Tables 1 through 4

The system for calculating the statutory maximum valuation interest rates relies on a set of four tables of weights that are based on duration and asset/liability cash-flow matching analysis for representative annuities within each valuation rate bucket. A given set of weight tables is applicable to the calculations for every day of the calendar year.

In the fourth quarter of each calendar year, the weights used within each valuation rate bucket for determining the applicable valuation interest rates for the following calendar year will be updated using the process described below. In each of the four tables of weights, the weights in a given row (valuation rate bucket) must add to exactly 100%.

Weight Table 1

The process for determining Table 1 weights is described below:

a. Each valuation rate bucket has a set of representative annuity forms. These annuity forms are as follows:

i. Bucket A:
   a) Single Life Annuity age 91 with 0 and five-year certain periods.
   b) Five-year certain only.

ii. Bucket B:
   a) Single Life Annuity age 80 and 85 with 0, five-year and 10-year certain periods.
   b) 10-year certain only.

iii. Bucket C:
   a) Single Life Annuity age 70 with 0 and 15-year certain periods.
   b) Single Life Annuity age 75 with 0, 10-year and 15-year certain periods.
   c) 15-year certain only.

iv. Bucket D:
   a) Single Life Annuity age 55, 60 and 65 with 0 and 15-year certain periods.
   b) 25-year certain only.

b. Annual cash flows are projected assuming annuity payments are made at the end of each year. These cash flows are averaged for each valuation rate bucket across the annuity forms for that bucket using the statutory valuation mortality table in effect for the following calendar year for individual annuities for males (ANB).
c. The average daily rates in the third quarter for the two-year, five-year, 10-year and 30-year U.S. Treasuries are downloaded from https://fred.stlouisfed.org as input to calculate the present values in Step d.

d. The average cash flows are summed into four time period groups: years 1–3, years 4–7, years 8–15 and years 16–30. (Note: The present value of cash flows beyond year 30 are discounted to the end of year 30 and included in the years 16–30 group. This present value is based on the lower of 3% and the 30-year Treasury rate input in Step c.)

e. The present value of each summed cash-flow group in Step d is then calculated by using the Step 3 U.S. Treasury rates for the midpoint of that group (and using the linearly interpolated U.S. Treasury rate when necessary).

f. The duration-weighted present value of the cash flows is determined by multiplying the present value of the cash-flow groups by the midpoint of the time period for each applicable group.

g. Weightings for each cash-flow time period group within a valuation rate bucket are calculated by dividing the duration weighted present value of the cash flow by the sum of the duration weighted present value of cash flow for each valuation rate bucket.

Weight Tables 2 through 4

Weight Tables 2 through 4 are determined using the following process:

i. Table 2 is identical to Table 1.

ii. Table 3 is based on the same set of underlying weights as Table 1, but the 10-year and 30-year columns are combined since VM-20 default rates are only published for maturities of up to 10 years.

iii. Table 4 is derived from Table 1 as follows:

   a) Column 1 of Table 4 is identical to column 1 of Table 1.
   b) Column 2 of Table 4 is 50% of column 2 of Table 1.
   c) Column 3 of Table 4 is identical to column 2 of Table 4.
   d) Column 4 of Table 4 is 50% of column 3 of Table 1.
   e) Column 5 of Table 4 is identical to column 4 of Table 4.
   f) Column 6 of Table 4 is identical to column 4 of Table 1.

10. Group Annuity Contracts

For a group annuity purchased under a retirement or deferred compensation plan (Section 13.A.2.i), the following apply:

a. The statutory maximum valuation interest rate shall be determined separately for each certificate, considering its premium determination date, the certificate holder’s initial age, the reference period corresponding to its form of payout and whether the contract is a jumbo contract or a non-jumbo contract.

Guidance Note: Under some group annuity contracts, certificates may be purchased on different dates.
b. In the case of a certificate whose form of payout has not been elected by the beneficiary at its premium determination date, the statutory maximum valuation interest rate shall be based on the reference period corresponding to the normal form of payout as defined in the contract or as is evidenced by the underlying pension plan documents or census file. If the normal form of payout cannot be determined, the maximum valuation interest rate shall be based on the reference period corresponding to the annuity form available to the certificate holder that produces the most conservative rate.

Guidance Note: The statutory maximum valuation interest rate will not change when the form of payout is elected.
Valuation Manual Section II. Reserve Requirements

Subsection 2: Annuity Products

A. This subsection establishes reserve requirements for all contracts classified as annuity contracts as defined in SSAP No. 50 in the AP&P Manual.

B. Minimum reserve requirements for variable annuity (VA) contracts and similar business, specified in VM-21, Requirements for Principle-Based Reserves for Variable Annuities, shall be those provided by VM-21. The minimum reserve requirements of VM-21 are considered PBR requirements for purposes of the Valuation Manual.

C. Minimum reserve requirements for fixed annuity contracts issued prior to 1/1/2024 are those requirements as found in VM-A and VM-C as applicable, with the exception of the minimum requirements for the valuation interest rate for single premium immediate annuity contracts, and other similar contracts, issued after Dec. 31, 2017, including those fixed payout annuities emanating from host contracts issued on or after Jan. 1, 2017, and on or before Dec. 31, 2017. The maximum valuation interest rate requirements for those contracts and fixed payout annuities are defined in Section 13 of VM-22, Statutory Maximum Valuation Interest Rates for Income Annuity Formulaic Reserves.

D. Minimum reserve requirements for fixed annuity contracts issued on 1/1/2024 and later are those requirements as found in Sections 1 through 12 of VM-22.

E. The below principles may serve as key considerations for assessing whether VM-21 or VM-22 requirements apply:

1. Index-linked or modified guaranteed annuity contracts or riders that satisfy both of the following conditions may be a key consideration for application of VM-22 requirements:
   a. Guarantees the principal amount of purchase payments, net of any partial withdrawals, and interest credited thereto, less any deduction (without regard to its timing) for sales, administrative or other expenses or charges.
   b. Credits a rate of interest under the contract that is at least equal to the minimum rate required to be credited by the standard nonforfeiture law in the jurisdiction in which the contract is issued.

   **Guidance Note:** Paragraph E.1.b is intended to apply prior to the application of any market value adjustments for modified guaranteed annuities where the underlying assets are held in a separate account. If meeting Paragraph E.1.b prior to the application of any market value adjustments and Paragraph E.1.a above, it may be appropriate to value such contracts under VM-22 requirements.

2. Index-linked or modified guaranteed annuity contracts that do not satisfy either of the two conditions listed above in Paragraph E.1.i and E.1.ii may be a key consideration for application of VM-21 requirements.
Subsection 6: Riders and Supplemental Benefits

**Guidance Note:** Policies or contracts with riders and supplemental benefits which are created to simply disguise benefits subject to the Valuation Manual section describing the reserve methodology for the base product to which they are attached, or exploit a perceived loophole, must be reserved in a manner similar to more typical designs with similar riders.

A. If a rider or supplemental benefit is attached to a health insurance product, deposit-type contract, or credit life or disability product, it may be valued with the base contract unless it is required to be separated by regulation or other requirements.

B. For supplemental benefits on life insurance policies or annuity contracts, including Guaranteed Insurability, Accidental Death or Disability Benefits, Convertibility, Nursing Home Benefits or Disability Waiver of Premium Benefits, the supplemental benefit may be valued with the base policy or contract and follow the reserve requirements for the base policy or contract under VM-20, VM-21, VM-22, VM-A, and/or VM-C, as applicable.

C. ULSG and other secondary guarantee riders on a life insurance policy shall be valued with the base policy and follow the reserve requirements for ULSG policies under VM-20, VM-A and/or VM-C, as applicable.

D. Any guaranteed minimum benefits on life insurance policies or annuity contracts not subject to Paragraph C above including, but not limited to, Guaranteed Minimum Accumulation Benefits, Guaranteed Minimum Death Benefits, Guaranteed Minimum Income Benefits, Guaranteed Minimum Withdrawal Benefits, Guaranteed Lifetime Income Benefits, Guaranteed Lifetime Withdrawal Benefits, Guaranteed Payout Annuity Floors, Waiver of Surrender Charges, Return of Premium, Systematic Withdrawal Benefits under Required Minimum Distributions, and all similar guaranteed benefits shall be valued with the base policy or contract and follow the reserve requirements for the base policy or contract under VM-20, VM-21, VM-22, and VM-A and/or VM-C, as applicable.

E. If a rider or supplemental benefit to a life insurance policy or annuity contract that is not addressed in Paragraphs B, C, or D above possesses any of the following attributes, the rider or supplemental benefit shall be valued with the base policy or contract and follow the reserve requirements for the base policy or contract under VM-20, VM-21, VM-22, and VM-A and/or VM-C, as applicable.

   1. The rider or supplemental benefit does not have a separately identified premium or charge.
   2. After issuance, the rider or supplemental benefit premium, charge, value or benefits are determined by referencing the base policy or contract features or performance.
   3. After issuance, the base policy or contract value or benefits are determined by referencing the rider or supplemental benefit features or performance. The deduction of rider or benefit premium or charge from the contract value is not sufficient for a determination by reference.

F. If a term life insurance rider on the named insured[s] on the base life insurance policy does not meet the conditions of Paragraph E above, and either (1) guarantees level or near level premiums until a specified duration followed by a material premium increase; or (2) for a rider for which level or near level premiums are expected for a period followed by a material premium increase, the rider is separated from the base policy and follows the reserve requirements for term policies under VM20, VM-A and/or VM-C, as applicable.
G. For all other riders or supplemental benefits on life insurance policies or annuity contracts not addressed in Paragraphs B through F above, the riders or supplemental benefits may be valued with the base policy or contract and follow the reserve requirements for the base policy or contract under VM-20, VM-21, VM-22, VM-A and/or VM-C, as applicable. For a given rider, the election to include riders or supplemental benefits with the base policy or contract shall be determined at the policy form level, not on a policy-by-policy basis, and shall be treated consistently from year-to-year, unless otherwise approved by the domiciliary commissioner.

H. Any supplemental benefits and riders offered on life insurance policies or annuity contracts that would have a material impact on the reserve if elected later in the contract life, such as joint income benefits, nursing home benefits, or withdrawal provisions on annuity contracts, shall be considered when determining reserves using the following principles:

1. Policyholders with living benefits and annuitization in the same contract will generally use the more valuable of the two benefits.

2. When advantageous, policyholders will commence living benefit payouts if not started yet.
VM-22 Exposure Priorities

- Standard Projection Amount language analogous to that in VM-21 is expected to be added to the next exposure, as either a disclosure item or floor.

- Comments on the current draft are especially welcome with respect to:
  - Reserve Categories (Section 3):
    - Are more or less categories preferable? If more, how should they be determined?
    - Are more changes required other than in Section 3?
    - Definition language including:
      - Is #8 in “Payout Annuity Reserve Category Definition -VM22 list July 21 2021.docx” too broad or narrow?
      - In “Reserve Category Definitions – Principle Based July 21 2021.docx” is valuation date or issue date preferable?
  - Model Segments (Section 3.E)
    - Conceptual
    - Language
  - Allocation (Section 12)
    - Preference between Option 1 (VM-21 Approach) and Option 2 (Actuarial Present Value Approach)
  - VM-21 vs. VM-22 Distinction (VM Section II edits)
    - Wording for conditions regarding whether to treat index-linked and modified guaranteed annuities as VM-21 or VM-22
  - Exclusion Test
    - Deterministic Certification Option (Section 7.E)
    - Keeping longevity shocks as part of the stochastic exclusion test (current wording) or make a separate test from interest rate/equity shocks in the stochastic exclusion test (alternative)
RESERVING CATEGORY DEFINITIONS

OPTION 1:

The Term "Payout Annuity Reserving Category" includes the following categories of contracts, certificates and contract features, whether group or individual, including both life contingent and term certain only contracts, directly written or assumed through reinsurance, with the exception of benefits provided by variable annuities:

1. Immediate annuity contracts;
2. Deferred income annuity contracts;
3. Structured settlements in payout or deferred status;
4. Fixed income payment streams resulting from the exercise of settlement options or annuitizations of host contracts issued;
5. Supplementary contracts, excluding contracts with no scheduled payments (such as retained asset accounts and settlements at interest);
6. Fixed income payment streams attributable to guaranteed living benefits associated with deferred annuity contracts when the contract funds are exhausted; and
7. Certificates emanating from non-variable group annuity contracts specified in Model #820, Section 5.C.2, purchased for the purpose of providing certificate holders fixed income payment streams upon their retirement.

8. Pension Risk Transfer Annuities.
Reserve Category Definitions

The Accumulation Reserve Category contains contracts with supporting assets such that there is greater disintermediation risk and other risks associated with policyholder behavior, than reinvestment and longevity risks as of the valuation date.

The Payout Reserve Category contains contracts with supporting assets such that there is greater reinvestment and longevity risks, than disintermediation risk and other risks associated with policyholder behavior as of the valuation date.

Guidance Note

Reasonable grouping of contracts is allowed. The determination process shall not incorporate the effect on reserves of categorization decisions and shall be documented in the VM-31 Actuarial Report.
The VM-22 (A) Subgroup of the Life Actuarial (A) Task Force met July 7, 2021. The following Subgroup members participated: Bruce Sartain, Chair, and Vincent Tsang (IL); Ted Chang, Ahmad Kamil, Elaine Lam, and Thomas Reedy (CA); Lei Rao-Knight (CT); Mike Yanacheak (IA); Nicole Boyd (KS); William Leung (MO); Rhonda Ahrens (NE); Seong-min Eom (NJ); Bill Carmello and Amanda Fenwick (NY); Rachel Hemphill and Karen Jiang (TX); Tomasz Serbinowski (UT); and Craig Chupp (VA). Also participating was: John Robinson (MN).

1. Discussed Reserving Categories

Mr. Sartain said the Subgroup has agreed to consider the existing VM-22, Statutory Maximum Valuation Interest Rate for Income Annuities, product descriptions as an alternative to the prescriptive option proposed previously. He said the Subgroup also agreed to consider exploring modifications to the principle-based option for defining reserving categories. He said the Subgroup should determine which approach is preferred or if both approaches should be exposed for public comment.

Mr. Leung discussed the proposed modifications (Attachment One) to the VM-22 product descriptions. He recommended replacing the term “benefits provided by variable annuities” with the term “payment streams arising from variable annuities.” He said the former term would cause supplementary contract payments arising from variable annuity contracts to automatically fall out of the payout reserving category; therefore, he recommended using the latter term. He said the effective date of the VM-22 revisions will make the current references to Dec. 31, 2017, in the descriptions unnecessary. He recommended that fixed income payments from contingent deferred annuities (CDAs) should be treated as variable annuities and should not be included in the scope of VM-22. He noted that pension risk transfer (PRT) business is added. Brian Bayerle (American Council of Life Insurers—ACLI) asked what considerations led to the decision to add PRT business, given that the reserve would also have to be included for active lives. Mr. Leung responded that fixed payment streams from PRT contracts are included only after the payment is determined. Mr. Bayerle said that would require bifurcation of the PRT contract into lives in payout and active lives. Mr. Sartain said that would require bifurcation of the PRT contract into lives in payout and active lives. Mr. Sartain said perhaps a principle-based approach could be used to bifurcate the risks. Mr. Robinson said the Subgroup discussed a similar issue related to payouts under non-variable group annuity contracts. He suggested that the use of the broad reference to “other fixed payment streams such as those under PRT business” might lead to confusion because the term is ambiguous and is not defined in the Valuation Manual. Mr. Sartain suggested removing the ambiguity by removing the reference to anything other than PRT business and providing a definition of PRT business in the Valuation Manual. Ms. Eom suggested that the modification should avoid using the term “fixed payment streams.” She agreed to think about alternative wording.

Mr. Sartain said the principle-based option for reserving categories (Attachment Two) was also modified. He said the concept of supporting assets was brought into the definition to coincide with the reference to disintermediation risk. He said the definition of the payout reserving category was enhanced by adding a reference to longevity risk. He said the accumulation reserving category was improved by adding the risks associated with policyholder behavior. He said the risk category is to be determined based on the risks identified at the time of issue. He noted that the risk category determination under the principle-based approach must be made without consideration of its impact on the reserve amount. Mr. Bayerle said determining at the valuation date lends itself to the possibility of drifting away from the intent over time. Mr. Serbinowski asked if the approach would require that the determination be static after being made at the time of issue. Mr. Sartain said it is intended to be static. Mr. Serbinowski said making the determination on the valuation date would seem to allow the most flexibility to adapt to changing circumstances.

Mr. Sartain said modifications will be made to both approaches for consideration on the next call. He said the modifications will include changing form issue date back to valuation date. He said the goal is to expose the documents and the American Academy of Actuaries’ (Academy’s) revised fixed annuity framework at the July 21 Subgroup meeting. Ms. Hemphill said the Life Actuarial (A) Task Force has adopted a revision to VM-21, Requirements for Principle-Based Reserves for Variable Annuities, that addresses materiality, approximations, and simplifications. She said similar wording should be incorporated into the VM-22 draft for consistency. Chris Conrad (Academy) agreed to consider the change.

Having no further business, the VM-22 (A) Subgroup adjourned.
VM-22:

The Term “Payout Annuity Reserve Category” includes the following categories of contracts, certificates and contract features, whether group or individual, including both life contingent and term certain only contracts, directly written or assumed through reinsurance, with the exception of benefits provided by variable annuities:

1. Immediate annuity contracts issued after Dec. 31, 2017;

2. Deferred income annuity contracts issued after Dec. 31, 2017;

3. Structured settlements in payout or deferred status issued after Dec. 31, 2017;

4. Fixed payout annuities resulting from the exercise of settlement options or annuitizations of host contracts issued after Dec. 31, 2017;

5. Fixed payout annuities resulting from the exercise of settlement options or annuitizations of host contracts issued during 2017, for fixed payouts commencing after Dec. 31, 2018, or, at the option of the company, for fixed payouts commencing after Dec. 31, 2017;

6.5. Supplementary contracts, excluding contracts with no scheduled payments (such as retained asset accounts and settlements at interest), issued after Dec. 31, 2017;

7. Fixed income payment streams attributable to contingent deferred annuities (CDAs) issued after Dec. 31, 2017, once the underlying contract funds are exhausted;

8.6. Fixed income payment streams attributable to guaranteed living benefits associated with deferred annuity contracts issued after Dec. 31, 2017, once the contract funds are exhausted; and

7. Certificates with premium determination dates after Dec. 31, 2017, emanating from non-variable group annuity contracts specified in Model #820, Section 5.C.2, purchased for the purpose of providing certificate holders benefits upon their retirement.

9.8. Other fixed payment streams such as those under Pension Risk Transfer business.

Guidance Note: For Section 1.B.4, Section 1.B.5, Section 1.B.6 and Section 1.B.8 above, there is no restrictions on the type of contract that may give rise to the benefit.
Reserve Category Definitions
The Accumulation Reserve Category contains contracts with supporting assets such that there is greater disintermediation risk and other risks associated with policyholder behavior, than reinvestment and longevity risks at issue.

The Payout Reserve Category contains contracts with supporting assets such that there is greater reinvestment and longevity risks than disintermediation risk and other risks associated with policyholder behavior at issue.

Guidance Note
Reasonable grouping of contracts is allowed. The determination process shall not incorporate the effect on reserves of categorization decisions and shall be documented in the VM-31 Actuarial Report.

Pros of making determination at issue
- Much simpler/easier.
- No reserve discontinuity due to a contract changing categories over time.

Con of making determination at issue date
- Dilutes goal of not allowing for diversification of disintermediation/policyholder risks and reinvestment/longevity risks (e.g. an annuitization of a deferred annuity with no commutation options will be in the Accumulation RC)

Note
If a different reserve methodology is developed for a portion of contracts in the Payout Reserve Category, these definitions may be revisited.
The VM-22 (A) Subgroup of the Life Actuarial (A) Task Force met June 30, 2021. The following Subgroup members participated: Bruce Sartain, Chair, and Vincent Tsang (IL); Ted Chang, Ahmad Kamil, Elaine Lam, and Thomas Reedy (CA); Lei Rao-Knight (CT); Nicole Boyd (KS); William Leung (MO); Seong-min Eom (NJ); Bill Carmello and Amanda Fenwick (NY); Rachel Hemphill and Karen Jiang (TX); and Craig Chupp (VA).

1. **Discussed VM-20 Section 5.A Language**

Mr. Sartain said in a previous discussion of Section 5.A of VM-20, Requirements for Principle-Based Reserves for Life Products, Subgroup members shared views that ranged from desiring more than two reserve categories to desiring a single reserve category. He said the Subgroup ultimately voted to have two reserve categories. He suggested proceeding with the development of an exposure that proceeds with the implementation of two reserve categories.

2. **Heard a PRT Drafting Group Update**

Ms. Eom said the Pension Risk Transfer (PRT) Drafting Group was formed to review the appropriateness of the mortality tables currently used for PRT mortality. She said the table used most often is the 1994 Group Annuity Reserving (GAR) table. She said PRT mortality experience differs from the mortality experience generally observed in annuity populations. She noted that some PRT contracts cover populations outside of the U.S. She said the drafting group held regulator-only sessions to discuss marketing and contract information requested from companies in the PRT market. She said the drafting group hopes to recommend an approach that will serve as a guideline during the development of VM-22, Statutory Maximum Valuation Interest Rate for Income Annuities, and it will provide a good linkage to the VM-22 standard projection amount. She said the drafting group is continuing to receive and analyze company data.

3. **Discussed the VM-22 Field Test**

Mr. Sartain said the American Academy of Actuaries (Academy) is spearheading the planning for a VM-22 field test. He said the timing of the field test is contingent upon the timing of the Life Actuarial (A) Task Force economic scenario generator (ESG) field test. Chris Conrad (Academy) discussed the details of the draft of the fixed annuity principle-based reserving (PBR) field test specifications (Attachment Nineteen-A). He said the company participation portion of the field test is scheduled for May through September of 2022. Pat Allison (NAIC) said the NAIC will participate in the selection of a consultant to lead the field test and will pay a portion of the consulting costs. She said the NAIC will work with state insurance regulators to encourage company participation in the field test and will monitor company involvement. She said the NAIC will also review the consolidation of field test results and assist with the presentation of those results. Mr. Conrad said the structure of the VM-22 field test will be like the yearly renewable term (YRT) field test. He said both payout and deferred annuities will be included in the field test.

Having no further business, the VM-22 (A) Subgroup adjourned.

This Document is Not Final and Will Continue to be a Work in Progress

Annuity Reserves and Capital Work Group Reserves & Capital Field Testing
Description & Specifications

Primary Contacts:
Khloe Greenwood (greenwood@actuary.org)
Steve Jackson (sjackson@actuary.org)

Section I: Field Study Overview

Objectives
1) Measure the impact on actual business of the proposed reserve and capital frameworks relative to the current standards to ensure frameworks are working as intended.
   o Conduct field test to inform decisions related to the proposed fixed annuity principle-based reserving (PBR) methodology
     ▪ Test exclusion testing, allocation, proposed treatment for hedging indexed credit, aggregation, and other methodology elements
2) At a high-level, ensure pillars of framework are met:
   o Appropriate Reflection of Risk—All else equal, greater risk in adverse conditions requires greater statutory reserves/capital, and vice-versa.
   o Comprehensive—The statutory reserve accounts for all material risks covered in the Valuation Manual and inherent in product features and potential management actions associated with the policies or contracts being valued.
   o Consistency Across Products—Statutory reserves between two contracts with similar features and risks are consistent given the same anticipated experience, regardless of product type.
   o Practicality and Appropriateness—Balance principles above with an approach that is practical, auditable, and able to be implemented.

Tentative Timeline: May-September 2022

Structure
• Propose exploring a coordinated effort between Academy, NAIC, and American Council of Life Insurers
• Propose to hire an external consultant who can:
  o Provide companies, collectively and individually, with information on calculations requested
  o Help design field test and communicate with companies
  o Work with Academy Research staff to help aggregate and summarize results
  o Potentially supplement the analysis of the field test results with analysis of factors affecting certain calculations, and/or assessing separate impacts on elements that are less feasible for companies to test

Products Covered (companies can chose which of their products to field test)
• Deferred Annuities
  o Fixed Indexed Annuities (FIAs) with Guaranteed Living Benefits (GLBs)
  o FIAs without GLBs
  o Fixed Deferred Annuities (FDAs) with GLBs (if at least five participating companies to ensure anonymity)
  o FDAs without GLBs (if at least five participating companies to ensure anonymity)

• Payout Annuities
  o Single Premium Immediate Annuities (SPIAs)
  o Pension Risk Transfer (PRT)
  o Deferred Income Annuities (DIAs) (if at least five participating companies to ensure anonymity)

February 8, 2021: Please do not share, distribute or cite this draft document.
This Document is Not Final and Will Continue to be a Work in Progress

- Structured Settlement Contracts (SSCs) (if at least five participating companies to ensure anonymity)

- Potential Survey Questions
  - Does your company have “longevity reinsurance,” and is it more closely related to mortality-linked securities or an explicit reinsurance contract for annuities?
  - Does your company have modified guaranteed annuities? If so, would you value them as variable or fixed annuities?

- Population
  - For time = 0, test at least 10 years of inforce non-variable annuity products in scope
    - Participants must provide output by policy duration or issue year to provide a sense of the durational impact
    - At option of the participant, may test for using all past inforce business, but must at least provide output by policy duration or issue year for the most recent 10 issue years

- Time Zero Valuation Date
  - 9/30/2021 (to line up with cash flow testing [CFT])
    - Consider option to allow 12/31/2021 upon requests for such

- Model Type
  - Use a model that can project future cash flows over the contract life for the modeled block
    - Can be based on valuation model or pricing model
  - Encourage use of a model that is able to re-project reserves at future time periods (TBD—may be optional)
    - See Section V in this document for additional requirements on projecting future reserves
    - If unable to project, proxy future durations by considering historical inforce product calculations for similar products at the associated duration
    - Seek feedback from potential participants and consider recommendations from consultant

Section II: Assumption Specifications

- Asset Assumptions
  - Use asset assumptions found in Valuation Manual (VM)-22 draft instructions
  - Investment guardrail for fixed income investment strategy set to 5% Treasury, 15% AA, 40% AAA, 40% BBB, unless company-specific investment strategy would result in a higher reserve
  - Set index-based hedging program error to the maximum of the company assumption and [1%], which is deducted from hedge payoffs relative to index credits
    - All other hedging program error set to [5%] of the difference between “best efforts” run and the “adjusted run” CTE70 amounts. This amount is added to the CTE70 “best efforts” run
  - Include margins on company experience assumptions (see subsection below)

- Liability Assumption & Margin Requirements
  - Prudent estimate assumptions for the VM-22 deterministic reserve
    - Set margins on mortality, policyholder behavior, expenses, hedging, non-guaranteed elements (NGEs), withdrawals, and other assumptions as deemed necessary
    - If a company does not wish to use its own margins, then use margins below:

February 8, 2021: Please do not share, distribute or cite this draft document.

© 2021 National Association of Insurance Commissioners
This Document is Not Final and Will Continue to be a Work in Progress

- +/-10% mortality on plus/minus segments, +5% maintenance expenses, +/- 10% on lapses (depending on lapse-supportedness), 150% dynamic lapses, 5% shift from no withdrawals to 10-year GLB withdrawals, index hedging error at 5%?

**Metrics / Output**

- Provide following metrics at time zero
  - CTE70, CTE90, CTE98
  - Commissioners’ Annuity Reserve Valuation Method (CARVM) at valuation (VM-22 AG33, AG35, etc.)
  - C3P1 at valuation date

**Aggregation**

- Calculate in the following three buckets, if possible:
  1. Deferred annuities with GLBs (FIAs or FDAs)
  2. Deferred annuities without GLBs (FIAs or FDAs)
  3. Payout annuities (SPIAs, DIAs, SSC, PRT, longevity reinsurance as applicable)
     - Optional: Split out SPIAs and PRT if not managed together
- Provide mapping for which blocks meet aggregation criteria in current VM-22 framework draft

**Section III: Supplemental Testing**

**Exclusion test exercise**

- Time points tested: Year 0, year 10
- Scenarios Tested: 16 VM-20 economic scenarios for each mortality scenario specified below.
- Mortality Scenarios: +/- 5%
- Exclusion Testing Aggregation: For only the exclusion test, test each of the following subcategories and provide mapping for how products would be aggregated in current VM-22 framework draft:
  - Deferred Annuities
    - FIAs with GLBs
    - FIAs without GLBs
    - FDAs with GLBs
  - Payout Annuities
    - Individual and joint life-contingent SPIA/DIAs
    - Individual non-life-contingent SPIA
    - Pension risk transfer contracts (split out as a separate group for deferred benefits as deemed appropriate)
    - Optional to test structured settlements separately or combine into above sections
  - All Other
    - Please provide brief description of product for other in-scope products not specified above for which results are provided
- Indicate whether or not a hedging program exists for each block

February 8, 2021: Please do not share, distribute or cite this draft document.
This Document is Not Final and Will Continue to be a Work in Progress

Allocation (TBD based on future discussions of allocation method—which may be optional)
Test out the scenario reserve at time = 0 in our proposed allocation scenario (moderately adverse) and assumptions for a few sample policies:
- Sample policies could include: issue age 55 male and female, issue ages 75 male and female
- If available, test these four sample policies out for both a payout annuity product (no CSV) and a deferred annuity product with/without a GLB 75
- Compare our two proposed allocation bases (GPVAD and VM-21-like approach) to the CSV as an allocation basis for these policies to show the difference in results
- Idea is to look at “high risk” and “low risk” policies, and make sure high-risk policies are receiving a greater % allocation. In addition, products generating greater reserves in excess of CSV should receive more allocation.
- Ask participants what challenges were, drawbacks, what improvements are possible, what are implementation challenges, companies provide feedback.

Hedging Survey Questions
- Identify the type of hedging you do for products in VM-22 scope, for example,
  - hedge only index credits for index products,
    - For index credit hedging, are the hedges static, dynamic, or a blend of the two?
  - hedge GLBs and/or other guaranteed benefits,
  - other hedging (e.g., asset-liability matching (ALM) interest rate risk hedging)
- For the case of only hedging index credits, the proposed approach allows simplified modeling, for example, model a hedge error expense such as X% of index account value (AV) notional annualized
  - What do you view as a prudent best estimate for this hedge error?
- For other hedging the VM-21 approach is proposed, weighted average of best efforts and adjusted CTE70 (see formula below), what do you view as an appropriate error factor:
  - Stochastic reserve = CTE70 (best efforts) + E x max[0, CTE70 (adjusted) − CTE70 (best efforts)]

Standard Projection Amount (TBD)
- To the extent there is a standard projection amount proposed, test proposed assumptions and inputs to ensure the calculation is working as intended and producing reasonable results

Revisit as future developments evolve

Section IV: Projections (TBD—may be optional)

Projection Metrics and Future Valuation Nodes
- Project following metrics at projection years 10 and 20:
  - Account value and cash surrender value
  - CARVM (VM-22, AG33, AG35, etc.)
  - CTE70, CTE90, CTE98, Median (specify whether margins are included)
  - For value at risk (VaR)/CTE runs, if available, provide:
    - Actuarial present value of benefits, expenses, and related amounts less the actuarial present value of premiums and related amounts plus the balance of any separate account assets at each valuation time node
    - Present values are calculated using the discount factors implied by the NAER vector under the path of discount rates specified by the economic scenario

February 8, 2021: Please do not share, distribute or cite this draft document.
This Document is Not Final and Will Continue to be a Work in Progress

- For shorter-duration contracts, such as deferred annuities without guarantees and surrender charges < 10 years or annuity certains < 10 years, request projection years 5 and 10lf run-time is hindered, optionally provide only year 10 (year 5 for shorter-duration contracts)

**Population**
- For projections, either create a population using inforce population based on the most recent issue year or use a pricing population (pricing cells) for a single year of issue business based on recent historical inforce business

**Outer Loop Scenario Requirements**
- The outer loop requirements should be based on unmargined PBR experience assumptions
- Use scenario 9 for interest rates and equities from scenario generator for outer loop assumptions
  - Interest rate and equity scenario assumptions will be provided to field testing participants
  - Three sets of 200 scenarios, 600 in total (if including time 0, time 10, time 20), will be provided for field testing participants at each valuation point
- Assume 0.5% mortality improvement and 2% expense inflation
- Assume the company's inforce portfolio mix and reinvestment strategy (ignoring any VM guardrails)
- Use VM prescribed long-term spreads and defaults

**Section V: Sensitivities**
Encourage attribution step analysis from current C3P1 for the new proposed methodology for capital, including quantification of VM-22 reserve updates in interim step (optional):

**Note:** C3P1 CTE metrics may be determined on a pre-tax basis and later adjusted for taxes in line with the C3P2 Macro Tax Adjustment.
The VM-22 (A) Subgroup of the Life Actuarial (A) Task Force met June 16, 2021. The following Subgroup members participated: Bruce Sartain, Chair, and Vincent Tsang (IL); Ted Chang, Ahmad Kamil, Elaine Lam, and Thomas Reedy (CA); Lei Rao-Knight (CT); Mike Yanacheak (IA); Nicole Boyd (KS); William Leung (MO); Rhonda Ahrens (NE); Seong-min Eom (NJ); Bill Carmello and Amanda Fenwick (NY); Rachel Hemphill and Karen Jiang (TX); Tomasz Serbinowski (UT); and Craig Chupp (VA). Also participating was: John Robinson (MN).

1. **Discussed Reserve Category Definitions**

Mr. Sartain said two options for reserve category definitions were discussed by a small drafting group. He said one option is prescriptive and the other is principle-based. He said Mr. Leung has proposed a third option, which uses the VM-22, Statutory Maximum Valuation Interest Rate for Income Annuities, product descriptions. Mr. Chupp presented the prescriptive option (Attachment Twenty-A), which recommends a list of definitive characteristics a fixed annuity must meet to be considered for the payout reserve category and suggests that any fixed annuity that does not fit into the payout category be assigned to the accumulation category. He said consideration was given to defining the accumulation category in accordance with the deferred annuity definition in *Statement of Statutory Accounting Principles (SSAP) No. 50—Classifications of Insurance and Managed Care Contracts* and categorizing fixed annuities that are unable to meet the definition as payout annuities. He said that direction was not chosen because the SSAP definition seemed applicable only to traditional deferred annuities and would not capture current products such as annuities with guaranteed minimum withdrawal benefits (GMWBs). He said the drafting group considered using the VM-22 product descriptions, but it decided to go in this other direction; although, the Subgroup may ultimately decide to expose the VM-22 product descriptions. Mr. Carmello suggested that the reference to guaranteed payments in payout category criteria 1.b. be changed to certain payments to differentiate it from life contingent payments, which are also guaranteed. Mr. Robinson suggested changing the word “and” in criteria 1.a. to the word “or.” He also suggested that criteria 1.a. be worded to include both level and non-level payments that are predetermined.

Mr. Serbinowski suggested consideration of the principle-based risk categories approach. Mr. Sartain said the principle-based option (Attachment Twenty-B) is designed to avoid risk offsets between disintermediation and reinvestment risks. He said the approach leaves the company to decide how to measure the disintermediation risk and reinvestment risk and how policies are to be grouped. He stressed that documentation of the company’s risk measurement and grouping decisions should be required. Ben Slutsker (American Academy of Actuaries—Academy) said information on how companies currently treat disintermediation risk and reinvestment risk within their risk management programs may be helpful in establishing the principle-based risk categories approach. He said the general feedback from the Academy on the prescriptive approach mirrors the concerns of some Subgroup members. He said the Academy prefers the principle-based approach. He said if the Subgroup prefers a prescriptive approach, more consideration should be given to the VM-22 product description option, as that is more like the VM-20, Requirements for Principle-Based Reserves for Life Products, approach. Mr. Sartain said based on the feedback from the Subgroup and the Academy, the prescriptive approach may be eliminated from consideration. Ms. Ahrens said the risk category discussions seem to have excluded consideration of the mortality risk inherent in fixed annuity products. Mr. Slutsker responded that the Academy fixed annuity framework considers longevity risk as part of exclusion testing.

Having no further business, the VM-22 (A) Subgroup adjourned.
Proposed Definition of Payout Annuity Category:

The “Payout Annuity Category” shall only consist of annuities which meet all of the criteria in 1 through 3 below:

1. The annuity must include only one or more combinations of the types of payment streams listed in 1.a and 1.b, below:
   a. Life contingent payments of a fixed amount, certain payments of a total fixed amount, and certain payments for a fixed period.
   b. If acceleration of payments is permitted, the amount of each acceleration shall be no more than six months of payments or a present value of remaining guaranteed payments.

2. The actual payment start date may change by no more than five years from the original payment start date that was established when the contract was issued.

3. The amount of any elective withdrawal or cash out option available prior to the payment start date shall be no more than the sum of the premiums paid.
Reserve Category Definitions

The Accumulation Reserve Category contains contracts with greater disintermediation risk than reinvestment risk as of the valuation date.

The Payout Reserve Category contains contracts with greater reinvestment risk than disintermediation risk as of the valuation date.

Guidance Note: Contracts with a material cash surrender value, a reasonable expectation of a future material cash surrender value, or with material withdrawal or acceleration options, should be in the Accumulation Reserve Category. Reasonable grouping of contracts is allowed. Appropriate documentation within the VM-31 Actuarial Report of the determination process is a required component of this principle-based approach.
The VM-22 (A) Subgroup of the Life Actuarial (A) Task Force met May 26, 2021. The following Subgroup members participated: Bruce Sartain, Chair, and Vincent Tsang (IL); Ted Chang, Ahmad Kamil, Elaine Lam and Thomas Reedy (CA); Lei Rao-Knight (CT); Mike Yanacheak (IA); Nicole Boyd (KS); William Leung (MO); Rhonda Ahrens (NE); Seong-min Eom (NJ); Bill Carmello and Amanda Fenwick (NY); Rachel Hemphill and Karen Jiang (TX); Tomasz Serbinowski (UT); and Craig Chupp (VA).

1. **Discussed Materiality Standards**

Ms. Hemphill said VM-20, Requirements for Principle-Based Reserves for Life Products, has a section that specifically requires materiality standards and a section that specifically authorizes the use of simplifications and approximation. She said VM-21, Requirements for Principle-Based Reserves for Variable Annuities, does not discuss those items. She said that an amendment proposal that adds materiality standards and allows simplifications and approximations to VM-21 has been submitted to the Life Actuarial (A) Task Force. She said the VM-22, Statutory Maximum Valuation Interest Rate for Income Annuities, revisions should mirror those requirements. Ben Slutsker (American Academy of Actuaries—Academy) suggested that might be a topic more for the Subgroup that the Academy could react to if desired. Cindy Barnard (Pacific Life) asked if materiality should be addressed at the Valuation Manual level, instead of addressing it separately in VM-20, VM-21, and VM-22. Mr. Sartain said that will be added to the issues list and could be discussed after amendment proposal 2020-09 is decided on for VM-21.

2. **Discussed Aggregation Language**

Mr. Sartain said Subgroup discussions have yielded three options for addressing aggregation in VM-22. The first option is to carry over the language from VM-20 Section 5.A verbatim. The second option is to modify the VM-20 language for VM-22 products. The third option is to remove the language from the fixed annuity framework recommendation. Ms. Hemphill discussed the draft document (Attachment Twenty-One-A) with the details of the original language and two options with revised language. She said the drafting group that worked on the language was split over option one and option two. Mr. Sartain said that the guidance note seems to define additional reserve categories. He asked if consideration was given to incorporating the guidance note into the body of option one. Mr. Carmello agreed that the guidance note should be worked into the body and that essentially, the Subgroup is talking about reserve categories. Mr. Slutsker said the Academy believes that both options obstruct the objective of principle-based reserving (PBR). He said the reserves should be tied to the anticipated economics of the policy and have an explicit margin added for conservatism. He said the option one approach results in a margin that is unintuitive instead of explicit. He said the prescriptive approach in the options may result in attempts to develop workarounds. He said the Academy prefers the original language. Mr. Serbinowski agreed, saying the options may discourage companies from appropriately managing economic risks. Ms. Hemphill agreed that a single risk category would be the best solution but said that the original language adds no value to the reserve determination process. She recommended removing the original language. Mr. Sartain raised the possibility of revoting to determine the number of reserve categories for VM-22.

Having no further business, the VM-22 (A) Subgroup adjourned.
May 26, 2021
VM-22 Subgroup

1. Subgroup aggregation language in VM-20 (5)(A) – two draft revisions (Texas, Nebraska, NY)

   a. Existing language
      In determining the stochastic reserve, the company shall determine the number and composition of subgroups for aggregations purposes in a manner that is consistent with how the company manages risks across products with significantly different risk profiles, and that reflects the likelihood of any change in risk offsets that could arise from the distributional shifts between product type due to, for example, differing policyholder behavior. If a company is managing the risks of two or more products with significantly different risk profiles as part of an integrated risk management process, then the products may be combined into the same subgroup for aggregation purposes.

   b. Option 1
      In determining the stochastic reserve, the company shall determine the number and composition of subgroups for aggregations purposes. Products with significantly different risk profiles shall not be combined into the same subgroup for aggregation purposes.

      **Guidance Note:** For example, multi-year guarantee annuities may not be aggregated with annuities with one-year resets, annuities without GMxBs may not be aggregated with annuities with significant GMxBs, and fixed annuities may not be aggregated with indexed annuities.

   c. Option 2
      In determining the stochastic reserve, the company shall determine the number and composition of subgroups for aggregation purposes in a manner that identifies distinct subgroups of contracts, reflecting how contracts were priced, marketed, and managed. This will typically result in different subgroups for distinct product types. Other criteria that may be considered include, but are not limited to: marketing methods, target market, presence of GMxBs, to the extent that such criteria materially affect how contracts are priced, marketed, and managed. Whichever criteria are used, each grouping should be large enough to be material.

      **Guidance Note:** For example, multi-year guarantee annuities may not be aggregated with annuities with one-year resets, annuities without GMxBs may not be aggregated with annuities with significant GMxBs, and fixed annuities may not be aggregated with indexed annuities, when such groups of annuities are each of a material size.
The VM-22 (A) Subgroup of the Life Actuarial (A) Task Force met May 12, 2021. The following Subgroup members participated: Bruce Sartain, Chair, and Vincent Tsang (IL); Ted Chang, Ahmad Kamil, Elaine Lam and Thomas Reedy (CA); Lei Rao-Knight (CT); Mike Yanacheak (IA); Nicole Boyd (KS); William Leung (MO); Rhonda Ahrens (NE); Seong-min Eom (NJ); Bill Carmello and Amanda Fenwick (NY); Rachel Hemphill and Karen Jiang (TX); Tomasz Serbinowski (UT); and Craig Chupp (VA).

1. **Discussed the Definition of Reserve Categories**

Mr. Chupp said a drafting group is proposing definitions for the two reserve categories voted on by the VM-22 (A) Subgroup for non-variable annuities. The proposal defines a payout annuity category and a yet to be named category covering all products that do not meet the payout annuity definition. He said the payout annuity category definition has two requirements: 1) the policy must have fixed payment streams that are affected only by death; and 2) the policyholder is not permitted to deposit additional funds or withdraw funds. He said the definition allows a deferred policy to be moved to the payout annuity category at the commencement of annuitization, assuming the policy meets the two payout category requirements. He noted that the Subgroup could also consider options that would either lock in the definition of the contract at the time of issue or allow a principle-based approach for defining the contract.

Cindy Barnard (Pacific Life) asked if the payout annuity definition includes deferred income annuities (DIAs) that allow for additional premiums after issue. Mr. Carmello said those products should be considered payout annuities and that the distinguishing feature should be whether there is a disintermediation issue. Mr. Leung said the intent of the drafting group was to develop a strict definition that the Subgroup could adjust as needed to reflect optionality. Ben Slutsker (American Academy of Actuaries—Academy) said the Academy view is that some level of materiality should be considered when attempting to reflect optionality.

Ms. Barnard said asked if a pension risk transfer (PRT) contract without a fixed annuitization date fits into the deferred or payout category. Mr. Chupp responded that if the payout amount is scheduled, and there is no account value, the contract would be considered a payout annuity. Ms. Barnard asked if a cash refund annuity with a cash withdrawal option would be considered a payout annuity. Mr. Leung said the drafting group definition is intended to exclude hardship withdrawals. He said that the Subgroup could expand the definition if needed.

Mr. Yanacheak said differentiating categories based on disintermediation risk makes sense. He said it is difficult to determine whether disintermediation risk should be the lone differentiation criterion without seeing the reserve methodology. He said an essential aspect of the reserving category decision is whether a policy moving from one category to the other can make that transition smoothly. He suggested that the Subgroup should be sure to consider the treatment for contingent deferred annuities (CDAs) when discussing product optionality.

2. **Discussed the Deviations from VM-21 Document**

Mr. Slutsker said the Academy’s preliminary framework recommendation is based on VM-21, Requirements for Principle-Based Reserves for Variable Annuities, with revisions to address the fixed annuity framework. He said the fixed annuity principle-based reserving (PBR) deviations from the VM-21 document (Attachment Twenty-Two-A), provided in response to a Subgroup member request, delineate the VM-21 requirements that the Academy proposes to change to appropriately reserve for fixed annuities.

Having no further business, the VM-22 (A) Subgroup adjourned.
March 15, 2021

Honorable Bruce Sartain, Chair
Valuation Manual (VM)-22 (A) Subgroup
National Association of Insurance Commissioners (NAIC)

Dear Mr. Sartain,

The American Academy of Actuaries\(^1\) Annuity Reserves Work Group (ARWG) presented a fixed annuity principle-based reserving (PBR) framework proposal on the October 21, 2020, NAIC VM-22 Subgroup call. The work group subsequently received a request from you to provide a summary of the differences between the proposal and current framework for VM-21 (variable annuity PBR). Furthermore, it was asked whether each deviation from VM-21 could be classified as either a change that would be specific to fixed annuity PBR or a change that the ARWG would recommend making to VM-21 and VM-20 (life PBR) as well for future versions of the NAIC Valuation Manual. The ARWG (now, Annuity Reserves and Capital Work Group [ARCWG]) worked with the chairpersons of the Academy’s Life Reserves Work Group (LRWG) and Variable Annuity Reserves and Capital Work Group (VARCWG) to come up with the following grid.

We ask for the VM-22 Subgroup’s consideration to include this grid as a supplement to the exposed ARWG Preliminary Framework (October 2020) on fixed annuity PBR, which may provide more clarity to regulators and interested parties in their consideration of the Framework.

Please let us know if you have any follow-up inquiries in response to this document. Again, we appreciate the opportunity to present the fixed annuity framework and all of the efforts made by the NAIC VM-22 Subgroup to focus on this topic.

Sincerely,

Ben Slutsker
Chairperson, Annuity Reserves and Capital Work Group
American Academy of Actuaries

CC: Reggie Mazyck, NAIC

\(^1\) The American Academy of Actuaries is a 19,500-member professional association whose mission is to serve the public and the U.S. actuarial profession. For more than 50 years, the Academy has assisted public policymakers on all levels by providing leadership, objective expertise, and actuarial advice on risk and financial security issues. The Academy also sets qualification, practice, and professionalism standards for actuaries in the United States.
## Fixed Annuity PBR Deviations from VM-21

**Description:** This grid summarizes deviations between the proposed ARWG fixed annuity PBR framework and the current VM-21 requirements. The remaining framework elements not listed in this grid are generally proposed to be the same as the current VM-21 requirements. A description and rationale for the proposed deviations are provided, along with a suggestion for whether each item should be explored for possible updates to VM-20 and VM-21 going forward as well.

<td>Product Scope</td>
<td>Fixed annuity PBR would apply to only non-variable annuity contracts</td>
<td>Scope of products to focus on non-variable annuity contracts</td>
<td>No</td>
<td>No</td>
<td>Scope of products is different; ARWG/ARCWG still reviewing hybrid VA/fixed contracts</td>
</tr>
</tbody>
</table>

**Note:**

1. The ARWG fixed annuity framework proposes to only set this treatment for programs supporting index credits. There is a separate treatment proposed for future hedging programs that follow guaranteed living benefits and other liabilities, which is to follow the methodology laid out in VM-21 requirements for future hedging programs.

2. For index universal life (IUL), VM-20 also requires a deterministic reserve (subject to exclusion testing). In 2020, VM-20 was amended to set the crediting rate in the deterministic reserve based on the methodology outlined in AG63. No deterministic reserve, this treatment is not applicable to VM-22. In addition, VM-20 only requires hedging to be included in future cash flows if the program is a CDHS. VM-20 also prohibits exclusion testing for blocks with CDHS programs.
The VM-22 (A) Subgroup of the Life Actuarial (A) Task Force met May 5, 2021. The following Subgroup members participated: Bruce Sartain, Chair, and Vincent Tsang (IL); Ted Chang, Ahmad Kamil, Elaine Lam and Thomas Reedy (CA); Lei Rao-Knight (CT); Nicole Boyd (KS); William Leung (MO); Rhonda Ahrens (NE); Seong-min Eom (NJ); Bill Carmello and Amanda Fenwick (NY); Rachel Hemphill and Karen Jiang (TX); and Craig Chupp (VA).

1. Discussed the Academy ARCWG Preliminary Framework

Chris Conrad (American Academy of Actuaries—Academy) said in its Preliminary Framework recommendation from the Subgroup’s April 21 minutes, the Academy Annuities Reserve and Capital Work Group (ARCWG) has proposed that the fixed annuity hedging requirements be consistent with VM-21, Requirements for Principle-Based Reserves for Variable Annuities, with the exception that: 1) all future hedging programs tied directly to contracts should be modeled, regardless of whether the hedging program is considered a clearly defined hedging strategy (CDHS); and 2) indexed credits should be allowed to be modeled under an alternative methodology that reflects the hedge breakage expense in the 70% conditional tail expectation (CTE70) best efforts by reducing hedge payoffs relative to modeled index credits through the use of an effectiveness multiple. He said an adjusted CTE70 run will not be required. He said the ARCWG supports the exceptions because hedging programs on indexed credits typically have lower basis risk and are more effective.

Ms. Hemphill said the Texas Department of Insurance (TDI) comment letter from the Subgroup’s April 21 minutes points out that the CDHS concept is necessary in cases where reserves or total asset requirement (TAR) is materially reduced. She said the CDHS requirements, which are documentation requirements, demonstrate that the hedging program is robust and therefore reliable. Mr. Sartain said requiring a CDHS if the modeling decreases the reserve seems to be a reasonable principle-based approach. Brian Bayerle (American Council of Life Insurers—ACLI) said there are other considerations around the modeling of hedges, such as the overhead related to running scenarios. He suggested a survey to understand the landscape of the existing hedge programs and why some of those programs may not conform to CDHS requirements. Mr. Sartain said the issue is broader than what the Subgroup is addressing, and it should be resolved at the Task Force level.

Ms. Hemphill asked how the variability in company expense levels will be reflected in the proposed modeling approach. Ben Slutsker (Academy) said the expenses are included in the cash flows. He said the hedge breakage expense can be viewed as a risk charge. Ms. Hemphill asked if the modeling approach truly reflects both the company’s typical back-testing error and modeling error. Mr. Slutsker confirmed that the total error is being reflected. He said a field test would be helpful in determining a minimum hedge breakage expense. Ms. Hemphill said the hedge modeling approach adopted for fixed annuities should also be considered for VM-20, Requirements for Principle-Based Reserves for Life Products. Mr. Bayerle said the ACLI believes that any modeling simplification should be optional.

Mr. Conrad said the ARCWG believes the hedging cost scope and documentation should be consistent with VM-21.

Having no further business, the VM-22 (A) Subgroup adjourned.
The VM-22 (A) Subgroup of the Life Actuarial (A) Task Force met April 28, 2021. The following Subgroup members participated: Bruce Sartain, Chair, and Vincent Tsang (IL); Ted Chang, Ahmad Kamil, Elaine Lam and Thomas Reedy (CA); Lei Rao-Knight (CT); Nicole Boyd (KS); William Leung (MO); Rhonda Ahrens (NE); Seong-min Eom (NJ); Bill Carmello and Amanda Fenwick (NY); Rachel Hemphill and Karen Jiang (TX); Tomasz Serbinowski (UT); and Craig Chupp (VA).

1. Discussed the Academy ARCWG Preliminary Framework

Chris Conrad (American Academy of Actuaries—Academy) said in its Preliminary Framework recommendation from the Subgroup’s April 21 minutes, the Academy Annuities Reserve and Capital Work Group (ARCWG) has proposed that VM-22, Statutory Maximum Valuation Interest Rates for Income Annuities, should use the same mortality methodology as VM-21, Requirements for Principle-Based Reserves for Variable Annuities. He said the methodology includes using prudent estimate mortality, with mortality improvement reflected using the G-2 scale. Ms. Hemphill said the Texas Department of Insurance (TDI) comment letter from the Subgroup’s April 21 minutes questioned the use of the term “unsupported judgment,” asked what mortality basis is appropriate for international lives, and asked how many years of mortality improvement will be used. Mr. Sartain said either the Pension Risk Transfer (PRT) Mortality Drafting Group or the Standard Projection Amount (SPA) Drafting Group can pursue the issue of the mortality basis for international lives. Mr. Conrad reiterated that the ARCWG’s current approach is to be consistent with VM-21 on the issues of mortality basis and mortality improvement. Ms. Hemphill said there may be other resources more appropriate than VM-21. She said VM-20, Requirements for Principle-Based Reserves for Life Products, Section 9.C.3.b provides flexibility to identify appropriate tables on a case-by-case basis. Paul S. Graham (American Council of Life Insurers—ACLI) said the mortality-related comments in the ACLI comment letter from the Subgroup’s April 21 minutes aligns with the TDI comments.

Mr. Conrad said the ARCWG policyholder behavior recommendations are also consistent with VM-21. Ms. Hemphill said VM-20 and VM-21 take different approaches to margin setting. She suggested re-evaluating the two approaches to determine a “best” version that could then be used for VM-20, VM-21 and VM-22. She noted that reporting requirements should include showing the impact of margins and actual-to-expected ratios. Mr. Sartain said he will add the comments to an issues list, but he does not believe the drafting group is responsible for harmonizing the VM-20, VM-21 and VM-22.

Mr. Conrad said the ARCWG non-guaranteed elements recommendation is for VM-22 to be consistent with VM-20. Ms. Hemphill suggested that VM-22 should explicitly indicate that company policies and past actions should be reflected in the development of non-guaranteed elements. She said this issue should be added to the issues list.

Mr. Conrad said the ARCWG recommends that policy loans assumptions should be consistent with VM-20, while expenses and account transfers should be consistent with VM-21. He said joint payouts and supplemental benefits should be reserved for using reasonable methods. Ms. Hemphill said whatever reasonable methods are developed for VM-22 should also be applied to VM-21. Mr. Conrad said the ARCWG recommends that the treatment of reinsurance should follow the VM-21 requirements.

Ms. Hemphill said the ARCWG approach to reflecting risk in moderately adverse conditions is fundamentally different from the principle-based reserving (PBR) for economic scenarios. She said the treatment of tail risks in stochastic modeling should ensure that the risks that are deeper in the tail are being appropriately considered.

Having no further business, the VM-22 (A) Subgroup adjourned.

Valuation Manual (VM)-22 (A) Subgroup  
Virtual Meeting  
April 21, 2021

The VM-22 (A) Subgroup of the Life Actuarial (A) Task Force met April 21, 2021. The following Subgroup members participated: Bruce Sartain, Chair, and Vincent Tsang (IL); Ted Chang, Ahmad Kamil, Elaine Lam and Thomas Reedy (CA); Lei Rao-Knight (CT); Mike Yanacheak (IA); Nicole Boyd (KS); William Leung (MO); Rhonda Ahrens (NE); Seong-min Eom (NJ); Anna Krylova (NM); Bill Carmello and Amanda Fenwick (NY); Rachel Hemphill and Karen Jiang (TX); and Craig Chupp (VA).

1. Tabled a Motion to Retain the VM-20 Integrated Risk Management Language

Mr. Sartain recapped the March 17 Subgroup discussion on whether to retain the language in Section 5A of VM-20, Requirements for Principle-Based Reserves for Life Products, that allows for the aggregation of products with significantly different risk profiles if the products are managed as part of an integrated risk management process. He said the Subgroup discussed that reviews of VM-20 principle-based reserving (PBR) actuarial reports indicate that most companies feel they have integrated risk management processes and have used full aggregation within reserve categories. He recalled that Subgroup members differed on whether the Section 5A language is currently able to address their aggregation concerns or if language improvement is required. Ms. Hemphill, Mr. Carmello and Ms. Ahrens volunteered to work on improvements to the Section 5A integrated risk management process language.

Mr. Sartain said a previous straw vote to decide whether the standard projection amount (SPA) should be a floor or disclosure item was taken during the March 17 discussion. Ms. Ahrens said given that the uncertainty of how widely the stochastic results may vary makes it difficult to consider a standard projection or floor, it is too early to decide. She suggested deferring the SPA decision until after the field test, while proceeding with the decision to have two reserve categories. Mr. Leung said it will be difficult to determine the SPA without understanding critical policyholder behaviors. He said the Subgroup should consider retaining the cash value floor. Mr. Sartain noted that an SPA drafting group is working on defining policyholder behavior characteristics. Mr. Carmello said he favors using the Commissioners Annuity Reserve Valuation Method (CARVM) as the floor. The Subgroup agreed to wait until the field test is complete before determining the purpose and use of the SPA.

Mr. Sartain discussed the straw vote that resulted in the Subgroup deciding to use two reserving categories: one category for payout annuities and another for deferred annuities. He said more thought must be given to assigning specific products to the two risk categories. He said products like deferred income annuities (DIAs) and deferred annuities with a guaranteed minimum withdrawal benefit (GMWB) that have been exercised but still have remaining cash value are not easily categorized. Mr. Carmello said the risk category distinction should be based on whether the product has a cash value. He acknowledged that multiple categories may be required for deferred annuities, including a separate category for equity-indexed annuities. Ben Slutsker (American Academy of Actuaries—Academy) said DIAs are similar to single premium immediate annuities (SPIAs) with the payments commencing at a set date in the future. He said DIAs have no account value, but they might have a return of premium or hardship return option available during the deferral period. He said those options are infrequently elected. Mr. Sartain said the DIA seems to fit into the payout annuity category. Mr. Chang asked where structured settlements would fit. Mr. Slutsker said there are a variety of structured settlement products, so the response requires some thought. Mr. Leung said the product list in VM-22, Statutory Maximum Valuation Interest Rates for Income Annuities, might be a good starting point for determining which products fit into the reserve categories. Mr. Slutsker said using that approach still leaves questions of how the products should be treated during any transition periods. Mr. Leung and Mr. Chupp volunteered to develop definitions for payout annuities.

Having no further business, the VM-22 (A) Subgroup adjourned.
Future Mortality Improvement Recommendation (VM-20)

Mortality Improvements Life Work Group (MILWG) of the Academy Life Experience Committee and SOA Preferred Mortality Project Oversight Group (“Joint Committee”)

Individual Life Insurance
Future Mortality Improvement (FMI) for VM-20 Products

GOAL: To allow a prudent level of future mortality improvement (FMI) for VM-20 products beginning with the 2022 valuation manual

- FMI scale will be developed, updated and made available to practitioners annually
- Updates will be limited to a threshold of materiality for making a change
- Two versions of the scale will be published: Basic ("Best Estimate") and Loaded ("with margin")
- Period of scale application: 20 years
- Varies by gender and attained age
Topics for Presentation

- FMI scale methodology—review and example rates for 2020
- Recommended FMI scale impact on reserves
- Margin recommendation
- Next steps/future considerations

FMI Scale Development—Methodology Review

- Best estimate FMI grades from the historical basis to a long-term MI rate (“LTMIR”) at 10 years
- Remains level from 10 to 15 years
- Grades to no additional improvement at 20 years
- Separate exercise for initial published scale to consider COVID-19 impacts
Example Best Estimate FMI Rates
Unsmoothed—Male—2020 Valuation

Example Best Estimate FMI Rates
Unsmoothed—Female—2020 Valuation
2020 Smoothed Best Estimate FMI Rates

Male Smoothed—Best Estimate MI Rates

Female Smoothed—Best Estimate MI Rates

Reserve Impact Estimates

- Universal Life with Secondary Guarantees (ULSG) focus—long-duration product, larger potential for reserve reduction
  - Model office and assumptions same as used in the YRT representative model analysis
  - Lifetime shadow account secondary guarantee
  - No reinsurance in the model
- Combined model office

Reserve Impact Estimates
Future Mortality Improvement Assumption Model Implementation

- The 2021 and prior versions of VM-20 prohibited including FMI in the calculation of deterministic and stochastic reserves, while allowing the mortality assumption to be improved up to the valuation date using a historical mortality improvement (HMI) assumption developed by the MILWG.

- An “exact” approach to including FMI in the calculation of deterministic and stochastic reserves would utilize the MILWG’s HMI assumption to bring the mortality table up to the valuation date and then apply the separate FMI assumptions beyond the valuation date.

A modeling simplification was employed that utilized the new MILWG FMI assumption as both HMI and FMI in the deterministic reserve projection.

This simplification allows for the impact of including FMI in current and future deterministic reserve calculations to be quantified.
Reserve Impact Estimates
ULSG Model Office Results

- Baseline reserves—no FMI
- Best estimate—reserves with FMI at best estimate level
- Margin 25%—FMI at best estimate level with 25% reduction across all gender/ages
- Margin 35%—FMI at best estimate level with 35% reduction across all gender/ages

Model Office Results—Percent Change From Baseline Reserve Level

Reserve Impact by Smoker Status

ULSG FMI—Reserve Impact Estimates
Single Cell Results—Percent Change From Baseline Reserve Level
Margin Recommendation

MARGIN ON THE INCREMENTAL MORTALITY IMPROVEMENT SCALE

- Margin will be included for all companies
  - Companies may use a more conservative MI scale but not less conservative
  - Margin will take the form of a flat % reduction in the best estimate MI scale
    - Recommendation for 25% flat reduction

Considerations in Margin Recommendation

- 25% reduction in best estimate scale is a material cushion to reserve impact

- Conservatism in best estimate MI scale
  - Not explicitly included
  - Methodology has some conservatism—i.e., limiting cumulative improvements to 20 years

- Ability to change best estimate MI scale each year
  - No lock in of assumptions under VM-20
  - Corrections can be made if trends change
Next Steps

CONTINUED CONSIDERATIONS

- Consideration of COVID-19 impacts when we reach 2020 historical data inclusion
  - Shock
  - Potential longer-term impacts
  - Baseline company experience—potential differences in how companies reflect COVID-19 impacts
  - COVID-19 impact different for population vs. insured population
- Threshold of materiality for making a change in a given year

Future Considerations

OTHER ISSUES DISCUSSED

- Impacts of opioid epidemic
- Socioeconomic differences (between general and insured population)
- Obesity impacts
- Mental health impacts
- Slowdown in cardiovascular mortality improvement
- Smoker status

Economic Scenario Generator (ESG) Update

Scott O’Neal, FSA, MAAA – NAIC Life Examination Actuary
Dan Finn, FCAS, ASA – Managing Director at Conning

8/12/2021

Agenda

1. Activities of the ESG Drafting Group
2. Key goals for a new GEMS ESG Treasury model calibration
3. Treasury model targeting impacts and tradeoffs
4. Next Steps
Background

The NAIC’s ESG Drafting Group is working to develop ESG recommendations to the Life Actuarial (A) Task Force and Life RBC (E) Working Group and is comprised of:
• Regulators,
• NAIC staff,
• Conning staff, and
• Subject-matter experts.

The subject-matter experts include representatives from the American Academy of Actuaries and the American Council of Life Insurers, life insurance industry professionals, and academics.

Activities of the ESG Drafting Group

• The group’s immediate focus is to develop a set of recommendations for the GEMS Treasury model and an associated set of scenarios for consideration by LATF and the LRBC WG.
• The development of scenarios for eventual use in statutory reserve and capital requirements is an iterative process and multiple recalibrations of the GEMS ESG are expected before a recommendation for field testing is delivered. The group is currently reviewing a new calibration of the Treasury model and expects to make changes.
• Meetings of the group are focused on reviewing scenario output. A SharePoint site has been set up for the group to handle more technical discussions and share additional analysis of the scenario sets.
Key Goals for a New Treasury Model ESG Calibration

All targets are at end of Year 30, unless specified otherwise

1. Make sure there are enough low-for-long scenarios
2. Make sure there are enough high-for-long scenarios
3. Reduce frequency and severity of negative Yields at the shorter tenors relative to the “Revised Baseline” scenarios that were previously exposed February 24th, 2021
4. Reduce short and long inversion frequencies relative to the Revised Baseline
5. Reduce frequency of other Yield curve shapes (i.e. bowls and humps) relative to the Revised Baseline
6. Ensure that 30-Year Yield can stay below December 2020 levels (i.e. 1.65%)
7. Avoid generating a substantial probability of negative Yields for longer tenors (i.e. 10+ years)
8. Increase probability of 10%+ Yields for all tenors relative to the Revised Baseline
9. Avoid generating substantial probability of Yields over 25%
10. Adjust 20-Year Yield target (MRP) to be based on the median rather than the mean to be consistent with the AIRG target
11. Adjust Term Premiums to align with MRP methodology

ESG Targeting Impacts and Tradeoffs

* Assumes that “Low” and “High” are defined relative to the MRP. For example, in these slides, we’ve taken “Low” as being below MRP – 2.0% (i.e. 1.5%)
** Assumes that the “Low” and “High” calculations are based on the 20-Year Yield
**Next Steps**

1. The ESG Drafting Group will continue to review scenario output from additional calibrations of the GEMS Treasury model.

2. Once the group has settled on a set of recommendations for the Treasury model and associated set of scenarios, the recommendations will be brought to a joint open meeting of the Life Actuarial (A) Task Force and Life RBC (E) Working Group.
2021 GRET Recommendation

Tony Phipps, FSA, MAAA
Chair SOA Committee on Life Insurance Expenses
August 12, 2021

Presentation Disclaimer

GRET Agenda

- Methodology
- Recommendation
- Comparison to Prior Years
- Information on Companies in Study

Methodology

- Select data points provided by NAIC from company Annual Statement submissions
- SOA surveyed companies to determine Distribution Channels
- SOA analyzed data to derive unit expense factors by those Distribution Channels
Additional Comments on Methodology

• Allocated expenses to acquisition and maintenance categories using the same seeds as has been previously used
  • Acquisition/Policy: $200.00
  • Acquisition/Face Amount: $1.10
  • Acquisition/Premium: 50%
  • Maintenance/Policy: $60.00

Information on Companies in Study

- The following percentages of companies responded that GRET factors are used for individual life sales illustration purposes:
  - 2021 Survey: 31%
  - 2020 Survey: 29%
  - 2019 Survey: 26%
  - 2018 Survey: 28%
  - 2017 Survey: 30%
  - 2016 Survey: 26%

- We believe variation is a result of the mix of respondents and the limited number of responses

- Included 375 companies in this year’s study
  - Increase of 83 companies from last year’s study.
  - Much of this increase is due to companies that were not included in the 2021 calculations due outliers in the 2018 data.

- There were a total of 771 companies originally in the data received from the NAIC in this year’s data extraction versus 776 in last year
  - Total ordinary policies issued for these 771 companies remained essentially flat (30K more policies out of a total of 10.1M) over the prior year
  - Face amount issued increased by 2.6% over the prior year
Questions
TO:     Reggie Mazyck, NAIC
FROM:   Pete Miller, Experience Study Actuary, Society of Actuaries (SOA)
         Tony Phipps, Chair, SOA Committee on Life Insurance Company Expenses
DATE:   August 4, 2021
RE:     2022 Generally Recognized Expense Table (GRET) – SOA Analysis

Dear Mr. Mazyck:

As in previous years, the Society of Actuaries expresses its thanks to NAIC staff for their assistance and responsiveness in providing Annual Statement expense and unit data for the 2022 GRET analysis for use with individual life insurance sales illustrations. The analysis is based on expense and expense related information reported on companies’ 2019 and 2020 Annual Statements. This project has been completed to assist the Life Actuarial Task Force (LATF) in its consideration of potential revisions to the GRET that could become effective for calendar year 2022. This memo describes the analysis and resultant findings.

NAIC staff provided Annual Statement data for life insurance companies for calendar years 2019 and 2020. This included data from 776 companies in 2019 and 771 companies in 2020. This decrease resumes the trend of small decreases from year to year. Of the total companies, 375 were in both years and passed the outlier exclusion tests and were included as a base for the GRET factors (292 companies passed similar tests last year).

APPROACH USED
The methodology for calculating the recommended GRET factors based on this data is similar to that followed the last several years. The methodology was last altered in 2015. The changes made at that time can be found in the recommendation letter sent to LATF on July 30, 20151.

To calculate updated GRET factors, the average of the factors from the two most recent years (2019 and 2020 for those companies with data available for both years) of Annual Statement data was used. For each company an actual-to-expected ratio was calculated. Companies with ratios that fell outside predetermined parameters were excluded. This process was completed three times to stabilize the average rates. The boundaries of the exclusions have been modified from time to time; however, there were no adjustments made this year. Unit expense seed factors (the seeds for all distribution channel categories are the same), as shown in Appendix B, were used to compute total expected expenses. Thus, these seed factors were used to implicitly allocate expenses between acquisition and maintenance expenses, as well as among the three acquisition expense factors (on a direct of ceded reinsurance basis).

Companies were categorized by their reported distribution channel (four categories were used as described in Appendix A included below). There remain a significant number of companies for which no distribution channel was provided, as no responses to the annual surveys have been received from those companies. The characteristics of these companies vary significantly, including companies not currently writing new business or whose major line of business is not individual life insurance. Any advice or assistance from LATF in future

1 https://www.soa.org/Files/Research/Projects/research-2016-gret-recommendation.pdf
years to increase the response rate to the surveys of companies that submit Annual Statements in order to reduce the number of companies in the “Other” category would be most welcomed. The intention is to continue surveying the companies in future years to enable enhancement of this multiple distribution channel information.

Companies were excluded from the analysis if in either 2019 or 2020 (1) their actual to expected ratios were considered outliers, often due to low business volume, (2) the average first year and single premium per policy were more than $40,000, (3) they are known reinsurance companies or (4) their data were not included in the data supplied by the NAIC. To derive the overall GRET factors, the unweighted average of the remaining companies’ actual-to-expected ratios for each respective category was calculated. The resulting factors were rounded, as shown in Table 1.

THE RECOMMENDATION
The above methodology results in the proposed 2022 GRET values shown in Table 1. To facilitate comparisons, the current 2021 GRET factors are shown in Table 2. Further characteristics of the type of companies represented in each category are included in the last two columns in Table 1, including the average premium per policy issued and the average face amount ($000s) per policy issued.

To facilitate comparisons, the current 2021 GRET factors are shown in Table 2. Further characteristics of the type of companies represented in each category are included in the last two columns in Table 1, including the average premium per policy issued and the average face amount ($000s) per policy issued.

In previous recommendations, an effort was made to reduce volatility in the GRET factors from year-to-year by limiting the change in GRET factors between years to about ten percent of the prior value. The changes from the 2021 GRET were reviewed to ensure that a significant change was not made in this year’s GRET recommendation.

The Independent, Niche Marketing and Other distribution channel categories experienced a change greater than ten percent so the factors for this line were capped at the ten percent level (the Acquisition per unit factor changed somewhat more than 10% because of rounding) from the corresponding 2021 GRET values. The volatility occurred due to incorrect NAIC data for 2018 for some companies, which caused their actual to expected ratios to be considered outliers and they were not included in the calculation. This resulted in lower final 2021 GRET factors and subsequently the same for the 2022 recommendation. Over the next one to three years, the ten percent cap will allow this difference to be graded in so calculated GRET will be used for the final recommended GRET factors.

**USAGE OF THE GRET**

This year’s survey, responded to by companies’ Annual Statement correspondent, included a question regarding whether the 2021 GRET table was used in its illustrations by the company. Last year, 29% of the responders indicated their company used the GRET for sales illustration purposes, with similar percentage results by size of company; this contrasted with about 28% in 2019. This year, 31% of responding companies indicated that they used the GRET in 2020 for sales illustration purposes. The range was from 11% for Direct Marketing to 43% for Independent. Based on the information received over the last several years, the variation in GRET usage appears to be in large part due to the relatively small sample size and different responders to the surveys.

We hope LATF finds this information helpful and sufficient for consideration of a potential update to the GRET. If you require further analysis or have questions, please contact Pete Miller at 847-706-3566.

Kindest personal regards,

Pete Miller, ASA, MAAA

APPENDIX A -- DISTRIBUTION CHANNELS

The following is a description of distribution channels used in the development of recommended 2022 GRET values:

1. **Independent** – Business written by a company that markets its insurance policies through an independent insurance agent or insurance broker not primarily affiliated with any one insurance company. These agencies or agents are not employed by the company and operate without an exclusive distribution contract with the company. These include most PPGA arrangements.

2. **Career** – Business written by a company that markets insurance and investment products through a sales force primarily affiliated with one insurance company. These companies recruit, finance, train, and often house financial professionals who are typically referred to as career agents or multi-line exclusive agents.

3. **Direct Marketing** – Business written by a company that markets its own insurance policies direct to the consumer through methods such as direct mail, print media, broadcast media, telemarketing, retail centers and kiosks, internet or other media. No direct field compensation is involved.

4. **Niche Marketers** – Business written by home service, pre-need, or final expense insurance companies as well as niche-market companies selling small face amount life products through a variety of distribution channels.

5. **Other** – Companies surveyed were only provided with the four options described above. Nonetheless since there were many companies for which we did not receive a response (or whose response in past years’ surveys confirmed an “other” categorization (see below), values for the “other” category are given in the tables in this memo. It was also included to indicate how many life insurance companies with no response (to this survey and prior surveys) and to indicate whether their exclusion has introduced a bias into the resulting values.
APPENDIX B – UNIT EXPENSE SEEDS

The expense seeds used in the 2014 and prior GRETs were differentiated between branch office and all other categories, due to the results of a relatively old study that had indicated that branch office acquisition cost expressed on a per Face Amount basis was about double that of other distribution channels. Due to the elimination of the branch office category in the 2015 GRET, non-differentiated unit expense seeds have been used in the current and immediately prior studies.

The unit expense seeds used in the 2022 GRET and the 2021 GRET recommendations were based on the average of the 2006 through 2010 Annual SOA expense studies. These studies differentiated unit expenses by type of individual life insurance policy (term and permanent coverages). As neither the GRET nor the Annual Statement data provided differentiates between these two types of coverage, the unit expense seed was derived by judgment based this information. The following shows the averages derived from the Annual SOA studies and the seeds used in this study. Beginning with the 2020 Annual Statement submission this information will become more readily available.

Update on the Transition from LIBOR

Pat Allison, FSA, MAAA
August 12, 2021

Agenda

- Background
- Key Dates
- Company Actions Needed
- Applicable Valuation Manual Language
- Future LATF Actions Needed
Background

- LIBOR is a widely used benchmark for short-term interest rates. Approximately $200 trillion of financial contracts reference USD LIBOR.

- USD LIBOR is currently published for 7 tenors (overnight, 1-week, 1-month, 2-month, 3-month, 6-month, and 12-months), but this will be ceasing.

- The 3-month and 6-month USD LIBOR tenors are specifically cited in the Valuation Manual.

- The Alternative Reference Rates Committee (ARRC) is a group of private-market participants formed in 2014 by the Federal Reserve Board and the NY Fed. It seeks to ensure a successful transition from USD LIBOR to its recommended alternative, the Secured Overnight Financing Rate (SOFR).

Background (continued)

Some cited advantages of SOFR*:

- As an overnight secured rate, SOFR better reflects the way financial institutions fund themselves today.

- SOFR is fully based on actual transactions and does not rely on judgment.

- SOFR references multiple segments of the US Treasury repurchase agreement market. The transactions underlying SOFR regularly are around $1 trillion in daily volumes. This protects against the risk of manipulation.

- SOFR's underlying market is resilient and robust.

- SOFR is a true “risk-free” rate suitable as a reflection of interest rates overall.

- SOFR is produced by the public sector using a transparent methodology.

<tbody>
<tr>
<td>7/26/21</td>
<td>Interdealer trading conventions changed to trade SOFR linear swaps in place of USD LIBOR.</td>
</tr>
<tr>
<td>7/29/21</td>
<td>The ARRC formally recommended CME Group’s forward-looking SOFR Term Rates. CME Term SOFR rates are now published daily in 1-month, 3-month, and 6-month tenors.</td>
</tr>
<tr>
<td>1/1/22</td>
<td>1-week and 2-month USD LIBOR will no longer be published (the Valuation Manual does not reference these).</td>
</tr>
<tr>
<td>7/1/23</td>
<td>All other USD LIBOR tenors (i.e. overnight, 1-, 3-, 6-, and 12-month) will no longer be published.</td>
</tr>
</tbody>
</table>

Company Actions Needed

- Insurance companies will need to take inventory of existing products and processes that use LIBOR, which may include:
  - Investments (e.g., floating rate debt, where the interest rate is reset periodically based on LIBOR; derivatives linked to LIBOR)
  - Contracts with policyholders (e.g., annuities with credited rate equal to LIBOR plus a margin)
  - Reinsurance treaties
  - IT feeds
- Take action where required to move toward SOFR or another rate (e.g. for annuity contracts with policyholders, file for approval with the IIPRC and notify owner)
Applicable Valuation Manual Language

  Interest rate swap spreads over Treasuries shall be prescribed by the NAIC for use throughout the cash-flow model wherever appropriate for transactions and operations including, but not limited to, purchase, sale, settlement, cash flows of derivative positions and reset of floating rate investments. A current and long term swap spread curve shall be prescribed for year one and years four and after, respectively, with yearly grading in between. The three-month and six-month points on the swap spread curves shall be the market-observable values for these tenors. Currently, this shall be the corresponding London Interbank Offered Rate (LIBOR) spreads over Treasuries. **When the NAIC determines LIBOR is no longer effective, the NAIC shall recommend a replacement to the Life Actuarial (A) Task Force which shall be effective upon adoption by the Task Force.**

  Note: The bolded language above accommodates a single replacement for LIBOR (e.g., SOFR).

Applicable Valuation Manual Language (continued)

- VM-20 Appendix 2, Sections G.1-3 relating to Long-Term Benchmark Swap Spreads

  1. **Extract daily swap spread data over the prescribed observation period (rolling 15-year period)** ending on the last business day of the quarter. For Bank of America data, convert the daily swap rate for each maturity to a swap spread by subtracting the corresponding maturity Treasury yield from the swap rate. For JP Morgan, the daily swap spread is provided for each maturity.

  2. Average the daily Bank of America swap spread data with the daily JP Morgan swap spread data by maturity over the prescribed observation (rolling 15-year period).

  3. Calculate the 85% conditional mean for each of the 32 maturity categories (three-month, six-month, one-year, two-year, ... 30-year) using the same business trading days as were used in the 85% conditional mean for long-term bonds spreads.

  Note: We will not have 15 years of data for LIBOR’s replacement.
Future LATF Actions Needed

- Identify the replacement for LIBOR.
  - The ARRC has recommended SOFR as LIBOR’s replacement, but there are competing alternatives (e.g. Bloomberg’s Short-Term Bank Yield Index).
- Adopt the replacement for LIBOR when the NAIC determines that LIBOR is no longer effective. This will enable the NAIC to begin publishing the 3-month and 6-month rates.
- Amend the *Valuation Manual* to specifically identify the replacement for 3-month and 6-month USD LIBOR.
- Determine whether the process for calculating Long-Term Benchmark Swap Spreads needs to be changed, given that there is no 15-year history for LIBOR’s replacement.

Questions?
Update on Mortality Experience Data Collection

Pat Allison, FSA, MAAA
Angela McNabb, ASA, MAAA
August 12, 2021

Agenda

• Data Collection Timeline
• Project Status
• Early Observations
• Resources Available on the NAIC Website
## 2021 Experience Data Collection Timeline

<tr>
<td>5/27/21</td>
<td>NAIC finished hosting a series of company training webinars.</td>
</tr>
<tr>
<td>6/7/21</td>
<td>NAIC notified companies that they could begin submitting data for the 2018 and 2019 observation years.</td>
</tr>
<tr>
<td>9/30/21</td>
<td>Deadline to submit data using the Regulatory Data Collection (RDC) tool. Automatic feedback on form and format data exceptions will be provided by RDC upon submission. Additional feedback will be provided within 30 days based on actuarial review.</td>
</tr>
<tr>
<td>12/31/21</td>
<td>Deadline for companies to make corrections</td>
</tr>
<tr>
<td>5/31/22</td>
<td>NAIC to submit aggregate experience data to SOA</td>
</tr>
</tbody>
</table>

## Project Status

- As of 8/2/2021, 115 companies, representing 90% of industry claims, are subject to the Mortality Experience Data Collection. Of these companies:
  - 85 have participated in either the KS or NY mortality experience data calls
  - 77 are subject to Life PBR
- The NAIC has received 3 full submissions and 1 partial submission
Early Observations

- Training sessions were very well attended (recordings and slides are available on the NAIC website).
- Companies have been actively communicating with the NAIC regarding out-of-scope business, exemption requests, and miscellaneous questions.
- Some submissions have been incomplete. They need to include data for the 2018 and 2019 observation years, VM-51 questionnaires, control totals, and a reconciliation.
- A communication was sent to companies regarding common questions and issues.

Resources

The following resources are on the NAIC website

Group Life COVID-19 Mortality Survey

Survey Overview

• Purpose is to gather high-level view of U.S. Group Term Life Insurance mortality results during the COVID-19 pandemic
• 20 of the top 21 U.S. Group Term Life insurers focused on employer groups participated in the survey (about 90% of industry)
  • Includes over 1.8 million claims and over $83 billion in earned premium
• Survey compares mortality results during pandemic to 2017-2019 baseline period
• July report contains data through Q1 2021 and is an update to the December 2020 report, which included data through August 2020
Survey Highlights

• Group Life claim incidence were higher for the April 2020 – March 2021 period:
  • 17.3% on Reported basis
  • 19.6% on Incurred basis
• 13% of reported claims from April 2020 – March 2021 had a cause of death of COVID-19
• Blue Collar group experienced the smallest excess mortality of the collar groups studied
  • Spread between Blue and White/Grey has narrowed since the previous update

Survey Highlights

• Mortality patterns by region changed over the course of the pandemic.
  Regions with highest excess mortality by quarter:
  • Q2 2020: Northeast (42.6%)
  • Q3 2020: Southeast (25.3%)
  • Q4 2020: Midwest (33.8%)
  • Q1 2021: Southeast (32.3%)
• Group Life survey data excess mortality was generally 80% - 110% of U.S. population data
  • December report indicated a 50% - 70% range
  • West region showed the largest spread between Group Life and U.S. population data
Individual Life COVID-19 Claims Analysis

Overview and Data

• The previous report published in March included data from 2015 – June, 2020
  • Analysis was by cause of death, but not a true experience study
• This experience study included data from 2015 – September, 2020
  • 2020 deaths compared with 2015 – 2019, by quarter
  • The data included exposures: this is similar to a more traditional experience study than the March study
  • Results largely in line with COVID-19 experience from other studies, with some interesting observations
• 31 Contributing companies with 2.8 million deaths
Methodology

• Generally follows a standard Actual to Expected study, but:
  • The baseline is based on VBT-2015, which is an amount-based table
  • When analyzed based on amount, even with 2.8 million deaths, ratios were very volatile
  • Numerators based on counts, which gave stable, solid results
  • Report discusses “relative mortality ratios” instead of “Actual to Expected” because of this technical disconnect

Methodology Contd.

• 2015 – 2019 experience was extrapolated to 2020 by quarter, and compared against 2020 actuals
• Overall 5-year trends were clearly identifiable
Methodology Contd.

• The results were also shown as excess mortality charts, by quarter:

![Excess Mortality Charts](chart.png)

All fully underwritten business, by quarter

Actual to Expected Relative Mortality Ratios: By Sex and Attained Age

![Actual to Expected Mortality Ratios](chart2.png)
Actual to Expected Relative Mortality Ratios: By Preferred Class

US Population Mortality

2020 Overall U.S. Population Historical Mortality Rates

- 2020 Mortality Rate = 830.5/100,000 (0.8%)
- 83.6 deaths/100,000 due to COVID
- ★16.1% increase over 2019
- ★2020 highest rate since 2003
- ★Without COVID, increase over 2019 = 4.4%

CDC WONDER; CDC Rapid Release.
Actual/Expected (A/E) in 2020 U.S. Population

- Compares actual deaths to an expected baseline
- Actual/Expected or A/E's
- Differs from CDC analysis – by sex and age group

★ Ages <5 had lower mortality than expected
★ Ages 35-54 highest A/Es for all CODs
★ Ages 15-24 had highest A/Es if COVID excluded

### Ethical and Responsible Use of Data and Predictive Models Certificate Program

- Session runs October 2021 – February 2022
- Self-directed E-learning & virtual instructor-led sessions
- Participant discussion community
- Seven modules with self-tests
- Final ‘take home’ assessment for certificate

Register at SOA.org/ERUcert
Life Practice Council Update

Laura Hanson, MAAA, FSA
Vice President

Agenda

- Webinars and Events
- Recent Activities
- Ongoing Efforts
- Academy Officer Candidates
Webinars and Events

- Recent
  - The Impacts of COVID-19 on the Life Insurance Industry (May 25)
  - Spring 2021 Life Policy Update (May 5)
  - Virtual PBR Boot Camp (June 7-9)

Webinars and Events (continued)

- Upcoming
  - Summer 2021 Life Policy Update (August-TBD)
  - PBR Regulatory Webinar (September-TBD)
  - Academy Annual Meeting and Public Policy Forum (November 4-5)
Recent Activities

- Submitted draft VM-22 Framework
- Published annual FAQ on the Academy Interest Rate Generator in conjunction with the Society of Actuaries
- Submitted comments to the NAIC on:
  - Various Amendment Proposal Forms (LATF)
  - C-1 bond factors and C-2 longevity factors (Life Risk-Based Capital [LRBC] Working Group)
  - Exposed 2021 committee charges (Special Committee on Race and Insurance)

Ongoing Activities

- Provide input on Economic Scenario Generator transition
- Develop VM-22 and C-3 field study for non-variable annuities
- Publish VM-21 Practice Note Addendum
- Provide commentary on mortality improvement discussions
- Recommend C-2 mortality factors
Ongoing Activities (continued)

- Propose VM-51 data elements
- Publish Life Illustrations Practice Note Addendum
- Publish FAQs on changes to tax reserve calculations and reporting under the federal Tax Cuts and Jobs Act

Ongoing Activities (continued)

- Provide public policy analysis on:
  - The use of annuities in retirement plans, including changes as a result of the federal SECURE* Act
  - The use of data and algorithms in risk classification and underwriting
  - Efforts to promote diversity and inclusion in the actuarial profession and in life insurance products

* Setting Every Community Up for Retirement Enhancement
Academy Officer Candidates

- Slate of Incoming Vice Presidents*
  - Ben Slutsker, Life
  - Seong-min Eom, Risk Management and Financial Reporting

* Academy vice presidents serve two-year terms. Per the Academy’s bylaws, the officer slate will be voted on by the Board at its annual meeting in October. Terms for all new Board members will begin in November at the completion of the Academy’s Annual Meeting.

Thank You

Filing Health Care Claims Document (Attachment Two-E) .............................................................................................. 7-20
Medical Necessity Document (Attachment Two-F) ........................................................................................................... 7-21
Health Innovations (B) Working Group July 27, 2021, Minutes (Attachment Three) ....................................................... 7-23
The Health Insurance and Managed Care (B) Committee met in Columbus, OH, Aug. 16, 2021. The following Committee members participated: Jon Godfread, Chair (ND); Jessica K. Altman, Vice Chair (PA); Lori K. Wing-Heier (AK); Michael Conway (CO); Dean L. Cameron (ID); Kathleen A. Birrane (MD); Anita G. Fox (MI); Grace Arnold (MN); Russell Toal (NM); Glen Mulready (OK); Andrew R. Stolli (OR); Jonathan T. Pike (UT); Mike Kreidler (WA); and James A. Dodrill represented by Ellen Potter (WV). Also participating were: Alan McClain (AR); David Altmaier (FL); Doug Ommen (IA); Mike Chaney (MS); Troy Downing (MT); Eric Dunning (NE); Barbara D. Richardson (NV); Elizabeth Kelleher Dwyer (RI); Carter Lawrence (TN); Doug Slape (TX); Don Beatty (VA); and Tregenza A. Roach (VI).

1. **Adopted its June 22 and Spring National Meeting Minutes**

The Committee met June 22 to adopt the [State] Pharmacy Benefit Manager Licensure and Regulation Model Act (PBM Model).

Director Cameron made a motion, seconded by Commissioner Mulready, to adopt the Committee’s June 22 (Attachment One) and April 12 (see *NAIC Proceedings – Spring 2021, Health Insurance and Managed Care (B) Committee*) minutes. The motion passed unanimously.

2. **Adopted its Subgroup, Working Group, and Task Force Reports**

Commissioner Pike made a motion, seconded by Commissioner Kreidler, to adopt the following reports: 1) the Consumer Information (B) Subgroup, including its July 1 minutes (Attachment Two) minutes; 2) the Health Innovations (B) Working Group, including its July 27 minutes (Attachment Three); and 3) the Senior Issues (B) Task Force.

3. **Heard a Discussion from the Biden Administration on the Implementation and Enforcement of the NSA Provider Requirements**

Jeff Wu (Center for Consumer Information and Insurance Oversight—CCIIO) discussed the Biden Administration’s current and future efforts related to the implementation and enforcement of the federal No Surprises Act (NSA) provider requirements. He focused his remarks on how the federal agencies charged with implementing the NSA can work together to address any implementation and enforcement issues. He said the CCIIO recognizes that the states are in different positions as far as enforcement when the NSA becomes effective Jan. 1, 2022.

Mr. Wu discussed the major provisions in the interim final rule (IFR) issued July 1 with an effective date of Sept. 13. The IFR was issued jointly by the U.S. Department of Labor (DOL), the U.S. Department of Health and Human Services (HHS), the U.S. Department of the Treasury (Treasury Department), and the U.S. Office of Personnel Management (OPM). He said the IFR focused on the NSA’s consumer protection provisions, such as calculating patient cost-sharing, outlining notice and consent waiver provisions, and establishing a consolidated complaints process.

Mr. Wu said the states have primary enforcement authority with respect to insured plans, including the provider provisions. He said the federal Centers for Medicare & Medicaid Services (CMS) will only enforce these provisions if a state does not or cannot substantially enforce them. However, he explained that even under those circumstances, the CMS would seek to enter into a collaborative enforcement agreement with the state. He said the CMS has sent each state a written survey in its effort to assess which states plan to enforce the NSA’s provisions and their ability to do so. He said following the survey response deadline, the CMS plans to hold meetings with each state concerning their survey responses, including which state agency will enforce the NSA provisions, particularly provisions in the NSA concerning providers. Following these conversations, he said the CMS will send a final determination letter to the state’s governor outlining an NSA enforcement scheme.

Director Cameron asked if the CMS plans to send a copy of the letter sent to state governors to state insurance regulators. Mr. Wu confirmed the CMS’s intention to do so. Director Cameron asked for additional clarification on the collaborative enforcement agreements. Mr. Wu said each such agreement would be specific and tailored to a state’s circumstances as to the role the CMS will take, given that the states are the primary enforcers. However, he noted that the CMS recognizes that the
NSA includes a different set of stakeholders, which generally are not subject to state insurance regulation and over which state insurance regulators have no enforcement authority. He said the CMS also recognizes that some states may have resource issues that could affect their direct enforcement capacities. He said given this, there will most likely be different approaches and different collaborative models. He emphasized that the CMS prefers that the states be the primary enforcers of the NSA requirements.

Commissioner Altman asked about the CMS’s plans to educate the consumers and providers on the NSA’s provisions and the possibility of partnering with the states on such education campaigns. Mr. Wu said the CMS is currently thinking about ways to educate stakeholders on the NSA’s provisions. He said the CMS would be very interested in partnering with states in NSA awareness education campaigns. He said he believes that given the nature of the NSA, engaging consumers in such campaigns may be more challenging because consumers most likely will not be paying attention until they need to pay attention, such as after receiving a surprise bill. Commissioner Conway said Colorado has an existing comprehensive state law on surprise bills. He said he is concerned about aligning Colorado’s law and the NSA with respect to enforcement and Employee Retirement Income Security Act of 1974 (ERISA) plans. He asked if the CMS has contemplated or is contemplating the use of collaborative enforcement agreements with the states to address this issue. He said this issue is complex, particularly with respect to self-insured ERISA plans. He said the CMS anticipates additional federal rulemaking to address these types of jurisdictional issues, but the CMS wants to work with the states.

Commissioner Godfried also noted similar complexities regarding enforcement related to air ambulances and the interplay of the NSA and the Airline Deregulation Act (ADA). Mr. Wu agreed. He said the CMS is hoping to address this in future federal rulemaking.

Mr. Wu said the public comment deadline on the IFR ends Sept. 7. He said the federal agencies charged with implementing the NSA plan to issue additional federal rules on the independent dispute resolution (IDR) process. He said he believes that the IDR process in the IFR tries to strike the right balance, but the CMS is certainly aware of trying not to have an overly burdensome and costly administrative process. He said additional federal rulemaking will concern: 1) air ambulance services; 2) direct and indirect compensation to agents and brokers; 3) accuracy of provider directories; and 4) gag clauses.

Heard a Panel Discussion of NSA Provider Compliance and Enforcement Issues

Molly Smith (American Hospital Association—AHA) presented on “No Surprises Act: Provider Compliance and Enforcement Issues.” She said hospitals and health systems strongly support patient protections against surprise medical bills, and they will work diligently to comply with the NSA as of its Jan. 1, 2022, effective date. However, she noted that the NSA is a large comprehensive piece of legislation with several different independent policies. Given this, stakeholders will need time to implement its various components and need adequate and comprehensive guidance from both federal and state governments to assist in this effort. Ms. Smith said oversight will be critical; but, to date, the role of the federal government and the states remains unclear on several key NSA provisions. She discussed the AHA’s primary NSA implementation issues, including issues related to: 1) its scope and application; 2) notice/consent and disclosure documents and policies; and 3) training. She also discussed what the AHA believes are priority areas for oversight and enforcement for both providers and plans and insurers. She discussed from a provider perspective specific NSA oversight and enforcement challenges, such as the complexity of the rules and timeline and standards for implementation. She made several recommendations for Committee members to consider moving forward with NSA implementation, including: 1) clear articulation of which components of the NSA will be overseen by the federal government and which by the states; 2) development of a crosswalk between the federal and state laws and clear assessment of which states meet the standards for compliance on relevant provisions; and 3) development of a data submission process with standards for the states to report complaints and outcomes to the federal government for tracking and oversight.

Emily Carroll (American Medical Association—AMA) discussed the challenges and opportunities the NSA provides from the AMA’s perspective. She highlighted potential issues with the IDR process, including its timelines. In addition, like Ms. Smith’s comments, Ms. Carroll also discussed and urged more clarity on: 1) the scope of federal law and the interaction between federal and state laws; and 2) which laws apply for patients and providers. With respect to the NSA’s notice and consent and disclosure requirements, she urged federal and state insurance regulators to ensure that meaningful information is provided to consumers and noted the need for standard automated transactions. Ms. Carroll also discussed NSA enforcement.

Melanie de Leon (Federation of State Medical Boards—FSMB) presented on “The No Surprises Act: A Process for Collaboration in Compliance.” She described the FSMB, including its role and functions, which is to support state medical boards through education, assessment, research, and advocacy as well as promoting regulator best practices across the states. She discussed how the NSA presents an opportunity for collaboration between stakeholders in complying with its requirements. In focusing on this, Ms. de Leon highlighted Washington’s balance billing law. She discussed how Washington is enforcing its
law with a goal of giving providers and facilities a chance to correct or cure any violations. She also discussed how the Washington Department of Insurance (DOI) has established a partnership with state agencies with provider oversight to share information regarding any violations of the Washington law. The Washington DOI has signed a memorandum of understanding (MOU) regarding data sharing to assist in this partnership effort. Ms. de Leon noted that, to date, the Washington DOI has not received any complaints involving provider violations.

5. Received an Update on the Special (EX) Committee on Race and Insurance Workstream Five’s Work

Commissioner Altman, co-chair of the Special (EX) Committee on Race and Insurance Workstream Five, provided an update to the Committee on Workstream Five’s work to date. She said since the Workstream last updated the Committee at the Spring National Meeting, the Workstream met July 8 and June 10. She said during its June 10 meeting, the Workstream heard responses from a panel of industry representatives and a panel of consumer representatives on several key questions related to data collection. Those questions asked about the benefits of insurer collection of disaggregated demographic data, the risks of collecting such data and regulatory barriers to the collection of such data. She said the Workstream also asked the panelists to discuss what role state insurance regulators should have in collecting this type of data and whether there is a specific deliverable the NAIC should work towards in addressing this issue.

Commissioner Altman said Workstream Five’s July 8 meeting focused on issues related to provider networks, provider directories, and cultural competency. The Workstream asked panelists representing consumers, industry, and providers to respond to several key questions related to these issues, including: 1) whether there are ways state insurance regulators can incentivize more diverse, inclusive, and culturally competent provider networks; and 2) how provider directories can be used as a tool to connect patients to culturally competent providers. The Workstream also asked if there are specific deliverables the NAIC should work towards to address these issues.

Commissioner Altman said following these meetings, the Workstream prepared and distributed a draft data collection best practices document reflecting the discussion during the June 10 meeting for a public comment period ending Aug. 19. She said the Workstream plans to discuss any comments on the draft document during its Aug. 26 meeting.

Commissioner Altman said in looking ahead, the Workstream plans to continue meeting at least once a month to work on best practices documents and collect additional information on issues it identified in its report to the Special (EX) Committee on Race and Insurance. She said the Workstream anticipates finishing work on the data collection best practices document before the Fall National Meeting; and sometime in the Fall, the Workstream plans to begin work on a similar best practices document on provider network, provider directory, and cultural competency issues. She said during its November meeting, the Workstream plans to focus on health equity and COVID-19.

Having no further business, the Health Insurance and Managed Care (B) Committee adjourned.
1. **Adopted Revised Regulatory Framework (B) Task Force Charges**

Commissioner Godfread said that during its June 15 meeting, the Regulatory Framework (B) Task Force adopted a new 2021 charge for the Pharmacy Benefit Manager Regulatory Issues (B) Subgroup to develop a white paper. He said the proposed charge was included in the Committee’s meeting materials. He asked if anyone had any questions about the charge. There were no questions.

Superintendent Toal made a motion, seconded by Commissioner Conway, to adopt the Regulatory Framework (B) Task Force’s revised 2021 charges, adding a new charge for the Pharmacy Benefit Manager Regulatory Issues (B) Subgroup to develop a white paper. The motion passed unanimously.

2. **Adopted the PBM Model**

Commissioner Godfread said that during the Committee’s meeting at the Spring National Meeting, the Committee deferred adoption of the proposed [State] Pharmacy Benefit Manager Licensure and Regulation Model Act (PBM model) in order to have more time to discuss it, particularly to discuss concerns expressed about the proposed drafting note for Section 8—Regulations. He explained that the proposed drafting note provides options to the states to add additional provisions to the pharmacy benefit manager (PBM) model regarding certain pharmacy benefit manager (PBM) business practices.

Commissioner Godfread explained his thoughts regarding the proposed PBM model and whether state departments of insurance (DOIs) are the appropriate state agency to regulate PBMs. He said North Dakota has such concerns, but North Dakota also recognizes that some states may have different thoughts on the issue. He requested comments. Commissioner Birrane acknowledged Commissioner Godfread’s concerns, but she noted that Maryland has enacted extensive legislation related to PBMs and that her concerns with the proposed PBM model related to the proposed Section 8 drafting note. She expressed concern about the approach taken in the drafting note and its impact on the uniform adoption of the PBM model, which is a key goal of NAIC models. Commissioner Birrane suggested that because of the newly adopted charge for the Pharmacy Benefit Manager Regulatory Issues (B) Subgroup to develop a white paper that would explore the PBM business practices in the drafting note, including current and emerging state laws on these practices, the white paper would be the better approach to take rather than the drafting note.

Commissioner Conway also acknowledged Commissioner Godfread’s comments on whether state DOIs are the appropriate state agency to regulate PBMs. He noted, however, that many states have already moved forward with having the state DOI be responsible for regulating PBMs. He also explained that in discussing the proposed PBM model with other NAIC members, some members expressed support for moving forward with a NAIC model regulating PBMs in order to have an NAIC model to support their ongoing efforts on this issue. Commissioner Conway noted Commissioner Birrane’s comments regarding the Section 8 drafting note and its possible deletion, particularly given the adoption of the white paper charge.

Commissioner Conway made a motion, seconded by Commissioner Birrane, to adopt the PBM model without the Section 8 drafting note. Commissioner Godfread asked if there was any discussion.

Carl Schmid (HIV+Hepatitis Policy Institute) said the NAIC consumer representatives submitted a comment letter to the Committee expressing support for adoption of the white paper charge for the Pharmacy Benefit Manager Regulatory Issues (B) Subgroup and support for adoption of the PBM model. He said the NAIC consumer representatives support moving forward.
with the PBM model with the Section 8 drafting note because it provides examples to those states that would like to move beyond PBM licensure or registration to include other provisions regulating PBM business practices. He acknowledged the concerns that some have raised related to the Section 8 drafting note and reiterated the NAIC consumer representatives’ support for moving forward with the PBM model.

The Committee discussed the background related to the Section 8 drafting note, including noting that the drafting note was a compromise between those states that wanted to add substantive provisions to the PBM model concerning some of these PBM business practices and those states that did not want to move beyond PBM licensure and registration. The Committee also discussed the importance of moving forward with the PBM model because it does set out structure for PBM licensure and registration for those states that wish to move forward with having that authority in the state DOI. The Committee also noted the importance of the work the Pharmacy Benefit Manager Regulatory Issues (B) Subgroup will be doing in support of the PBM model with respect to the development of the white paper.

The motion to adopt the PBM model without the Section 8 drafting note (Attachment One-A) passed based on those Committee members present and voting.

Having no further business, the Health Insurance and Managed Care (B) Committee adjourned.

[STATE] PHARMACY BENEFIT MANAGER LICENSURE AND REGULATION MODEL ACT

Table of Contents

Section 1. Short Title
Section 2. Purpose
Section 3. Definitions
Section 4. Applicability
Section 5. Licensing Requirement
Section 6. Gag Clauses and Other Pharmacy Benefit Manager Prohibited Practices
Section 7. Enforcement
Section 8. Regulations
Section 9. Severability
Section 10. Effective Date

Section 1. Short Title

This Act shall be known and may be cited as the [State] Pharmacy Benefit Manager Licensure and Regulation Act.

Section 2. Purpose

A. This Act establishes the standards and criteria for the licensure and regulation of pharmacy benefit managers providing claims processing services or other prescription drug or device services for health benefit plans.

B. The purpose of this Act is to:

1. Promote, preserve, and protect the public health, safety and welfare through effective regulation and licensure of pharmacy benefit managers;

2. Promote the solvency of the commercial health insurance industry, the regulation of which is reserved to the states by the McCarran-Ferguson Act (15 U.S.C. §§ 1011 – 1015), as well as provide for consumer savings, and fairness in prescription drug benefits;

3. Provide for powers and duties of the commissioner; and

4. Prescribe penalties and fines for violations of this Act.

Section 3. Definitions

For purposes of this Act:

A. “Claims processing services” means the administrative services performed in connection with the processing and adjudicating of claims relating to pharmacist services that include:

1. Receiving payments for pharmacist services;

2. Making payments to pharmacists or pharmacies for pharmacist services; or

3. Both paragraphs (1) and (2).
B. “Commissioner” means the insurance commissioner of this state.

**Drafting Note:** Use the title of the chief insurance regulatory official wherever the term “commissioner” appears.

C. “Covered person” means a member, policyholder, subscriber, enrollee, beneficiary, dependent or other individual participating in a health benefit plan.

D. “Health benefit plan” means a policy, contract, certificate or agreement entered into, offered or issued by a health carrier to provide, deliver, arrange for, pay for or reimburse any of the costs of [physical, mental or behavioral] health care services.

E. “Health carrier” means an entity subject to the insurance laws and regulations of this state, or subject to the jurisdiction of the commissioner, that contracts or offers to contract or enters into an agreement to provide, deliver, arrange for, pay for or reimburse any of the costs of health care services, including a sickness and accident insurance company, a health insurance company, a health maintenance organization, a hospital and health service corporation, or any other entity providing a plan of health insurance, health benefits, or health care services.

**Drafting Note:** States that license health maintenance organizations pursuant to statutes other than the insurance statutes and regulations, such as the public health laws, will want to reference the applicable statutes instead of, or in addition to, the insurance laws and regulations.

F. “Other prescription drug or device services” means services other than claims processing services, provided directly or indirectly, whether in connection with or separate from claims processing services, including, but not limited to:

1. Negotiating rebates, discounts or other financial incentives and arrangements with drug companies;
2. Disbursing or distributing rebates;
3. Managing or participating in incentive programs or arrangements for pharmacist services;
4. Negotiating or entering into contractual arrangements with pharmacists or pharmacies, or both;
5. Developing and maintaining formularies;
6. Designing prescription benefit programs; or
7. Advertising or promoting services.

G. “Pharmacist” means an individual licensed as a pharmacist by the [state] Board of Pharmacy.

H. “Pharmacist services” means products, goods, and services or any combination of products, goods and services, provided as a part of the practice of pharmacy.

I. “Pharmacy” means the place licensed by the [state] Board of Pharmacy in which drugs, chemicals, medicines, prescriptions and poisons are compounded, dispensed or sold at retail.

J. (1) “Pharmacy benefit manager” means a person, business or entity, including a wholly or partially owned or controlled subsidiary of a pharmacy benefit manager, that provides claims processing services or other prescription drug or device services, or both, to covered persons who are residents of this state, for health benefit plans.

(2) “Pharmacy benefit manager” does not include:
(a) A health care facility licensed in this state;

(b) A health care professional licensed in this state;

(c) A consultant who only provides advice as to the selection or performance of a pharmacy benefit manager; or

(d) A health carrier to the extent that it performs any claims processing and other prescription drug or device services exclusively for its enrollees.

Section 4. Applicability

A. This Act shall apply to a contract or health benefit plan issued, renewed, recredentialed, amended or extended on or after the effective date of this Act, including any health carrier that performs claims processing or other prescription drug or device services through a third party.

Drafting Note: States may want to consider adding language to Subsection A above or Section 10—Effective Date providing additional time for pharmacy benefit managers to come into compliance with the requirements of this Act.

B. As a condition of licensure, any contract in existence on the date the pharmacy benefit manager receives its license to do business in this state shall comply with the requirements of this Act.

C. Nothing in this Act is intended or shall be construed to conflict with existing relevant federal law.

Section 5. Licensing Requirement

A. A person may not establish or operate as a pharmacy benefit manager in this state for health benefit plans without first obtaining a license from the commissioner under this Act.

B. The commissioner may adopt regulations establishing the licensing application, financial and reporting requirements for pharmacy benefit managers under this Act.

Drafting Note: States that are restricted in their rulemaking to only what is prescribed in statute may want to consider including in this section specific financial standards required for a person or organization to obtain a license to operate as a pharmacy benefit manager in this state.

C. A person applying for a pharmacy benefit manager license shall submit an application for licensure in the form and manner prescribed by the commissioner.

Drafting Note: States may want to consider reviewing their third party administrator statute if a state wishes to specify what documents must be provided to the commissioner to obtain a pharmacy benefit manager license in the state.

D. A person submitting an application for a pharmacy benefit manager license shall include with the application a non-refundable application fee of $[X].

E. The commissioner may refuse to issue or renew a license if the commissioner determines that the applicant or any individual responsible for the conduct of affairs of the applicant is not competent, trustworthy, financially responsible or of good personal and business reputation or has been found to have violated the insurance laws of this state or any other jurisdiction, or has had an insurance or other certificate of authority or license denied or revoked for cause by any jurisdiction.

F. (1) Unless surrendered, suspended or revoked by the commissioner, a license issued under this section shall remain valid as long as the pharmacy benefit manager continues to do business in this state and remains in compliance with the provisions of this act and any applicable rules and regulations,
including the payment of an annual license renewal fee of $[X] and completion of a renewal application on a form prescribed by the commissioner.

(2) Such renewal fee and application shall be received by the commissioner on or before [x] days prior to the anniversary of the effective date of the pharmacy benefit manager’s initial or most recent license.

Section 6. Gag Clauses and Other Pharmacy Benefit Manager Prohibited Practices

A. In any participation contracts between a pharmacy benefit manager and pharmacists or pharmacies providing prescription drug coverage for health benefit plans, no pharmacy or pharmacist may be prohibited, restricted or penalized in any way from disclosing to any covered person any healthcare information that the pharmacy or pharmacist deems appropriate regarding:

(1) The nature of treatment, risks or alternative thereto;
(2) The availability of alternate therapies, consultations, or tests;
(3) The decision of utilization reviewers or similar persons to authorize or deny services;
(4) The process that is used to authorize or deny healthcare services or benefits; or
(5) Information on financial incentives and structures used by the insurer.

B. A pharmacy benefit manager may not prohibit a pharmacy or pharmacist from discussing information regarding the total cost for pharmacist services for a prescription drug or from selling a more affordable alternative to the covered person if a more affordable alternative is available.

C. A pharmacy benefit manager contract with a participating pharmacist or pharmacy may not prohibit, restrict, or limit disclosure of information to the commissioner, law enforcement or state and federal governmental officials, provided that:

(1) The recipient of the information represents it has the authority, to the extent provided by state or federal law, to maintain proprietary information as confidential; and
(2) Prior to disclosure of information designated as confidential the pharmacist or pharmacy:
   (a) Marks as confidential any document in which the information appears; or
   (b) Requests confidential treatment for any oral communication of the information.

D. A pharmacy benefit manager may not terminate the contract of or penalize a pharmacist or pharmacy due to pharmacist or pharmacy:

(1) Disclosing information about pharmacy benefit manager practices, except for information determined to be a trade secret, as determined by state law or the commissioner; or
(2) Sharing any portion of the pharmacy benefit manager contract with the commissioner pursuant to a complaint or a query regarding whether the contract is in compliance with this Act.

E. (1) A pharmacy benefit manager may not require a covered person purchasing a covered prescription drug to pay an amount greater than the lesser of the covered person’s cost-sharing amount under the terms of the health benefit plan or the amount the covered person would pay for the drug if the covered person were paying the cash price.
Any amount paid by a covered person under paragraph (1) of this subsection shall be attributable toward any deductible or, to the extent consistent with section 2707 of the Public Health Service Act, the annual out-of-pocket maximums under the covered person’s health benefit plan.

Section 7. Enforcement

A. The commissioner shall enforce compliance with the requirements of this Act.

B. (1) The commissioner may examine or audit the books and records of a pharmacy benefit manager providing claims processing services or other prescription drug or device services for a health benefit plan to determine compliance with this Act.

Drafting Note: States may want to consider including a reference to the cost of examinations in the Model Law on Examinations (#390).

Drafting Note: States may want to consider incorporating their existing market conduct examination statutes into this Act rather than relying on the examination authority provided under this section.

(2) The information or data acquired during an examination under paragraph (1) is:

(a) Considered proprietary and confidential;

(b) Not subject to the [Freedom of Information Act] of this state;

(c) Not subject to subpoena; and

(d) Not subject to discovery or admissible in evidence in any private civil action.

C. The commissioner may use any document or information provided pursuant to Section 6C of this Act or Section 6D of this Act in the performance of the commissioner’s duties to determine compliance with this Act.

D. The commissioner may impose a penalty on a pharmacy benefit manager or the health carrier with which it is contracted, or both, for a violation of this Act. The penalty may not exceed [insert appropriate state penalty] per entity for each violation of this Act.

Drafting Note: If an appeals process is not otherwise provided, a state should consider adding such a provision to this section.

Section 8. Regulations

The commissioner may adopt regulations regulating pharmacy benefit managers that are not inconsistent with this Act.

Section 9. Severability

If any provision of this Act, or the application of the provision to any person or circumstance shall be held invalid, the remainder of this Act, and the application of the provision to persons or circumstances other than those to which it is held invalid, shall not be affected.

Section 10. Effective Date

This Act shall be effective [insert date]. A person doing business in this state as a pharmacy benefit manager on or before the effective date of this Act shall have [six (6)] months following [insert date that the Act is effective] to come into compliance with the requirements of this Act.
The Consumer Information (B) Subgroup of the Health Insurance and Managed Care (B) Committee met July 1, 2021. The following Subgroup members participated: Mary Kwei, Chair (MD); Debra Judy, Vice Chair, and Tara Smith (CO); William Rodgers (AL); Randy Pipal (ID); Michelle Baldock, Ryan Gillespie, and Sara Stanberry (IL); Alex Peck and Jennifer Groth (IN); Brenda Johnson (KS); Sherry Ingalls and Judith Watters (ME); Camille Anderson-Weddle, Carrie Couch, Amy Hoyt, Jessica Schrimpf, and Michelle Vickers (MO); Kathy Shortt (NC); Laura Arp and Barbara Peterson (NE); Mike Rhoads and Rebecca Ross (OK); Katie Dzurec, Elizabeth Hart, and Lars Thorne (PA); Gretchen Brodkorb, Candy Holbrook, and Jill Kruger (SD); Heidi Clausen and Tanji J. Northrup (UT); and Jennifer Stegall (WI). Also participating was: Jana Jarret (OH).

1. **Adopted its May 25 and April 1 Minutes**

   The Subgroup met May 25 and April 1. During its May 25 meeting, the Subgroup discussed a plan to complete several short consumer guides on the claims process. During its April 1 meeting, the Subgroup took the following action: 1) discussed potential topics for the Subgroup to address in 2021, such as the federal American Rescue Plan Act (ARPA), the claims process, and the federal No Surprises Act (NSA); and 2) discussed potential products for the Subgroup to develop in 2021, such as a series of briefs on claims, updating the Frequently Asked Questions (FAQ) on Health Care Reform document, and developing new products related to the NSA.

   Mr. Rhoads made a motion, seconded by Ms. Dzurec, to adopt the Subgroup’s May 25 (Attachment Two-A) and April 1 (see NAIC Proceedings – Spring 2021, Health Insurance and Managed Care (B) Committee, Attachment One) minutes. The motion passed unanimously.

2. **Discussed Briefs on the Claims Process**

   Ms. Kwei brought up the draft guides to the claims process: 1) appeals (Attachment Two-B); 2) codes and claims (Attachment Two-C); 3) explanation of benefits (EOBs) (Attachment Two-D); 4) filing health care claims (Attachment Two-E); and 5) medical necessity (Attachment Two-F). She asked members and interested parties to send detailed wording changes by email.

   Ms. Kwei asked for comments on the guide to filing claims. Kris Hathaway (AHIP) said her organization would send detailed wording changes. She also said the claims guide references explanations of benefits, but it did not explain what an EOB is. She suggested linking to the separate guide on EOBs. Harry Ting (Health Care Consumer Advocate) suggested the guide include a recommendation for consumers not to pay a bill from a provider before their health insurer has processed a claim. He also suggested a recommendation for consumers to tell their providers about all insurance plans they are enrolled in to facilitate coordination of benefits.

   Ms. Kwei brought up the guide on understanding EOBs. Mr. Ting said that consumers with more than one insurance plan should expect separate EOBs from each of their plans. Ms. Hathaway questioned whether the guide should reference surprise billing. Ms. Kwei said the group plans a separate guide on surprise billing. Ms. Judy asked about the reference to alternate addresses to send an EOB in case sending one to the policyholder would put an individual in danger. She said the language could also reference confidential services even without a threat of danger.

   Ms. Kwei asked for comments on the guide on understanding claims denials. Ms. Watters said that consumers must receive information on how to appeal in their denial letter, but the sample letter in the draft is a helpful resource for consumers.

   Ms. Kwei brought up the guide on medical necessity. Mr. Ting questioned whether the guide provides more detail than consumers are looking for. Ms. Watters said the content is challenging and hard to make consumer friendly. Ms. Kwei said providers’ offices could use the document in addition to consumers. Bonnie Burns (California Health Advocates—CHA) said the guide should refer consumers to the provisions in their plan documents rather than list complex definitions directly. Ms. Arp clarified the difference between consumer and provider appeals, saying that consumer appeals come with additional rights. She said she approves of the current language. Ms. Dzurec said that it would not be a bad thing if content from the documents overlapped and that complex medical necessity terms could be useful for some consumers. Ms. Jarret and Ms. Kruger said the guide should point out that medical necessity does not guarantee coverage of a service. Brenda J. Cude
(University of Georgia) asked about the difficult language in the medical necessity definition. Ms. Arp said the details are important for some cases and suggested referencing denials based on medical decision-making. Ms. Cude asked whether the language comes from plan language or state law.

Ms. Kwei asked for comments on the guide to claims codes. Ms. Hathaway said AHIP has suggested changes and examples to add in this guide.

Ms. Kwei said the Subgroup has held off on drafting a guide on balance billing while it awaits rules from the federal government under the NSA. She asked whether the Subgroup should continue to wait. Ms. Hathaway said that since rules are expected soon, the Subgroup should wait until its next meeting. Others agreed.

Ms. Kwei asked for comments on the overall structure of the guides. Ms. Judy and Ms. Cude supported the use of a question and answer (Q&A) format. Ms. Kwei asked whether the guides should be formatted or in plain text. Subgroup members said their states would want to add branding, so plain versions are preferred.

The Subgroup agreed to provide further edits within two weeks.

Ms. Shortt said she missed the early part of the meeting and asked about changes to the guide on medical necessity. She said the definitions were taken almost directly from the North Carolina statute. Ms. Kwei said some readers would appreciate more general descriptions, but others will want to know precisely what the statute says. Ms. Watters suggested more general language that then directs readers to each state's laws. The Subgroup discussed whether to use general language with pointers to other sources. Eric Ellsworth (Consumers' Checkbook) said that health insurers should be encouraged to post their definitions of medical necessity on their websites. Ms. Shortt, Ms. Arp, and Ms. Cude agreed to collaborate on updates to the medical necessity guide.

Ms. Kwei said the Subgroup plans to conduct an e-vote on the final documents once edits have been made.

Having no further business, the Consumer Information (B) Subgroup adjourned.
Consumer Information (B) Subgroup
Virtual Meeting
May 25, 2021

The Consumer Information (B) Subgroup of the Health Insurance and Managed Care (B) Committee met May 25, 2021. The following Subgroup members participated: Mary Kwei, Chair, and Paul Meyer (MD); William Rodgers and Anthony L. Williams (AL); Michele Mackenzie, Kathy McGill and Randy Pipal (ID); Michelle Baldock and Ryan Gillespie (IL); Alex Peck (IN); LeAnn Crow, Brenda Johnson and Tate Flott (KS); Judith Watters (ME); Helen Bassett, Galen Benshoof and Candace Gergen (MN); Camille Anderson-Weddle, Carrie Couch, Amy Hoyt, Jessica Schrimpf and Michelle Vickers (MO); Kathy Shortt (NC); Laura Arp and Martin Swanson (NE); Kurt Cagle and Mike Rhoads (OK); Katie Dzurec and Elizabeth Hart (PA); Gretchen Brodkorb, Lisa Harmon and Jill Kruger (SD); David Combs, Bill Huddleston, Jennifer Ramcharan and Vickie Trice (TN); Tanji J. Northrup, Shelley Wiseman and Jaakob Sundberg (UT); and Barbara Belling, Eric Corman, Diane Dambach, Darcy Paskey, Jennifer Stegall, Jody Ullman and Julie Walsh (WI). Also participating was: Jana Jarrett (OH).

1. Discussed Briefs on the Claims Process

Ms. Kwei noted that the Subgroup had finalized its addendum to the Frequent Asked Questions about Health Care Reform (FAQ) document, and she said the Subgroup would return to the FAQ document prior to the beginning of Open Enrollment in the fall. She said the Subgroup would next turn to consumer guides on the claims process, as had been discussed on previous calls.

Ms. Kwei asked for input from Subgroup members and interested parties on how the guides should be written. Bonnie Burns (California Health Advocates—CHA) asked whether the guides would take the form of a FAQ document. Ms. Kwei responded that she is open to suggestions; although, she said she envisioned a series of separate, stand-alone guides that were brief, hopefully 1–2 pages. She mentioned that one of the most popular documents Maryland makes available to consumers is a short one on in- versus out-of-network claims issues, with definitions, explanations and FAQ. Ms. Shortt said North Carolina provides consumers with a six-page toolkit on medical necessity denials that helps consumers through their own appeals. Ms. Jarrett suggested that the documents be thought of as tip sheets or infographics rather than guides. Harry Ting (Healthcare Consumer Advocate) said an existing brochure from Colorado is a useful model for appeals, as well as a sample letter Pennsylvania provides. Eric Ellsworth (Consumers Checkbook) said consumers need examples of what can be challenged through appeals and what cannot.

Ms. Kwei listed the topics that had been proposed and discussed on past calls, including filing claims; understanding explanations of benefits (EOBs); how to appeal a denial; medical necessity; balance billing; and CPT codes. Ms. Burns said the issues with current procedural terminology (CPT) codes should be covered in the guide to denied claims. She noted that individuals covered by Medicare and Medicaid have different issues with appeals, and there are a good deal of existing documents for the Medicare population. She asked whether EOBs are similar enough across insurers and different types of insurance (TOIs) that one guide could help with all of them. Ms. Kwei said EOBs are not standardized, but they all follow a general template. Ms. Dzurec said denial codes may not fully explain the reason a claim was denied; she said medical necessity may be implicated without being mentioned. She said those who appeal should start with the TOI, because the regulatory agency and potential helpers differ. She said after that determination, there is some baseline content that the Subgroup can develop, then work with sister agencies to determine what is helpful for those covered by other TOIs.

Joe Touschner (NAIC) asked whether the guides are intended for enrollees in state-regulated plans or for consumers with any type of coverage. Ms. Kwei said there is often a distinction made between public plans and commercial plans, and commercial plans include self-funded plans and others not regulated by the state. She said the focus should be on the plans states regulate; although, a guide on how to read an EOB should be applicable for non-state regulated plans, as well. Mr. Ting said a guide should have content for any consumer, regardless of their coverage source, even if it does not go into detail. Mr. Ellsworth said consumers want an answer to their question, not to understand how the health care system works. He suggested organizing around a specific situation a consumer is in. He said FAQ can offer smaller bits of information that are easier to read and better able to be formatted on a mobile-friendly web page.

Ms. Kwei asked about existing documents that can serve as models for the guides. Ms. Dzurec said Pennsylvania could share the script for its YouTube videos. The Subgroup discussed the benefits of both digital and paper-based materials.
Ms. Burns said consumers are interested in getting answers to their questions; i.e., what it is, what they are looking at, why it happened, what they can do about it, and where they can get help.

Ms. Shortt explained that North Carolina has a unit that helps consumers file appeals with their insurers, and it provides sample appeal letters, as well as brochures, that explain how to reach the department.

Ms. Watters suggested producing a document that is broad to increase literacy, rather than a specific how-to in constructing an appeal.

Ms. Kwei asked for an individual to take the lead on each of the topics, with others assisting. Subgroup members volunteered for each of the topics, except balance billing. Ms. Kwei suggested that the balance billing guide should wait until more is known about federal regulations under the No Surprises Act. Kris Hathaway (America’s Health Insurance Plans—AHIP) said her organization would soon complete a consumer-facing one-pager on the No Surprises Act and would share it with the Subgroup. Ms. Kwei said each topic should be covered in one to two pages; for some, a graphic may be the best way to explain it.

Ms. Burns asked if in- and out-of-network concepts should be included. Ms. Kwei said those concepts could be included in the other topics.

The Subgroup agreed that draft guides for each topic should be completed by the end of June.

Ms. Hathaway offered to review the guides for consistency with health plan operations.

2. Discussed Other Matters

Ms. Kwei said some questions have been raised regarding how the Subgroup can better reach consumers with its materials. She said the various sources of coverage, different insurance regulators, and variety of consumer situations all create challenges to having general materials. She said the Subgroup generally relies on states to fill in the specifics where they can. She said the Subgroup is open to suggestions on how it can better fulfill its charges, which center around developing resources for state insurance regulators and others who assist consumers.

Mr. Ting said consumer representatives are concerned that many consumers do not look for information online from insurance departments. He said departments should get the information out to consumers, rather than wait for consumers to come to the departments. He suggested a survey to identify best practices among the states. He said some examples are distributing guidance on choosing plans to consumers who disenroll from Medicaid or file unemployment claims. Ms. Arp said search optimization is important to ensure that insurance department materials come up when consumers search for information on claim denials or other issues. Ms. Dzurec suggested working with communications staff to think about how to better optimize for searches and otherwise break down silos between drafters and communications work.

Having no further business, the Consumer Information (B) Subgroup adjourned.
HOW TO APPEAL DENIED CLAIMS

...If Your Health Plan Says “NO”

You have the right to appeal your health plan’s denial of benefits for covered services that you and your health care provider (doctor, hospital, etc.) believe are medically necessary.

There are two kinds of appeals—internal appeal and external review

Things to Keep in Mind

Medicare & Medicaid
If you are enrolled in Medicare or Medicaid, there are different rules for appeals.
- For Medicare, call 1-800-MEDICARE to ask for information on free assistance.
- For Medicaid, contact your state’s Medicaid agency for assistance.

Keep Records
Keep detailed records, including bills from your provider, notices from your health plan, copies of denial letters, appeal requests and medical information related to your case.

Take Detailed Notes & Establish Response Deadlines
Write down the date/time of all calls, names of people with whom you spoke, details of all conversations and any established deadlines for expected responses or information from your insurance company.

Filing an Internal Appeal
By filing an internal appeal, you are requesting your health plan to review the denial decision in a fair and complete way. You have up to six months (180 days) after finding out your claim was denied to file an internal appeal.

⇒ If the denial is for a medical reason, ask your health care provider to contact your health plan to request reconsideration of your claim based on additional information that your provider can supply. If your life, health, or ability to function could be jeopardized, you can request that the appeal be reviewed on an expedited basis.

⇒ Ask your health plan how to file an internal appeal by contacting the customer service number provided on your insurance card/materials, or

⇒ Write a letter to your health plan requesting an internal appeal. Make sure to include your name, claim number, and health insurance ID number. You should include any additional information, such as a letter from your provider, that helps support your claim. (See reverse side for sample letter.)

Upon receiving your request, your health plan has a specific amount of time to review and issue a decision on the internal appeal.

Filing an External Review
If your health plan does not change its decision as a result of the internal appeal, an external review can be requested. An external review is performed by an independent review organization. You must ask for an external appeal within a specific amount of time after receiving the decision of your internal appeal.

⇒ Your internal appeal notice should provide information on requesting an external review.

⇒ Your state’s insurance regulatory agency is usually in charge of the external review process.

⇒ New information can be submitted to support your position.

⇒ The external reviewer will provide you and your health plan with written notice of its decision within a specific amount of time after receiving the review assignment.

⇒ If the external review results in a reversal of your health plan’s decision to deny, the company must approve benefits for the covered services.

If you have questions or think your health plan is doing something wrong, contact your state insurance regulatory agency. A directory of all state insurance regulatory agencies is

When you use medical services, you or your provider file a claim to your health plan. Most of the time, the health plan will pay the claim, either directly to the provider or to you if you have already paid for your medical care.

Sometimes your health plan will say “no” to a claim, if full or in part, for benefits or services you believe should have been covered. Here are the steps you can take....
Health Care Bills: Codes and Claims

Most of the time, your health care provider will submit claims to your health insurance plan for you, and you don’t need to know how information is entered on the claim. However, sometimes you may have to submit a claim yourself, or your plan may deny a claim. When that happens, you will want to know more about claims and the billing codes used on them.

Why would I need to worry about codes?

When you see a provider who does not participate in your health plan’s network, you might have to file a claim with the plan yourself. Filing a claim means asking the plan to pay its portion of the health care provider’s bill. In order to process the claim, your health plan will need to know the proper codes. You will need to get an invoice from your provider that includes the codes to submit with your claim.

Your health plan may also deny a claim. When you contact your health plan, you might be told that the wrong code was used. Knowing how codes are used can help you get your bill paid.

How are codes used on a claim?

Information is entered on claims using codes. These codes are used as a way to describe the service you received. There are diagnosis codes, which may also be called the ICD-10 codes. Diagnosis codes describe the reason that you received treatment. There are procedure codes, which may be called the CPT codes. These codes describe the treatment you received. There are also codes used by facilities and hospitals to describe the services or supplies they provided.

All of these codes make it possible to send the insurance company detailed information in a condensed way. There are standard references that define the codes, often with very specific details. When a code is used, it gives a summary of a detailed diagnosis or service, using a few numbers.

Why would the health plan deny a claim based on the code?

A health plan may deny a claim if the code does not match the services that were performed or the services the plan expected based on the diagnosis. The definitions of codes can be detailed, and if the medical records don’t record each detail of a code definition, the claim may be denied for an incorrect code. There may be another code that describes the services better.

When you see a doctor for what are called evaluation and management services, there are different levels of codes. Most visits to your family physician are evaluation and management services. The doctor asks about your medical history, examines you, and makes a decision about how to treat you. The level of the service depends on how complex these steps are and how long they take. There are five levels of these services. If the doctor’s office bills for a higher level than was provided, the claim may be denied.

There are other reasons that a claim may be denied based on the code that was used. You can call your health plan to ask questions, and also ask the provider’s billing office to check the code. You can also file an appeal of a denied claim.
Health Care Bills: Explanation of Benefits

After your visit to your doctor or another health care provider, you'll receive information about your claim in the form of an Explanation of Benefits, or EOB. The EOB is not a bill. It is an explanation generated as part of the claims process and shows you the payment breakdown for the services received.

**What does the EOB tell me?**

Essentially, the EOB will tell you how much your provider charged, how much the health plan paid, and how much you are responsible for or owe your provider. Your EOB comes from your health plan and is separate from the bill your provider may send. Make sure to compare “owed” amounts listed on the EOB with the bill from your provider’s office or the co-pay you already paid.

**What does the EOB look like?**

This document may be mailed to you or be made available electronically in your member portal.

Not all EOBs look alike, but here are a few things to look for on your EOB:

- Information about the person receiving the services, including the ID number and the member name sometimes identified as “patient” – if it’s your insurance, the EOB will usually include the notation “self” when referring to the patient, if the insurance is through your spouse or your parent, then their name will be included on the EOB;
- A list of the services received, which should include the dates of service and may include billing codes – if the billing codes are not provided on the EOB, there should be notes about how to get the codes if you would like to review them;
• Information about the provider or facility – this may be the name of a specific doctor, nurse practitioner, psychologist, physical therapist, etc., or it may be the name of a laboratory, hospital, or other office;
• The amount billed by the provider or facility;
• The “allowed” amount is the amount the health plan designates for each service – when you go to an in-network provider, the health plan will pay that provider all or a portion of a negotiated rate for the services provided. Do not be surprised if the allowed amount is lower than the provider/facility billed amount;
• The amount the health plan paid for each service.
• Any amount you owe to the provider – this amount may include the copay you paid in the office at the time of your visit;
• Information about denials, additional details, or other notes – you may see codes in line with each service, and the codes should be defined below the table listing the services.

How else is an EOB helpful?

The EOB is also an important tool for tracking how much you have spent on out-of-pocket health care costs. It will tell you how far along you are in meeting your deductible and your out-of-pocket limit for the year. If you’ve reached your out-of-pocket limit and you are asked to pay for services, you should contact your health plan right away.

Finally, your EOB has instructions for filing a grievance or appeal if coverage for your services is denied or only partially covered.

Who receives the EOB?

Usually, the EOB goes to the primary person listed on the health plan documents. If an employer provides the health plan, the employee is usually the person who receives EOBs, including the EOBs for a spouse and dependents. If disclosure of the information on an EOB would place you in danger, you may ask the health plan to send your EOBs to an alternate address.
Health Care Bills: Filing Health Insurance Claims

When you have a medical procedure or visit, you usually pay your health care provider (doctor, hospital, therapist, etc.) a co-pay to cover your portion of the provider’s bill. You expect your health plan to pay the rest of the bill. To ask the health plan to pay its share, the provider will file a claim with your health plan.

However, there are some cases when you might have to file a claim yourself. This could happen when you go to an out-of-network provider, when the provider does not accept your insurance, or when you are traveling.

If you need to file your own health insurance claim, here’s what you need to know:

**How do I file a claim with my health plan?**

Look at your health insurance card for the correct website or phone number to use.

There will likely be a link on the health plan’s website to file a claim. The plan will have a form to complete for filing a claim and information on how to submit the claim. If you cannot find this information on the website, call the number on your insurance card and the customer support representative can inform you how to file a claim.

**What will I need?**

You will need the itemized bill from your health care provider. This will include the date of service, a list of procedures or services completed, and the provider’s charge for each service. It will also include a description of each service or the code for each procedure.

You will also need information such as your social security number, your insurance ID number, your employment status (if the reason for medical care was due to an accident or illness at work), and whether to send payment directly to the provider or to you.

**When do I file the claim?**

File the claim as soon as it is possible after the procedure or service is completed. Many health plans have a time limit for how long you have to file a claim, such as within 90 days of the service.

**Where do I submit the claim?**

While each health plan will inform you where to send the information, often it is to the address on the back of your health insurance card.

**What happens after you file the claim?**

After you file the claim, the health plan has a limited time (it varies per state) to inform you if they have accepted or denied the claim. The company will send you an explanation of benefits. If you selected the payment to be sent directly to you, you will receive the payment and then you will need to pay the provider directly if you have not already done so.
What is medical necessity?

Medical necessity is a term used by health insurance companies to describe the coverage that is offered under a benefit plan. In the policy and benefit summary, the language that informs a person about what is covered under their insurance plan will generally describe benefits that are available “when medically necessary.” So, what does this mean?

How does medical necessity affect coverage for my health care services?

The way your health plan defines medical necessity impacts how it decides which health care services it will pay for. Generally, health plans pay a portion of the bill for covered services that fit the definition of medical necessity.

Health insurance plans will provide a definition of “medical necessity” or “medically necessary services” in the policy. There may also be a definition that is found in state law. The following elements may be included within a definition for “medical necessity.” These are services that are:

• provided for the diagnosis, treatment, cure, or relief of a health condition, illness, injury, or disease; and except for clinical trials that are described within the policy, not for experimental, investigational, or cosmetic purposes;
• necessary for and appropriate to the diagnosis, treatment, cure, or relief of a health condition, illness, injury, disease or its symptoms;
• within the generally accepted standards of medical care in the community; and/or
• not solely for the convenience of the insured, the insured’s family or the provider.

Policy language may also include provisions to consider:

• the cost effectiveness of the requested treatment;
• alternative services or supplies for covered services; and/or
• the setting where medically necessary services are eligible for coverage.

Self-funded plans that are not under state insurance regulatory authority typically hire Third Party Administrators to administer their health benefits. The Summary Plan Description, which describes the covered services and issued to covered employees, may include a definition for medical necessity.

Medicare defines “medically necessary” as health care services or supplies needed to diagnose or treat an illness, injury, condition, disease, or its symptoms and that meet accepted standards of medicine.

Each state may have a definition of “medical necessity” for Medicaid services within their laws or regulations.

How is “medical necessity” determined?

A doctor’s attestation that a service is medically necessary is an important consideration. Your doctor or other provider may be asked to provide a “Letter of Medical Necessity” to your health plan as part of a “certification” or “utilization review” process. This process allows the health plan to review requested medical services to determine whether there is coverage for the requested service. This can be done before, during, or after the treatment.

A “precertification review” is conducted before the treatment has been provided and allows the health plan to decide if the requested treatment satisfies the plan’s requirements for medical necessity. This can be done by reviewing the Letter of Medical Necessity, medical records, and the plan’s medical policies for coverage.

A “concurrent review” occurs during the treatment to decide if the ongoing treatment is medically necessary.

A “retrospective review” occurs after the treatment has been provided to decide if the services were medically necessary, experimental, cosmetic or sometimes whether there was truly a need for emergency services.

What is a medical policy?

Definitions for medical necessity include a requirement that the treatment is within the accepted standards in the medical community. This is defined in the health plan’s medical policy.

A health plan must make its medical policy available to you if it is used to make a decision to deny you coverage.
What about experimental, investigational or cosmetic services?

Some definitions of medical necessity include the requirement that they are “not for experimental, investigational or cosmetic purposes.” Health plans may use their medical policies to determine if a treatment is considered experimental for your condition. This holds true for conditions that can be considered cosmetic but may also have a medical purpose. Medical records may be used to help make medical necessity determinations, but decisions may be based on the available scientific literature as well.

Does medical necessity affect emergency services?

Emergency services may be reviewed retrospectively to see if the care was appropriate to your diagnosis and medically necessary for an emergency level of care. The standard for making this coverage decision is made on the “prudent layperson” standard, which allows that a precertification is not necessary if a prudent layperson would believe that an emergency condition existed and that a delay in treatment would worsen that condition.

W:\National Meetings\2021\Summer\Cmte\B\CnsmrInfoSG\Medical Necessity.docx
The Health Innovations (B) Working Group met July 27, 2021. The following Working Group members participated: Andrew R. Stolfi, Chair, and TK Keen (OR); Laura Arp, Co-Vice Chair (NE); Nathan Houdek and Jennifer Stegall, Co-Vice Chairs, Barbara Belling, Diane Dambach, Darcy Paskey, Jody Ullman, and Richard Wicka (WI); Andria Seip and Cynthia Banks Radke (IA); Stephen Chamblee, Meghann Leaird, and Alex Peck (IN); Craig Van Aalst, Julie Holmes, Vicki Schmidt, and Tate Flott (KS); Sherry Ingalls, Joanne Rawlings-Sekunda, and Mary Hooper (ME); Karen Dennis, and Sarah Wohlford (MI); Carrie Couch, Chlora Lindley-Myers, and Amy Hoyt (MO); Chrystal Bartuska, John Arnold, Angie Voegele and Karri Volk (ND); Lisa Cota-Robles, Michelle Heaton and Maureen Belanger (NH); Philip Gennace (NJ); Paige Duhamel and Viara Ianakieva (NM); Jessica K. Altman and Sandra L. Ykema (PA); Rachel Bowden, Valerie Brown, Blake Davenport, R. Michael Markham, Dylan MacInerney, Monica Pinon, and Barbara Snyder (TX); Heidi Clausen, Shelley Wiseman, Tanji J. Northrup, and Jaakob Sundberg (UT); Jane Beyer and Jennifer Kreitler (WA); and Joylynn Fix (WV).

1. **Adopted March 26 Minutes**

The Working Group met March 26 and took the following action: 1) heard presentations on telehealth policy changes during the COVID-19 pandemic; and 2) discussed changes to state insurance department business practices during the pandemic.

Commissioner Altman made a motion, seconded by Commissioner Schmidt, to adopt the Working Group’s March 26 minutes (see NAIC Proceedings – Spring 2021, Health Insurance and Managed Care (B) Committee, Attachment Two). The motion passed unanimously.

2. **Discussed New Charges from the Special (EX) Committee on Race and Insurance**

Commissioner Stolfi brought up charges for the Working Group recently approved by the Special (EX) Committee on Race and Insurance. He said they focus on two methods that could be used to reduce disparities, including telehealth and alternative payment models. He said they also ask the Working Group to evaluate programs to reduce racial disparities. Commissioner Stolfi said a potential way is to gather information on two questions: 1) Does telehealth reduce disparities by improving access to care?; and 2) Do alternative payment models reduce disparities by improving access to care? He said after evaluating the questions, the Working Group could make recommendations to the Health Insurance and Managed (B) Committee and ultimately the Special (EX) Committee on Race and Insurance.

Commissioner Stolfi asked for input on this approach. Commissioner Altman said the plan makes sense. She said that telehealth could possibly exacerbate disparities but also has the potential to reduce them. Commissioner Stolfi said another part of the charge centers on programs to improve access to historically underserved communities. He asked Working Group members and interested parties to send ideas and programs that should be addressed under this part of the charge.

3. **Heard Presentations on Price Transparency**

Commissioner Stolfi said price transparency ideally would be beneficial to consumers and that it could change dynamics between payers and providers and reduce costs.

Dr. Terri Postma (federal Centers for Medicare and Medicaid Services—CMS Center for Medicare) provided an overview of the hospital price transparency requirements. She said the rule is a first step and must be viewed in context with other transparency rules. She said prior rules required chargemaster prices to be posted online. She said that due to concerns with this rule, the CMS updated the rules to require hospitals to post their standard charges in two ways. She said they must display charges for “shoppable” services in consumer-friendly formats and all charges in machine-readable format. She outlined key definitions in the rule, including which hospitals must comply, how items and services are identified, and what “standard charges” means. She noted the monitoring and enforcement authorities of the CMS.

Matthew Lynch (federal Center for Consumer Information and Insurance Oversight—CCIIO). Mr. Lynch said a recent executive order on transparency shows the administration’s commitment to the issue. He reviewed the transparency in coverage...
requirements applicable to insurers. Mr. Lynch identified the two key provisions as: 1) a requirement for a self-service price comparison tool for consumers to determine their out-of-pocket costs in advance of a service; and 2) a requirement to post prices for 500 shoppable services by January 2023. He said insurers must disclose the remainder of services by January 2024. He said the rule also requires posting of machine-readable files with in-network negotiated rates and historical out-of-network payments. He said states have primary enforcement authority, so the CMS would enforce only if a state does not substantially enforce, except for federal Employee Retirement Income Security Act (ERISA) plans. He provided the email for questions about the insurer transparency rules, PriceTransparencyinCoverage@cms.hhs.gov.

Commissioner Stolfi asked what level of compliance the CMS has seen with the rules. Dr. Postma said the CMS has conducted proactive audits since January and also received complaints. She said her impression is most issues are with the comprehensive machine-readable file requirement. She said the CMS plans an open-door forum to clarify the requirement. She said some hospitals offer price estimator tools that give a range of prices, not a consumer-specific amount that takes their insurance coverage into consideration.

Dr. Postma discussed billing codes, clarifying the different types of codes used to classify prices. Mr. Lynch said the CCIIO would use similar codes.

Commissioner Stolfi asked about the shoppable services. Dr. Postma said her team worked with the CCIIO to analyze Exchange data and other research to identify commonly used services. Mr. Lynch said the CCIIO looked at both commonly used services and services that have wide cost differences in the same geography.

Mr. Sundberg asked whether price transparency could lead hospitals to raise prices and how prices could be tracked over time to determine if prices do increase. Dr. Postma said the CMS concluded that the benefits of transparency greatly outweigh the risk of higher prices. She said machine-readable files must include date information. Mr. Lynch said the long-term goal is lowering prices, but in the short-term, there could be an effect of reduced dispersion in prices, which would include raising the lowest prices and lowering the highest.

Robin Gelburd (FAIR Health) outlined FAIR Health’s work as a private claims repository. She said FAIR Health works with federal agencies and state governments to provide trusted, independent data. She discussed the tools FAIR Health makes available for consumers to research medical costs, including both in-network and out-of-network prices. She said integrating price transparency into clinical decision aids can improve shared decision making between patients and providers. She mentioned FAIR Health’s research and resources, including reports on COVID-19 and a monthly telehealth tracker.

Eric Ellsworth (Consumers’ Checkbook) presented on how greater data would be more useful for consumers. He said consumers shop not only on cost, but also on value, so health care shopping should evolve in that direction. He said price transparency is a big step forward, but consumers still lack key information to aid their shopping. He said that consumers do not order medical services for themselves and that insurers determine payment amounts. He pointed out that consumers often hold the risk for unexpected costs and bad outcomes and that they may never know the full cost of their care. He said consumer needs include individual provider-level quality information, better information on network status, cost information organized around consumer decisions rather than billing codes, detailed estimates of costs with contingency information, and better protection from claim denials. He described requirements for advance explanations of benefits (EOBs) as a game changer, but he said machine-to-machine data flows need to be improved. He said patient-reported outcomes are the biggest gap in quality reporting.

Commissioner Stolfi asked about the use of data from All Payer Claims Databases (APCDs). Ms. Gelburd said that FAIR Health conducted a pilot with New York to make APCD data available to consumers.

Having no further business, the Health Innovations (B) Working Group adjourned.
HEALTH ACTUARIAL (B) TASK FORCE

The Health Actuarial (B) Task Force did not meet at the Summer National Meeting.
REGULATORY FRAMEWORK (B) TASK FORCE

Regulatory Framework (B) Task Force July 28, 2021, Minutes.................................................................7-27
Regulatory Framework (B) Task Force June 15, 2021, Minutes (Attachment One) ...........................................7-31
Pharmacy Benefit Manager Regulatory Issues (B) Subgroup New 2021 Charge (Attachment One-A) ...............7-33
Accident and Sickness Insurance Minimum Standards (B) Subgroup July 12, 2021, Minutes (Attachment Two) .....7-35
Accident and Sickness Insurance Minimum Standards (B) Subgroup June 7, 2021, Minutes (Attachment Three) ....7-37
Mental Health Parity and Addiction Equity Act (MHPAEA) (B) Working Group April 21, 2021, Minutes
(Attachment Four) ...........................................................................................................................................7-38
Draft: 8/9/21

Regulatory Framework (B) Task Force
Virtual Meeting (in lieu of meeting at the 2021 Summer National Meeting)
July 28, 2021

The Regulatory Framework (B) Task Force met July 28, 2021. The following Task Force members participated: Michael Conway, Chair (CO); Glen Mulready, Vice Chair (OK); Lori K. Wing-Heier represented by Sarah Bailey (AK); Jim L. Ridling represented by Anthony L. Williams and Jennifer Li (AL); Evan G. Daniels represented by Jon Savary and Erin Klug (AZ); Ricardo Lara represented by Tyler McKinney (CA); Andrew N. Mais represented by Jared Kosky (CT); David Altmaier represented by Chris Struk (FL); Doug Ommen represented by Andria Seip (IA); Dean L. Cameron (ID); Dana Popish Severinghaus represented by Ryan Gillespie (IL); Amy L. Beard represented by Claire Szpara and Alex Peck (IN); Vicki Schmidt (KS); Sharon P. Clark (KY); Gary D. Anderson represented by Kevin Beagan (MA); Eric A. Cioppa represented by Marti Hooper (ME); Anita G. Fox represented by Renee Campbell and Karen Dennis (MI); Grace Arnold represented by Galen Benshoof, Peter Brickwedde, and Sarah Wohlford (MN); Chlora Lindley-Myers (MO); Mike Causey represented by Ted Hamby (NC); Jon Godfred represented by John Arnold and Chrystal Bartuska (ND); Eric Dunning (NE); Chris Nicolopoulos represented by Michelle Heaton (NH); Judith L. French represented by Laura Miller, Theresa Schaefer, and George McNab (OH); Andrew R. Stolfi represented by TK Keen (OR); Jessica K. Altman (PA); Larry D. Deiter (SD); Doug Slape represented by Rachel Bowden, David Bolduc, and Richard Lunsford (TX); Jonathan T. Pike represented by Jaakob Sundberg and Shelley Wiseman (UT); Scott A. White represented by Julie Blauvelt, Bob Grissom, and Bradley Marsh (VA); Mike Kreidler represented by Molly Nollette, Jane Beyer, and Kimberly Tocco (WA); Mark Afable represented by Richard Wicka and Nathan Houdek (WI); and James A. Dodrill represented by Joylynn Fix and Tonya Gillespie (WV). Also participating was: Russell Toal (NM).

1. **Adopted its June 15 and Spring National Meeting Minutes**

The Task Force met June 15 to adopt a new 2021 charge for the Pharmacy Benefit Manager Regulatory Issues (B) Subgroup to develop a white paper on issues related to the state regulation of certain pharmacy benefit manager (PBM) business practices and the effect, if any, of the recent U.S. Supreme Court decision in *Rutledge v. the Pharmaceutical Care Management Association (PCMA)* on these current and emerging state laws and regulations regulating such business practices. The white paper will also examine the role PBMs, pharmacy services administrative organizations (PSAOs), and other prescription drug supply chain entities play in the provision of prescription drug benefits.

Commissioner Altman made a motion, seconded by Commissioner Deiter, to adopt the Task Force’s June 15 (Attachment One) and March 25 (see NAIC Proceedings – Spring 2021, Regulatory Framework (B) Task Force) minutes. The motion passed unanimously.

2. **Adopted its Subgroup and Working Group Reports**

Commissioner Altman made a motion, seconded by Commissioner Clark, to adopt the following reports: the Accident and Sickness Insurance Minimum Standards (B) Subgroup, including its July 12 (Attachment Two) and June 7 (Attachment Three) minutes; the Employee Retirement Income Security Act (ERISA) (B) Working Group; the Mental Health Parity and Addiction Equity Act (MHPAEA) (B) Working Group, including its April 21 minutes (Attachment Four); and the Pharmacy Benefit Manager Regulatory Issues (B) Subgroup. The motion passed unanimously.

3. **Received a Work Status Update for the ERISA (B) Working Group and the Pharmacy Benefit Manager Regulatory Issues (B) Subgroup**

a. **ERISA (B) Working Group**

Jolie Matthews (NAIC) said the Employee Retirement Income Security Act (ERISA) (B) Working Group plans to meet July 30 to discuss any updates to the *Health and Welfare Plans Under the Employee Retirement Income Security Act: Guidelines for State and Federal Regulation* (ERISA Handbook) related to the U.S. Supreme Court’s decision in *Rutledge* with respect to ERISA preemption of state laws regulating PBM business practices. The Working Group will also discuss the *Rutledge* decision in relation to the Pharmacy Benefit Manager Regulatory Issues (B) Subgroup’s new 2021 charge to develop a white paper discussing state laws regulating PBM business practices. Following these discussions, the Working Group plans to adjourn into regulator-to-regulator session, pursuant to paragraph 3 (specific companies, entities or individuals) of the NAIC Policy Statement on Open Meetings.
b. Pharmacy Benefit Manager Regulatory Issues (B) Subgroup

Mr. Keen said the Pharmacy Benefit Manager (B) Subgroup plans to hold a few organizational meetings to determine what information it needs to work on its new 2021 charge to develop the white paper. He explained that the Subgroup will not be starting its work from scratch because of its work related to the development of the proposed [State] Pharmacy Benefit Manager Licensure and Regulation Model Act (PBM model), but he anticipates the Subgroup will have to hold informational meetings on subjects that it did not consider during that work. The Subgroup also could establish a few ad hoc groups to work on different aspects of the white paper. Mr. Keen said he anticipates the Subgroup will begin meeting following the Summer National Meeting to develop a work plan. He said some the Subgroup’s first meetings will be regulator-to-regulator meetings to discuss a path forward. Mr. Keen said he plans to provide updates to the Task Force on the Subgroup’s work as it moves forward.

4. Heard an Update on the CHIR’s Work Related to the ACA

Christine Monahan (Center on Health Insurance Reforms—CHIR, Georgetown University’s McCourt School of Public Policy) provided an update on the CHIR’s work related to the federal Affordable Care Act (ACA) and recently enacted federal laws such as the federal No Surprises Act (NSA) and the federal American Rescue Plan Act (ARPA) and other issues of interest to state insurance regulators. She discussed the CHIR’s recent publications, including a 50-state survey of state employee benefit plans and efforts to restrain health care costs. The CHIR received responses from 47 states and interviewed state employee benefit plan administrators in 11 of those states to better understand what these states are doing to address health care costs. The CHIR also recently published issue brief on state actions between March 2020 and March 2021 to expand telemedicine access during COVID-19 and future policy considerations.

Ms. Monahan said the CHIR is researching and expects to release issue briefs or blogs on standardized plans, limited plan sales, state “Easy Enrollment” programs, efforts by select state-based marketplaces (SBMs) to improve health equity, and small group health insurance market trends. She highlighted some of the CHIR’s future work related to NSA implementation, including working with states with existing balance billing laws and technical assistance available to the states and its ongoing work related to network adequacy. Ms. Monahan said the CHIR is closely monitoring federal and state efforts to develop and implement public options. She said the CHIR recently published a blog post for the Commonwealth Fund comparing the laws in Washington, Colorado, and Nevada.

Ms. Monahan said the CHIR is beginning to examine the role of ERISA and its impact on state efforts to address cost containment with respect to employer plans. She said that among other things, the CHIR wants to better understand the legal landscape facing states that want to try to encourage cost containment among employer plans and document current efforts in this area. She said that one goal of this research is for the CHIR to make recommendations on whether and to what extent federal legislative or regulatory changes are needed to better foster cost containment by employer plans. As part of this research effort, the CHIR plans to reach out to stakeholders and conduct interviews in late 2021. She said to let the CHIR know if anyone is interested in this issue or knows of specific stakeholders the CHIR should interview.

5. Heard a Presentation on the NSA IFR and Implications for the States

Katie Keith (Out2Enroll) and Jack Hoadley (Georgetown University Health Policy Institute) presented on the recently issued NSA interim final rule (IFR) and implications for the states. Ms. Keith provided an overview of the NSA’s scope, including what types of plans it covers and where its protections apply. She said the NSA’s IFR was issued July 1 with an effective date of Sept. 13. The IFR was issued jointly by the U.S. Department of Labor (DOL), the U.S. Department of Health and Human Services (HHS), the U.S. Department of the Treasury (Treasury Department), and the U.S. Office of Personnel Management (OPM).

Ms. Keith said the IFR includes provisions focused on both patients and regulated entities. She explained that the patient-focused provisions outline how patients can calculate cost-sharing, include notice-and-consent waivers provisions, and establish a consolidated complaints process. The regulated entities-focused provisions outline how to calculate the qualifying payment amount and include disclosure requirements and provisions related to communications between insurers and providers.

Mr. Hoadley discussed the scope of the NSA’s balance billing protections with respect to the types of providers subject to its requirements. He explained that the NSA applies to emergency care provided in in-network or out-of-network facilities. Specifically, the NSA includes emergency departments and independent free-standing emergency departments. He said the IFR extends the scope of the NSA’s protections to urgent care services licensed by the state for emergency services. Mr. Hoadley also discussed the NSA’s protections with respect to post-stabilization services, including its application regardless of where in a hospital the services are furnished. He said the IFR includes strong patient protections for waivers in
these circumstances, including requirements that: 1) the patient must be able to travel using nonmedical/nonemergency transportation; 2) the patient gives informed consent; and 3) the in-network facility is within a reasonable distance. He also discussed the scope of the NSA’s protections regarding air ambulance services providers.

Mr. Hoadley discussed the NSA’s protections in circumstances where a patient receives non-emergency services from an out-of-network provider while at an in-network facility. He explained what facilities are included in the NSA’s definition of “health care facility” but noted that the IFR does not identify any additional facilities, which leaves open as to whether the NSA’s protections for non-emergency services would apply to other facilities not included in the NSA’s definition, such as urgent care facilities and retail clinics. Mr. Hoadley discussed other clarifying provisions in the IFR regarding services provided by out-of-network providers in an in-network facility.

Mr. Hoadley detailed the notice and consent provisions explaining what a patient can and cannot waive with respect to the NSA’s balance billing protections. Patients can knowingly and voluntarily agree to be balance billed by out-of-network providers but only for: 1) non-emergency care from an out-of-network provider; or 2) out-of-network post-stabilization services. Patients can not waive protections: 1) when there is no in-network provider available; 2) for urgent or unforeseen care; 3) when services are delivered by providers in designated specialties, such as anesthesiology, radiology, hospitalists, or intensivists; and 4) post-stabilization services except for out-of-network post-stabilization services. The IFR includes a draft standard notice and consent form. He said the federal agencies are seeking comment on the draft notice and consent form and are interested in any forms that those states with existing balance billing laws may use.

Mr. Hoadley explained the IFR’s provisions concerning the in-network qualifying payment amount (QPA) for an out-of-network provider. The IFR spells out definitions and methodology for determining the QPA. It also includes additional provisions affecting the QPA, including minimizing the influence of outlier prices that could skew the QPA higher. He pointed out that the IFR does not include the NAIC’s recommendation to base region on qualified health plan (QHP) rating areas, but uses another principle suggested—metropolitan statistical areas (MSAs) and non-MSA areas in a state. Mr. Hoadley also explained that the IFR defines what a “specified state law” is for purposes of determining what method will be used to determine the amount of payment to an out-of-network provider, which could be either a payment standard or arbitration or a combination of both. The IFR also specifies that states with self-funded opt-in programs can maintain those programs. If state law does not apply, the NSA applies.

Mr. Hoadley said the IFR confirms that state departments of insurance (DOIs) are the primary enforcers of provisions that apply to insurers and fully insured health products. The HHS will enforce the NSA’s requirements in states that fail to substantially enforce the law. The DOL will enforce the NSA’s provisions for self-funded group health plans. The same enforcement framework is established with respect to providers, including air ambulances. Mr. Hoadley noted that the NSA and the IFR are silent on which state agency is to enforce the NSA’s provider provisions.

Mr. Hoadley discussed key considerations for the states, particularly that state laws can be more protective of consumers if the state law does not “prevent the application of federal law.” The IFR includes a few examples of this. He also noted that the IFR does not specify which state laws qualify as “specified state law” or when the “specified state law” would apply. He explained that the IFR sets out specific scenarios in determining whether the “specified state law” would apply or the NSA.

Ms. Keith said it is anticipated that the federal government will issue additional NSA rules in 2021, including federal rules on the independent dispute resolution process (interim final rule) and enforcement and air ambulance data reporting (proposed rule). She said additional federal rulemaking will occur over time on other NSA requirements, such as accurate provider directories, gag clauses, and PBM reporting requirements. However, these rules will not be promulgated prior to the NSA’s 2022 effective date.

Commissioner Mulready asked about how the NSA and the IFR treats emergency services and urgent care services. He noted Mr. Hoadley’s discussion about whether urgent care facilities will be considered “health care facilities” for purposes of the NSA. Mr. Hoadley said the NSA focuses on emergency services provided in relation to an emergency department—not urgent care services provided in an urgent care center unless the state licenses the urgent care center to provide emergency services. He said that because of this, if a consumer receives services at an out-of-network urgent care center, then the NSA would not provide balance billing protections because the urgent care center will be considered to have provided non-emergency services, not emergency services.

Commissioner Conway asked about the IFR’s provisions regarding the circumstances when a consumer can waive the NSA’s balance billing protections. He said that in Colorado, essentially any provider can ask a consumer to waive Colorado’s balance billing protections. He asked Mr. Hoadley if the NSA, which restricts the ability of certain types of providers from asking
consumers to waive its balance billing protections, would prevail over Colorado’s law. Mr. Hoadley said that although the IFR does not strictly detail this situation, he believes that the NSA would most likely prevail.

Having no further business, the Regulatory Framework (B) Task Force adjourned.
The Regulatory Framework (B) Task Force met June 15, 2021. The following Task Force members participated: Michael Conway, Chair (CO); Glen Mulready, Vice Chair, represented by Andrew Schallhorn and Mike Rhoads (OK); Lori K. Wing-Heier represented by Sarah Bailey (AK); Jim L. Ridling represented by William Rodgers, Reyn Norman, and Yada Horace (AL); Evan G. Daniels represented by Jon Savary (AZ); Ricardo Lara represented by Bruce Hinze and Tyler McKinney (CA); Andrew N. Mais represented by Jared Kosky (CT); David Altmaier represented by Chris Struk (FL); Doug Ommen (IA); Dean L. Cameron represented by Kathy McGill (ID); Dana Popish Severinghaus represented by Eric Anderson and Ryan Gillespie (IL); Amy L. Beard represented by Claire Szpara and Alex Peck (IN); Vicki Schmidt (KS); Sharon P. Clark (KY); Gary D. Anderson represented by Kevin Beagan (MA); Eric A. Cioppa represented by Robert Wake (ME); Anita G. Fox represented by Chad Arnold, Sarah Wohlford, and Karen Dennis (MI); Grace Arnold represented by Galen Benshoof, Chad Arnold, and Sherri Mortensen-Brown (MN); Chlora Lindley-Myers represented by Amy Hoyt and Camille Anderson-Weddle (MO); Mike Causey represented by Robert Croom (NC); Jon Godfread represented by Chrystal Bartuska (ND); Eric Dunning represented by Martin Swanson and Tom Green (NE); Chris Nicolopoulos represented by Maureen Belanger (NH); Marlene Caride represented by Chanell McDevitt (NJ); Judith L. French represented by Marjorie Ellis (OH); Andrew R. Stolfi represented by TK Keen (OR); Jessica K. Altman (PA); Larry D. Deiter represented by Jill Kruger (SD); Doug Slape represented by Rachel Bowden and David Bolduc (TX); Jonathan T. Pike represented by Tanji J. Northrup (UT); Scott A. White represented by Don Beatty (VA); Mike Kreidler represented by Molly Nollette (WA); Mark Afable represented by Nathan Houdek and Jennifer Stegall (WI); and James A. Dodrill represented by Ellen Potter (WV).

1. **Adopted a New Pharmacy Benefit Manager Regulatory Issues (B) Subgroup Proposed Charge**

Commissioner Conway said that during the Task Force’s March 18 meeting, the Task Force discussed and agreed to consider a new 2021 charge for the Pharmacy Benefit Manager Regulatory Issues (B) Subgroup to develop a white paper consistent with some of the comments received on the draft [State] Pharmacy Benefit Manager Licensure and Regulation Model Act (PBM model). He said that prior to the meeting, NAIC staff distributed a draft of the proposed charge for the Subgroup to “develop a white paper to: 1) analyze and assess the role PBMs play in the provision of prescription drug benefits; 2) identify, examine, and describe current and emerging state regulatory approaches to PBM business practices, such as price transparency and reporting requirements, rebating, and spread pricing, including the implications of the Rutledge vs. Pharmaceutical Care Management Association (PCMA) decision on such business practices; and 3) discuss any challenges, if any, the states have encountered in implementing such laws and/or regulations.”

Commissioner Conway said the Task Force received comments on the proposed charge from America’s Health Insurance Plans (AHIP), the Blue Cross and Blue Shield Association (BCBSA), the National Community Pharmacists Association (NCPA), and the Pharmaceutical Care Management Association (PCMA). He requested comments from the Task Force on the proposed charge. Mr. Swanson expressed support for the proposed charge, particularly the importance of cataloging current state laws regulating pharmacy benefit manager (PBM) business practices and emerging state laws. He also stressed the importance of examining PBM functions and seeing how they are operating. Mr. Swanson also discussed the importance of the white paper including some sort of analysis of the cost versus the benefits of PBM regulation and how it is working operationally with respect to consumers and other stakeholders, such as state departments of insurance (DOIs). He said it is important that the white paper examine the entire prescription drug supply chain, starting with the prescription drug manufacturers to the insurer contracts with the PBMs, pharmacists, and other entities involved in the supply chain, and ending with the end user, the consumer. The white paper should not just focus on PBMs. Mr. Swanson also agreed that it is important the white paper examine the Rutledge decision and the implications of that decision, if any, on states implementing laws on PBM business practices, including contracting issues.

Mr. Wake expressed support for Mr. Swanson’s comments suggesting the white paper examine the entire prescription drug supply chain. He also agreed with Mr. Swanson’s comments concerning the Rutledge decision. Mr. Kosky also agreed with Mr. Swanson’s comments with respect to examining and understanding the entire prescription drug supply chain to avoid the balloon effect of making regulatory changes to one part of the supply chain, which might affect costs and unintentionally shifting that change in cost to another part of the chain. Additional Task Force members expressed support for broadening the proposed charge to include other entities in the prescription drug supply chain. The Task Force also discussed, but it deferred.
deciding on, whether the Pharmacy Benefit Manager Regulatory Issues (B) Subgroup’s name would have to be changed to reflect the addition of other entities involved in the prescription drug supply chain.

Kris Hathaway (AHIP) discussed AHIP’s comment letter. She explained AHIP’s recommendation to broaden the proposed charge to include other entities in the prescription drug supply chain in addition to PBMs and the role these entities play in the provision of affordable prescription drug benefits. She noted the recent passage of pharmacy service administrative organization (PSAO) transparency legislation in Maryland. She said this legislation illustrates steps the states can take to conduct a more thorough, holistic review of the prescription drug supply chain and better understand all aspects of drug pricing. Ms. Hathaway also said AHIP supports the NAIC conducting an analysis of the Rutledge decision. Randi Chapman (BCBSA) said the BCBSA, like AHIP, supports broadening the proposed charge to include other entities in the prescription drug supply chain. She said the BCBSA also supports the NAIC’s planned analysis of the Rutledge decision. She noted that this year, at least 35 states have introduced PBM legislation in response to that decision. Given this, it is important for the NAIC to review and analyze this legislation to fully understand the scope of these bills and any unintentional barriers such legislation could place on patient access to medication.

Lauren Rowley (PCMA) discussed the PCMA’s comment letter, which includes a recommendation to expand the charge to include other entities involved in the prescription drug supply chain. She also noted the recent legislation passed in Maryland related to PSAOs and similar legislation recently passed in Louisiana. Ms. Rowley said that although it is not included in the PCMA’s written comments, the PCMA reiterates its suggestion that the Employee Retirement Insurance Security Act (ERISA) (B) Working Group is the more appropriate NAIC group to initially examine the Rutledge decision given its members’ expertise on ERISA preemption issues.

The Task Force discussed the PCMA’s suggested revisions to the proposed charge. Some Task Force members expressed concern with potentially narrowing the charge with the PCMA’s suggestion to revise the language to state “PBM business practices related to drug prices,” particularly if one goal of this proposed charge is to allow the Pharmacy Benefit Manager Regulatory Issues (B) Subgroup to examine the business practices in the drafting note in Section 8—Regulations of the draft [State] Pharmacy Benefit Manager Licensure and Regulation Model Act. For similar reasons, some Task Force members expressed concern with deleting the word “rebating” and substituting in its place the language “manufacturer rebates.” Ms. Rowley explained the PCMA’s reasoning for narrowing the proposed charge with its suggested revisions.

Matthew Magner (NCPA) discussed the NCPA’s comments, including its suggested revisions to the proposed charge. He said the NCPA suggests certain revisions to the proposed charge in recognition of the fact that PBMs play a larger role in the provision of prescription drug benefits far beyond administering reimbursements to providers on behalf of insurers, such as creating provider networks, negotiating drug prices and rebates, and developing drug formularies. Mr. Magner said the NCPA also believes it is important the proposed charge includes not only identifying, examining, and describing current and emerging state regulatory approaches to PBM business practices, but their sources of revenue as well. He said another suggested revision to the proposed charge would require a discussion of any challenges the states have in investigating violations of their laws or regulations. The Task Force discussed NCPA’s suggested revisions to the proposed charge. After discussion, the Task Force concluded that generally, the language of the proposed charge would address the NCPA’s suggested revisions.

Carl Schmid (HIV+Hepatitis Policy Institute) expressed support for the proposed charge, noting the NAIC consumer representatives had initially suggested the Subgroup be charged with developing a white paper during the Task Force’s March 18 meeting. He said the NAIC consumer representatives did have questions as to the process the Subgroup would use to complete the proposed charge, such as contracting out to a third party, and the timeline for completing the charge. He also noted the role PBMs play in other aspects of the prescription drug supply chain, such as PBMs’ role in determining patient cost. Mr. Schmid also expressed support for including the NCPA’s suggested revisions to the proposed charge and expansion of the charge beyond a focus on drug pricing, as the PCMA suggests.

Commissioner Conway said that based on the discussion, he believes the Task Force has consensus to revise the proposed charge to add the following language from the PCMA’s comment letter: “Pharmacy Services Administrative Organizations (PSAOs) and other supply chain entities.” No one disagreed. Mr. Hinze made a motion, seconded by Mr. Keen to add the PCMA language to the proposed charge (Attachment One-A). The motion passed unanimously.

Having no further business, the Regulatory Framework (B) Task Force adjourned.

2021 REVISED CHARGES

REGULATORY FRAMEWORK (B) TASK FORCE

The mission of the Regulatory Framework (B) Task Force is to: 1) develop NAIC model acts and regulations for state health care initiatives; and 2) consider policy issues affecting state health insurance regulation.

Ongoing Support of NAIC Programs, Products and Services

1. The Regulatory Framework (B) Task Force will:
   A. Coordinate and develop the provision of technical assistance to the states regarding state-level implementation issues raised by federal health legislation and regulations.
   B. Review managed health care reforms, their delivery systems occurring in the marketplace and other forms of health care delivery. Recommend appropriate revisions to regulatory jurisdiction, authority and structures.
   C. Consider the development of new NAIC model laws and regulations and the revision of existing NAIC model laws and regulations, including those affected by federal legislation and final federal regulations promulgated pursuant to such legislation.
   D. Continue to review NAIC models recommended for revision by the former Affordable Care Act (ACA) Model Review (B) Working Group and, as appropriate, appoint a working group or subgroup to revise the NAIC model(s) prioritized for revision in 2021.
   E. At the direction of the Health Insurance and Managed Care (B) Committee, through the work of the Employee Retirement Income Security Act (ERISA) (B) Working Group, monitor, analyze and report developments related to association health plans (AHPs).
   F. Monitor, analyze and report, as necessary, developments related to short-term, limited-duration (STLD) coverage.

2. The Accident and Sickness Insurance Minimum Standards (B) Subgroup will:
   A. Review and consider revisions to the Model Regulation to Implement the Accident and Sickness Insurance Minimum Standards Model Act (#171).

3. The ERISA (B) Working Group will:
   A. Monitor, report and analyze developments related to the federal ERISA, and make recommendations regarding NAIC strategy and policy with respect to those developments.
   B. Monitor, facilitate and coordinate with the states and the U.S. Department of Labor (DOL) related to sham health plans.
   C. Monitor, facilitate and coordinate with the states and the DOL regarding compliance and enforcement efforts regarding the ACA that relate to ERISA.

4. The Mental Health Parity and Addiction Equity Act (MHPAEA) (B) Working Group will:
   A. Monitor, report and analyze developments related to the federal Paul Wellstone and Pete Domenici Mental Health Parity and Addiction Equity Act of 2008 (MHPAEA), and make recommendations regarding NAIC strategy and policy with respect to those developments.
   B. Monitor, facilitate and coordinate best practices with the states, the DOL and the U.S. Department of Health and Human Services (HHS) related to the MHPAEA.
   C. Monitor, facilitate and coordinate with the states and the DOL regarding compliance and enforcement efforts regarding the ACA that relate to the MHPAEA.
   D. Provide supplemental resources to support documentation and reporting in the MHPAEA chapter of the NAIC Market Regulation Handbook.
   E. Coordinate with and provide input to Market Regulation and Consumer Affairs (D) Committee groups, as necessary, regarding mental health parity market conduct examinations.
5. The Pharmacy Benefit Manager Regulatory Issues (B) Subgroup will:
   A. Consider developing a new NAIC model to establish a licensing or registration process for pharmacy benefit managers (PBMs). The Subgroup may consider including in the new NAIC model provisions on PBM prescription drug pricing and cost transparency.
   B. Develop a white paper to: 1) analyze and assess the role PBMs, Pharmacy Services Administrative Organizations (PSAOs), and other supply chain entities, play in the provision of prescription drug benefits; 2) identify, examine and describe current and emerging state regulatory approaches to PBM business practices, such as price transparency and reporting requirements, rebating and spread pricing, including the implications of the Rutledge vs. Pharmaceutical Care Management Association (PCMA) decision on such business practices; and 3) discuss any challenges, if any, the states have encountered in implementing such laws and/or regulations.

NAIC Support Staff: Jolie H. Matthews/Jennifer R. Cook
The Accident and Sickness Insurance Minimum Standards (B) Subgroup of the Regulatory Framework (B) Task Force met July 12, 2021. The following Subgroup members participated: Laura Arp, Co-Chair (NE); Andrew Schallhorn, Co-Chair (OK); Debra Judy (CO); Chris Struk and Shannon Doheny (FL); Robert Wake (ME); Sherri Mortensen-Brown (MN); Camille Anderson-Weddle (MO); Gayle Woods (OR); Kathleen Kellock (SC); Rachel Bowden (TX); Tanji J. Northrup (UT); Ned Gaines (WA); and Jennifer Stegall (WI).

1. **Discussed Revisions to Model #171**

Ms. Arp said during the Subgroup’s June 7 meeting, the Subgroup requested new comments and additional comments on Sections 1 through 7 of the Model Regulation to Implement the Accident and Sickness Insurance Minimum Standards Model Act (#171). She said she would like the Subgroup to review and discuss those comments beginning with Section 1—Purpose using the comment chart NAIC staff prepared. There was no objection.

The Subgroup discussed the Missouri Department of Insurance’s (DOI’s) suggestion to add the word “renewal” to Section 1. The Subgroup agreed to add the word “renewal.” No comments were received on Section 2—Authority.

The Subgroup next discussed the Blue Cross Blue Shield Association’s (BCBSA’s) suggestion to add language to Section 3A—Application and Scope defining the term “short-term, limited-duration insurance” to ensure that there is consistency with the meaning and use of this term in both the Supplementary and Short-Term Health Insurance Minimum Standards Model Act (#170) and this model, which is Model #170’s companion model regulation. The Subgroup discussed the BCBSA’s suggested revision. The Subgroup also discussed whether it should consider adding a new section to Model #171 for definitions that apply to the model along with Section 5—Policy Definitions, which defines terms used in a policy. After additional discussion, the Subgroup agreed to potentially add the BCBSA’s suggested revision and add a new section defining terms used in Model #171, such as a definition of “short-term, limited-duration insurance” and any other terms used only in Model #171. The Subgroup also agreed to specifically discuss what terms should be included in the new definition section after it finishes its review and discussion of suggested revisions to Model #171. The Subgroup also discussed the need for it to be aware that short-term, limited-duration (STLD) insurance, which is a form of major medical insurance, will need to be treated differently than the other types of policies covered in Model #171, which are supplemental policies.

The Subgroup agreed to accept the Missouri DOI’s suggestion to delete “shall apply” and substitute “applies” in Section 3B.

The Subgroup also agreed to accept the Health Benefits Institute’s (HBI’s) suggested revision to Section 3C to add language that Model #171 does not apply to limited long-term care insurance (LTCI) policies subject to the requirements of the Limited Long-Term Care Insurance Model Act (#642).

No comments were received on Section 4—Effective Date.

The Subgroup next discussed Section 5, beginning with the BCBSA’s suggested comments on Section 5A to revise the language to refer to “a supplementary policy or short-term, limited-duration insurance.” Randi Chapman (BCBSA) said the BCBSA’s suggestion is consistent with the discussion related to Section 3A. The Subgroup discussed whether it should add the word “certificate” to address group coverage. Mr. Wake suggested that the Subgroup needs to examine the changes made to Model #170 to ensure that the revisions, both substantively and related to terminology, to Model #171 are consistent with those changes. He said there are various approaches the Subgroup could use to encompass the similarities between supplementary coverage and STLD insurance coverage and figure out what provisions should or should not apply to STLD policies.

Ms. Arp suggested that the Subgroup consider revising the language to state, “short-term, limited-duration coverage” for consistency with Model #170. Ms. Bowden said she does not have an objection to Ms. Arp’s suggestion, but she said the Subgroup needs to keep in mind the idea of adding “certificate,” as appropriate, when using the term “policy.” She suggested that the Subgroup might want to consider adding a definition of “policy,” which would include the term “certificate.” The Subgroup discussed this issue and the issue of having two definition sections—one for definitions of terms used in Model #171...
and the other for terms used in the policy, which is currently Section 5. Ms. Arp pointed out that Model #170 includes a definition of “policy.” She said if the Subgroup wants to find a term for “policy” that will also mean “certificate” or other similar terms, then it would have to find another term to use.

Chris Petersen (Arbor Strategies LLC) suggested that the issue the Subgroup is discussing might not be a definitional issue, but a scope and applicability issue that can be more appropriately addressed in Section 3. Mr. Wake said Mr. Petersen’s suggestion might not address potential issues with regulating a group master policy versus regulating an individual policy. He stressed that whatever approach the Subgroup decides to take that it be consistent. J.P. Wieske (HBI) said this issue illustrates how the Subgroup will have to carefully craft revisions differentiating between STLD insurance coverage and the other types of coverages regulated in Model #171. Mr. Petersen said this also illustrates why STLD insurance coverage should have its own section in Model #171. The Subgroup discussed the issue of group coverage and STLD insurance coverage. Mr. Wieske said the Subgroup might have to consider dealing with it by using terminology such as “individually underwritten policy.” Ms. Arp said as already discussed, the Subgroup will add another definition section to define terms used in Model #171; but to deal with this issue, the Subgroup might have to add in its section for STLD insurance coverage, a provision defining certain terms that would apply only to that type of coverage.

Mr. Schallhorn suggested that the Subgroup might have to use the language “policy or certificate” when referring to STLD insurance coverage. The Subgroup discussed Mr. Schallhorn’s suggestion. The Subgroup also discussed the implications of adding “certificate,” which could potentially require state DOIs to review each certificate. After additional discussion, the Subgroup decided not to make the revision.

The Subgroup discussed other suggestions to revise Section 5A, including revising it to state, “[e]xcept as provided in this regulation, all policies subject to this regulation shall use the definitions as provided in this section.” The Subgroup discussed an issue that not all policies subject to Model #171 would use all the policy definitions in Section 5. To address this issue, the Subgroup discussed whether to revise the suggested revision to Section 5A to state, “[e]xcept as provided in this regulation, to the extent these definitions are used in a policy or certificate, all policies subject to this regulation shall use the definitions as provided in this section.” The Subgroup discussed how to incorporate the idea that the definitions are a minimum standard, but also permit deviations when favorable to the consumer. Ms. Arp suggested that the Subgroup consider for discussion during its next meeting July 26 the language, “shall not be defined more restrictively” and “shall not be more restrictive.” She said this language is used in several of the policy definitions in Section 5, such as the definition of “preexisting condition,” “sickness,” and “total disability.” The Subgroup discussed this with respect to whether such language is favorable or unfavorable to the consumer. The Subgroup also discussed how this is further complicated in the policy definition of “preexisting condition” because of its inclusion of the prudent person standard language.

Having no further business, the Accident and Sickness Insurance Minimum Standards (B) Subgroup adjourned.
The Accident and Sickness Insurance Minimum Standards (B) Subgroup
Virtual Meeting
June 7, 2021

The Accident and Sickness Insurance Minimum Standards (B) Subgroup of the Regulatory Framework (B) Task Force met June 7, 2021. The following Subgroup members participated: Laura Arp, Co-Chair (NE); Andy Schallhorn, Co-Chair (OK); Debra Judy (CO); Chris Struk (FL); Robert Wake (ME); Sherri Mortensen-Brown (MN); Camille Anderson-Weddle (MO); Katie Dzurec (PA); Shari Miles (SC); Rachel Bowden (TX); Heidi Clausen and Shelley Wiseman (UT); Kimberly Tocco (WA); and Nathan Houdek and Jennifer Stegall (WI).

1. Discussed the Model #171 Working Draft

Jolie H. Matthews (NAIC) walked the Subgroup through a working draft of preliminary revisions to the Model Regulation to Implement the Accident and Sickness Insurance Minimum Standards Model Act (#171). She explained that the preliminary revisions in italics reflect Subgroup decisions made during the Subgroup’s meetings in late 2019. Ms. Matthews said other preliminary revisions reflect her attempt to revise Model #171 for consistency with the Supplementary and Short-Term Health Insurance Minimum Standards Model Act (#170), which is the companion model to Model #171. She highlighted provisions the Subgroup had deferred deciding on whether to revise, including revisions to the term “preexisting condition” in Section 5L—Policy Definitions.

Ms. Matthews said that during the Subgroup’s last meeting on Dec. 16, 2019, the Subgroup ended its discussion of the comments received on Sections 1–5 with the term “total disability” in Section 5O. She said that also during this meeting, the Subgroup set a public comment deadline ending Feb. 7, 2020, to receive comments on Sections 6–7 of Model #171. She said the comments received by the Feb. 7, 2020, public comment deadline are posted on the Subgroup’s web page on the NAIC website.

Ms. Matthews explained that during its Dec. 16, 2019, meeting, the Subgroup requested: 1) information on how the term “preexisting condition” is defined in state law; 2) examples of how this definition is applied differently to various products that are applicable to Model #171; and 3) feedback on how Section 7—Preexisting Conditions of Model #170 applies or does not apply to the policy definition of “preexisting condition” in Section 5L of Model #171. She said she received comments from several states, which she has included in a chart posted on the Subgroup’s web page. The Subgroup also received comments from America’s Health Insurance Plans (AHIP), the Health Benefits Institute (HBI) and the NAIC consumer representatives. These comment letters also are posted on the Subgroup’s web page.

Ms. Arp asked for clarity about the term “preexisting condition” in Section 5L. Chris Petersen (Arbor Strategies LLC) explained that there appeared to be some confusion among Subgroup members when this term was discussed in 2019. He said the Subgroup should be cognizant of the fact that Section 5 is not a typical “definitions” section. He said Section 5 is a policy definitions section, which means the terms “defined” in this section are terms that can be used in policies subject to Model #171’s requirements. The terms in Section 5 are not terms necessarily used in Model #171, but terms that, if included in a policy subject to Model #171’s requirements, the insurer must “define” those terms in the policy consistent with the way the term is “defined” in Section 5 or consistent with state law requirements if those requirements are different from Model #171’s requirements. The Subgroup discussed the potential implications with taking certain approaches to revising the term “preexisting condition” based on stakeholder comments, including the use of the prudent layperson standard or a more objective definition of the term to make it easier for consumers to understand.

Noting that it has been a while since the Subgroup last met, Ms. Arp suggested the Subgroup set a new public comment period ending July 2 to receive comments from stakeholders on Sections 1–7 of Model #171. She said stakeholders who have already submitted comments on those sections may resubmit those comments or submit new comments. She said the Subgroup would meet sometime in mid-July to resume its discussion of revisions to Model #171 based on the comments received by the July 2 public comment deadline. Mr. Petersen reminded the Subgroup that Model #170 has been adopted by the full NAIC membership. He said because of this, during its discussions of revisions to Model #171, the Subgroup should not spend time relitigating provisions already resolved in Model #170. Ms. Arp asked NAIC staff to post a redline version of Model #170 to the Subgroup’s web page to assist the Subgroup in its discussions.

Having no further business, the Accident and Sickness Insurance Minimum Standards (B) Subgroup adjourned.
Mental Health Parity and Addiction Equity Act (MHPAEA) (B) Working Group
Virtual Meeting
April 21, 2021

The MHPAEA (B) Working Group of the Regulatory Framework (B) Task Force met April 21, 2021. The following Working Group members participated: Katie Dzurec, Chair (PA); Jane Beyer, Vice Chair (WA); Crystal Phelps (AR); Erin Klug (AZ); Sheirin Ghoddoocy (CA); Cara Cheevers (CO); Kurt Swan (CT); Howard Liebers (DC); Sarah Crittenden (GA); Andria Seip (IA); Ryan Gillespie and Erica Weyhenmeyer (IL); Julie Holmes (KS); Erica Bailey (MD); Andrew Kleinendorst (MN); Jeannie Keller (MT); Rosemary Gillespie, Tracy Biehn and Kathy Shortt (NC); Sara Gervings and Chrystal Bartuska (ND); Tyler Brannen and Michelle Heaton (NH); Ralph Boeckman (NJ); Paige Duhamel and Viara Ianakieva (NM); Todd Oberholtzer, Kyla Dembski, Molly Mottram, Theresa Schaefer and Marjorie Ellis (OH); Mike Rhoads, Theresa Green and Cuc Nguyen (OK); Alyssa Metivier (RI); Kendall Buchanan (SC); Jill Kruger (SD); Rachel Bowden (TX); Tanji J. Northrup (UT); Brant Lyons (VA); Barbara Belling (WI); Joylynn Fix (WV); and Tana Howard (WY).

1. Received Updates from the DOL and the CCIIO

Amber Rivers (U.S. Department of Labor—DOL) discussed the federal Consolidated Appropriations Act of 2021 (CAA), which amended the MHPAEA to provide important new protections. She said one of the main new protections is a requirement in the CAA to expressly require group health plans and health insurance issuers offering group or individual health insurance coverage that offer both medical/surgical (M/S) benefits and mental health or substance use disorder (MH/SUD) benefits and that impose non-quantitative treatment limitations (NQTLs) on MH/SUD benefits to perform and document their comparative analyses of the design and application of NQTLs.

Ms. Rivers explained that in addition, beginning 45 days after the date of enactment of the CAA, these plans and issuers must make their comparative analyses available to the DOL, the U.S. Department of Health and Human Services (HHS), and the U.S. Department of the Treasury (Treasury Department) (collectively, “the Departments”) or applicable state authorities, upon request. She said under the CAA, the Departments must request a plan or issuer to submit comparative analyses for plans that involve potential MHPAEA violations or complaints regarding noncompliance with the MHPAEA that concern NQTLs and any other instances the Departments determine appropriate. After review of the comparative analyses, the Departments must share information on findings of compliance and noncompliance with the state where the plan is located or the state where the issuer is licensed to do business.

Ms. Rivers said given the shared responsibilities in the CAA between the Departments and the states, the Departments recently released a set of frequently asked questions (FAQ) about MH/SUD parity implementation and part 45 of the CAA, which can be found on the DOL website at this link: https://www.dol.gov/sites/dolgov/files/EBSA/about-ebsa/our-activities/resource-center/faqs/aca-part-45.pdf. She highlighted a few key points in the FAQ document, including guidance on what a sufficient comparative analysis would include and examples of reasons the Departments might find a comparative analysis to be insufficient. The FAQ document also highlights the fact that the state insurance regulators can request a copy of a plan’s or issuer’s comparative analysis. Ms. Rivers said the FAQ document also notes the DOL’s intent to focus on four areas when making a request for a plan’s comparative analysis, including prior authorization, standards for participation in a provider network, and reimbursement rates.

Mary Nugent (Center for Consumer Information and Insurance Oversight—CCIIIO) expressed support for Ms. Rivers’ comments about the importance of the CAA in providing new protections related to MHPAEA parity compliance. She noted that the recently issued FAQ document that Ms. Rivers discussed was developed and issued jointly by the Departments. As such, the HHS will be using them as a guidance as it moves forward with implementing the CAA’s NQTL comparative analysis review requirements. Ms. Nugent explained that moving forward, due to overlapping jurisdiction, the HHS anticipates that the states will generally continue to enforce the MHPAEA parity requirements, including the CAA’s new NQTL comparative analysis requirements. The HHS will continue to enforce the MHPAEA parity requirements in the three states it currently has enforcement authority over.

2. Heard a Discussion on Equity and Diversity in the MH/SUD Treatment Context

Ms. Dzurec said the Working Group’s next agenda item concerns a proposed new 2021 charge to the Working Group from the Special (EX) Committee on Race and Insurance to “develop model educational material for state departments of insurance
(DOIs) and research disparities in and interplay between mental health parity and access to culturally competent care for people of color and other underrepresented groups.” She said the Working Group included this item on the agenda in preparation for working on this new charge.

Kris Hathaway (America’s Health Insurance Plans—AHIP) discussed AHIP’s health equity activities as a precursor to additional conversations with the Working Group in the future. She highlighted three AHIP proactive strategies—promoting behavioral health integration, value-based mental health care, and the effective use of technology. She noted the substantial increase in the use of telehealth for the provision of mental health services during the past year. She said because of this, some of AHIP’s member plans have been looking at how to provide access to telehealth services for those plan enrollees who would lack the technology to do so, such as setting up private cubicles in community centers for telehealth visits with providers. She also touched on AHIP’s health equity activities, particularly a new initiative, “Project Link,” which is a collaborative partnership initiative examining social determinants of health to find ways and best practices to effectively address social barriers to good health. She also briefly discussed current AHIP health equity workstreams. One of the workstreams is examining approaches to collecting demographic data from plan enrollees in a culturally sensitive way. Ms. Hathaway also discussed the work of AHIP’s Health Equity Measures Value-Based Care Work Group. She highlighted the work AHIP has been doing with the Blue Cross Blue Shield Association (BCBSA) regarding the Vaccine Community Connectors program, which is a program seeking to reduce vaccination disparities for individuals over 65 in the most vulnerable and underserved communities, such as Black and Hispanic communities. She reiterated AHIP’s willingness to make subject matter experts (SMEs) available to speak to the Working Group in more detail about AHIP’s health equity activities that she just highlighted.

Andrew Sperling (National Alliance on Mental Illness—NAMI) discussed findings from studies already conducted underscoring the link between mental health and race and health disparities, particularly the findings from a study trying to determine the state-of-the-art treatment for schizophrenia. He also discussed a large mental health study conducted by a former U.S. Surgeon General documenting the slow pace in which the mental health/behavioral health field was addressing cultural competence and care as well as the wide disparities that exist there in terms of exploring cultural competence and defining cultural conflicts, while also ensuring that providers were trained in cultural competence in the way they deliver behavioral health care. He said these challenges and disparities remain today 20 years later, particularly with respect to access to mental health services and the quality of the services provided. He noted NAMI’s commitment to addressing these disparities. He also discussed issues with the lack of precision in diagnosing mental health disorders. He concluded his remarks by underscoring how important it is for providers to be trained in cultural competence to recognize and treat mental health disorders in traditionally underserved groups. He also discussed the challenges with mental health parity compliance and enforcement, given that it is typically complaint driven. He suggested that consumer education is key. He also noted that the CAA could help in this effort because of the involvement of employers in the comparative analysis assessments instead of consumers who may not have the ability to understand the complexity of the parity law to determine if there is a violation and file a complaint. He pledged NAMI’s assistance in helping the Working Group work on its proposed new 2021 charge, particularly in assisting the Working Group to invite diverse voices to speak during its future meetings to gain the perspective of racial and ethnic minorities in the country.

Jennifer Nowak (BCBSA) said Blue Cross Blue Shield (BCBS) companies are committed to improving the quality of care, while providing access to effective treatment for substance use disorders. The BCBSA has been developing centers of excellence programs for over 30 years, always with a strong focus on quality and evidence-based care. Ms. Nowak said when the BCBSA began to develop its first center of excellence program focused on mental health/behavioral health, Blue Distinction Centers for Substance Use Treatment and Recovery (BDC SUTR), the BCBSA found that this is a very different landscape than medical and surgical health care, such as the extreme variations in the quality of care delivered and significant differences in providers using evidence-based treatments. These findings heightened the need to build a center of excellence program that enables BCBS members to find resources and identify and access quality providers using evidence-based treatments.

Ms. Nowak discussed the work of BCBS companies’ National Health Equity Strategy (Strategy), which aims to confront the country’s crisis in racial health disparities and intends to change the trajectory of health disparities and re-imagine a more equitable health care system. This Strategy includes: 1) collecting data to measure disparities; 2) scaling effective programs; 3) working with providers to improve outcomes and address unconscious bias; and 4) influencing policy decisions at the state and federal levels.

Ms. Nowak said this multi-year Strategy will focus on four conditions that disproportionately affect communities of color—maternal health, behavioral health, diabetes and cardiovascular conditions. She said the BCBSA will focus first on maternal health, and it intends to focus on behavioral health later this year. She said to assist it in working on the Strategy, the BCBSA convened a national advisory panel of doctors, public health experts, and community leaders to provide guidance.
Lastly, Ms. Nowak discussed BCBS plan examples to address health inequities and behavior health services, such as the Blue Shield of California’s partnership with ScaleLA Foundation, the Center for Youth Wellness, and the Compton Unified School District. The goal of this partnership is to develop and implement initiatives that fill behavioral health gaps in care for adolescents, teens and families in Compton and Premera Blue Cross’ development of public-private partnerships to fund capital grants supporting crisis care and stabilization and ensuring that people are treated at the appropriate level of care.

Ms. Dzurec noted that at certain points, maternal health can be mental health. As such, the BCBSA’s Strategy initiative to focus first on maternal health is not completely outside the Working Group’s focus at this point in its discussions, particularly when discussing integrated care. She asked for additional comments. Daniel Blaney-Koen (American Medical Association—AMA) discussed the disparities in access to and the provision of MH/SUD services for people of color. He discussed specific examples of the differences in treatment for people of color and whites having the same substance use disorder issues. He said this type of structural racism and other issues leading to disparities in treatment and services is pervasive throughout the health care system. He also said some of these disparities could be a result of parity issues in areas such as prior authorization requirements and inadequate provider networks. He offered suggestions for the Working Group to consider in looking at this issue, including the importance of collecting demographic data to pinpoint what problems are leading to this disparity.

Ms. Beyer asked Ms. Hathaway about the challenges plans have in trying to collect demographic data from plan enrollees and the extent of this information being available in state all-payer claims databases (APCDs). She noted that in discussing the data issue with Washington’s APCD, the APCD suggested linking with census tracks because census tracks include race and ethnicity demographic data. Ms. Hathaway reiterated the challenges plans have in obtaining the data from plan enrollees, including a plan’s ability to collect such data on a state-by-state basis. She suggested that the Working Group might want to first focus on the obstacles to obtaining the necessary demographic data and look at possibly utilizing APCDs later in the discussions. She said AHIP is asking how some of its members have been able to obtain demographic data at higher rates, and it is looking at potentially developing a set of best practices to assist all carriers in obtaining such data.

Ms. Dzurec asked Working Group members to submit any thoughts and/or suggestions concerning any research, tools and educational materials for the Working Group to consider as it moves forward with working on its proposed new 2021 charge.

Having no further business, the MHPAEA (B) Working Group adjourned.
The Senior Issues (B) Task Force met July 29, 2021. The following Task Force members participated: Marlene Caride, Chair (NJ); Lori K. Wing-Heier, Vice Chair, represented by Sarah Bailey (AK); Jim L. Ridling represented by Anthony L. Williams (AL); Evan G. Daniels represented by Steve Fekety (AZ); Ricardo Lara represented by Tyler McKinney (CA); Michael Conway represented by Peg Brown (CO); Andrew N. Mais represented by Paul Lombardo (CT); Karima M. Woods represented by Howard Liebers (DC); Trinidad Navarro represented by Susan Jennette (DE); David Altmairer represented by Chris Struk (FL); Colin M. Hayashida represented by Kathleen Nakasone (HI); Doug Ommen represented by Andria Seip (IA); Dean L. Cameron represented by Weston Trexler (ID); Amy L. Beard represented by Rebecca Vaughan (IN); Vicki Schmidt (KS); Sharon P. Clark (KY); James J. Donelon represented by Ron Henderson (LA); Gary D. Anderson represented by Kevin Beagan (MA); Kathleen A. Birrane represented by Joy Hatchette (MD); Eric A. Cioppa represented by Sherry Ingalls (ME); Anita G. Fox represented by Renee Campbell (MI); Grace Arnold represented by Jan Ludwigson (MN); Chloris Lindley-Myers (MO); Troy Downing represented by Ashley Perez (MT); Mike Causey represented by Tracy Biehn (NC); Jon Godfread represented by Yuri Venjohn (ND); Eric Dunning represented by Martin Swanson (NE); Chris Nicolopoulos represented by Roni Karris (NH); Judith L. French represented by Tynesia Dorsey (OH); Glen Mulready represented by Mike Rhoads (OK); Andrew R. Stolfi represented by Gayle Woods (OR); Jessica K. Altman (PA); Larry D. Deiter represented by Jill Kruger (SD); Carter Lawrence represented by Vickie Trice (TN); Doug Slope (TX); Jonathan T. Pike represented by Tanji J. Northrup (UT); Scott A. White represented by James Young (VA); Mike Kreidler (WA); Mark Afable represented by Jennifer Stegall (WI); and James A. Dodrill (WV). Also participating were: Eric Anderson (IL); Bob Williams (MS); Bogdanka Kurahovic (NM); Martin Wojcik (NY); Andrew Dvorine (SC); Brenda R. Clark (VT); and Mavis Earnshaw (WY).

1. **Adopted its June 8 Minutes**

The Task Force met June 8 and took the following action: 1) adopted its Feb. 23, 2021, and Oct. 20, 2020, minutes; and 2) discussed an article on bundling Medicare Supplement and Short-Term Care.

Ms. Kruger made a motion, seconded by Ms. Biehn, to adopt the Task Force’s June 8 minutes (Attachment One). The motion passed unanimously.

2. **Adopted the Report of the Long-Term Care Insurance Model Update (B) Subgroup**

The Long-Term Care Insurance Model Update (B) Subgroup met July 15, May 27, May 6, and April 22. During its July 15 meeting, the Subgroup heard from stakeholders on the current long-term care insurance (LTCI) marketplace and what products are being seen, filed, and produced in the marketplace. During its May 27 meeting, the Subgroup completed its cursory review of Sections 8 through 14 of the Long-Term Care Insurance Model Act (#640). During its May 6 meeting, the Subgroup completed its cursory review of Sections 1 through 7 of Model #640. During its April 22 meeting, the Subgroup discussed the agenda, format, and procedures for its work in the coming year.

Mr. Henderson made a motion, seconded by Ms. Kruger, to adopt the report of the Long-Term Care Insurance Model Update (B) Subgroup, which included its July 15 minutes (Attachment Two). The motion passed unanimously.

3. **Discussed Other Matters**

Commissioner Caride asked if there are any other matters or issues to be raised before the Task Force. Mr. Henderson raised an issue about Medicare cold calling. He said Medicare beneficiaries in Louisiana are getting lots of cold calls from outfits, whom are not agents, but refer the beneficiary to an agent. He said the outfit appears to be out of Florida. He said many of these beneficiaries are changed into a different health plan that is not helpful and, in some cases, detrimental to their needs. He said he received a call because his mother’s Medicare is attached to his cellphone. He said the Louisiana Department of Insurance (DOI) and the State Health Insurance Assistance Program (SHIP) have been working hard to help these beneficiaries and get them back into their original plans. He asked if other states have experienced a rash of cold calls.

Commissioner Caride said she has not been made aware of or is aware of any increase in cold calls in New Jersey. She asked if other states had any experiences.
Mr. Swanson said the Antifraud (D) Task Force members have been participating in monthly regulator-only meetings concerning the improper marketing of health plans. He said Nebraska has prosecuted one of these outfits. He said the cold call came to an attorney who had worked at the Nebraska DOI 50 years ago. He said if Louisiana would like to raise this before the next monthly regulator-only meeting, he would send Mr. Henderson the information about the next meeting.

Mr. Henderson said he will provide his and other information to David Torian (NAIC) to share with Mr. Swanson. Commissioner Caride asked Mr. Torian to inform Task Force members of the day and time of the next monthly regulator-only meeting on the improper marketing of health plans.

Bonnie Burns (California Health Advocates—CHA) said both SHIP and Senior Medicare Patrol (SMP) have been dealing with this issue for years, and they work with the federal government to prosecute these outfits, presuming they are not out of the country. She suggested that some of SHIP could present before this monthly regulator-only meeting on the improper marketing of health plans.

Having no further business, the Senior Issues (B) Task Force adjourned.
The Senior Issues (B) Task Force met June 8, 2021. The following Task Force members participated: Marlene Caride, Chair (NJ); Lori K. Wing-Heier, Vice Chair, represented by Sarah Bailey (AK); Jim L. Ridling represented by Anthony L. Williams (AL); Evan G. Daniels represented by Steve Fekety (AZ); Ricardo Lara represented by Tyler McKinney (CA); Michael Conway represented by Peg Brown (CO); Andrew N. Mais represented by Paul Lombardo (CT); Karima M. Woods represented by Howard Liebers (DC); Trinidad Navarro represented by Susan Jennette (DE); David Altmairer represented by Chris Struk (FL); Colin M. Hayashida represented by Kathleen Nakasone (HI); Doug Ommen represented by Andria Seip (IA); Dean L. Cameron represented by Weston Trexler (ID); Amy L. Beard represented by Rebecca Vaughan (IN); Vicki Schmidt (KS); Sharon P. Clark (KY); James J. Donelon represented by Ron Henderson (LA); Gary D. Anderson represented by Kevin Beagan (MA); Kathleen A. Birrane represented by Joy Hatchette (MD); Eric A. Cioppa represented by Sherry Ingalls (ME); Anita G. Fox represented by Renee Campbell (MI); Grace Arnold represented by Jan Ludwigson (MN); Chlora Lindley-Myers (MO); Troy Downing represented by Ashley Perez (MT); Mike Causey represented by Robert Croom (NC); Jon Godfried represented by Yuri Venjohn (ND); Eric Dunning represented by Martin Swanson (NE); Chris Nicolopoulos represented by Roni Karnis (NH); Judith L. French represented by Tynesia Dorsey (OH); Glen Mulready represented by Mike Rhoads (OK); Andrew R. Stolfi represented by Gayle Woods (OR); Jessica K. Altman (PA); Larry D. Deiter (SD); Carter Lawrence represented by Vickie Trice (TN); Doug Slape (TX); Jonathan T. Pike represented by Tanji J. Northrup (UT); Scott A. White represented by James Young (VA); Mike Kreidler (WA); Mark Afable represented by Jennifer Stegall (WI); and James A. Dodrill (WV). Also participating were: Eric Anderson (IL); Bob Williams (MS); Bogdanka Kurahovic (NM); Martin Wojcik (NY); Andrew Dvorine (SC); Brenda R. Clark (VT); and Mavis Earnshaw (WY).

1. Adopted its Feb. 23 and Oct. 20, 2020, Minutes

Director Lindley-Myers made a motion, seconded by Mr. Henderson, to adopt the Task Force’s Feb. 23 (see NAIC Proceedings – Spring 2021, Senior Issues (B) Task Force) and Oct. 20, 2020 (see NAIC Proceedings – Fall 2020, Senior Issues (B) Task Force) minutes. The motion passed unanimously.

2. Heard a Presentation on Bundling Medicare Supplement and Short-Term Care Insurance

Commissioner Caride introduced Ken Clark (Milliman) and Robert Eaton (Milliman) to discuss their article. Mr. Eaton said he and Mr. Clark looked at both products, Medicare Supplement (Medigap) and short-term care (STC); where it may make sense to bundle the sale of these products; and what the benefits of such bundling would be. He said looking at the long-term care (LTC) product, including the newer STC products, they are triggered by the inability to do activities of daily living (ADLs). He said both have steep claim costs curves, and people need the benefit a lot more later in life. He said the pricing of these LTC products hinges on key actuarial assumptions, such as lapse assumption, which is critical. He said he and Mr. Clark believe a company may benefit from having both these policies sold to the same policyholder. He said if you look through the list of key risks for all these policies, such as persistency, morbidity and selection risk, the joining of these products may be beneficial to both the insurer and the consumer policyholder.

Mr. Eaton said the article looks at the hedging of risks of combining these two products. He said if looking at other products that hedged the risks by combining (e.g., LTC and life insurance), the increasing sales of the combined product (e.g., the natural hedging of risks with mortality) is a positive. He said he and Mr. Clark believe this could be done with STC and Medigap, where the policyholder is given an incentive to buy these policies at the same time through something like a discount and recognizing that purchasing together means a better risk profile and the insurer is able to offer a lower price on the STC policy. He said he and Mr. Clark believe a company may benefit from having both these policies sold to the same policyholder. He said if you look through the list of key risks for all these policies, such as persistency, morbidity and selection risk, the joining of these products may be beneficial to both the insurer and the consumer policyholder.

Mr. Eaton said the article looks at the hedging of risks of combining these two products. He said if looking at other products that hedged the risks by combining (e.g., LTC and life insurance), the increasing sales of the combined product (e.g., the natural hedging of risks with mortality) is a positive. He said he and Mr. Clark believe this could be done with STC and Medigap, where the policyholder is given an incentive to buy these policies at the same time through something like a discount and recognizing that purchasing together means a better risk profile and the insurer is able to offer a lower price on the STC policy. He said he and Mr. Clark wrote the article to illustrate a case study of the potential advantages—i.e., intern the volatility of future earnings—for a company that offers both these products combined.

Mr. Clark said health arena Medigap and STC are kind of unique in that they are both priced on a lifetime basis versus Medicare Advantage or commercial business insurance. He said if a carrier wants to be profitable and competitive with Medigap, they really need good persistency, which is at odds with STC models where too good persistency could result in potential losses. He
said he and Mr. Eaton used a simple case study of a carrier having both products and selling them together, showing that there would be some crossover in terms of membership of both products. He said under the current regulatory environment, it would not be possible to actually create a hybrid-type product. He said nothing like that exists today.

Commissioner Caride asked if there were any questions. Mr. Lombardo asked Mr. Eaton and Mr. Clark to talk more about the loss ratios for both products. He said they mentioned that both products are priced on a lifetime concept, and that is true for LTC and STC; but for Medigap, there are fairly quick durational loss ratio requirements by plan, so he asked if they could provide more background on lifetime loss ratio pricing for Medigap.

Mr. Clark said in their case, they assumed Medigap as an attained age product; but even so typically, there is a durational pattern for Medigap. He said depending on the state and what is allowed in the state, there can be a durational component of loss ratio; but it is definitely flatter than what is assumed for STC products, and they typically level out at a point in time for Medigap. He said even if the loss ratio increases, it does not increase the magnitude of STC products.

Commissioner Caride asked about the pricing for the consumer and how affordable it would be for the consumer. Mr. Eaton said an average stand-alone STC policy may be about $800 to $900 a year; but overall, it would probably be south of $1000 a year and north of $500 a year. Mr. Clark said to keep in mind that Medigap rating, like STC, will go up by age; but the ballpark range would be about $150 to $250 a month. He said that would be for middle range, not necessarily something all-inclusive, and of course it would vary by state.

Commissioner Caride asked if there is a chance that the consumer may be paying double for service of the crossover benefits. Mr. Eaton said one of the reasons they like this pairing of Medigap and STC is that STC usually picks up where original Medicare leaves off; at least in terms of facilities days. He said this is why there is a kind of prevalence of a 90-day elimination period and LTC or STC come in after Medicare. He said there may be some overlap in the benefits; but generally, they are usually separate.

Commissioner Caride said she asked this because she had an incident of a company wanting to offer a product already offered in Medigap and charge seniors for that when there was no reason to do that. Mr. Clark said as long as the STC product is just for custodial care and there are no other bells and whistles, then he does not believe there would be a crossover.

Mr. Trexler asked if this could be structured as an innovative benefit for Medigap. Mr. Clark said in his opinion and from a regulatory point of view of what would be allowed, it seems that innovative benefits are intended to be little or small additional benefits. He said if it were added as an innovative benefit, it would be half or almost as big as the Medigap benefit itself. He said some states obviously do not allow innovative benefits, so it would not be possible to be done nationally; but if a state wanted to, it would be hard because it would be difficult to add an innovative benefit that large. Mr. Trexler agreed that the usual innovative benefit is for vision or dental; but he asked whether from what they are describing with STC products, none of that is duplicative with Medicare or Medigap. Mr. Clark said no as long as it is just custodial, such as home care or nursing care. Mr. Eaton said this is one of the paths forward to solve the LTC and STC risk issues. He said there is a lot of coverage for the first 90 days in the skilled nursing facility after an inpatient stay, then that risk for any of those long-term needs is transferred to the policyholder. He said some of them may have an LTC policy of a hybrid combo product, but the incentives are created when a carrier is incentivized to deliver the best care to the policyholder, whether they are kind of within the first 90 days or after that. He said he believes there is some benefit in a confluence of incentives to have that managed in some part by a single entity, but an entity to be at risk for both portions for someone’s LTC stay.

Mr. Trexler asked if Mr. Clark or Mr. Eaton are aware of companies that offer both Medigap and STC or if they are usually different types of companies. Mr. Clark said both he and Mr. Eaton are aware of companies. He said there are more Medigap carriers than STC carriers, but they both know of companies.

Mr. Sundberg said he had two questions. He said his first question was whether Mr. Clark and Mr. Eaton are thinking of a particular plan to pair this bundling. He said Plan A does not cover nursing home benefits and have generally higher premiums because of other regulations around it. He said his second question was whether they intended for companies to only offer the Medigap product to the folks that get the STC type option, because in his experience over time, the Medigap rates for a company can become stale and no longer marketable to the general public. He said that can take a cycle of five years, but limited LTC or STC companies usually have those rates available for five to 10 years and do not need a lot of manipulation afterward unless there are larger changes. He asked what happens if the Medigap rates are no longer palatable, but the STC product is still palatable. Mr. Clark said he and Mr. Eaton us Plan G in their case study. He suggested starting out with understanding that these are two products priced on a stand-alone basis and that there may be a program of bonus incentives to agents and encouraging the bundling, but the underlying premise is that these are two separate product lines appropriately priced on a
stand-alone basis. He said when it comes to rate actions, he presumes that the Medigap product would go through their normal rate filing increases. He said within each product line, there will be some membership that has both products as policies, and there will be some that only have Medigap policies. He said from an actuarial point of view, the overall rate level needs to be adequate in total, but if pointing out how some carriers might close out blocks of business or sell under a different carrier, that is an issue and a very good point.

Mr. Lombardo asked how a Medigap policy and an STC policy being sold by the same company to an individual when they sign up for Medigap and the individual wants to change Medigap carriers affects the individual’s STC policy. Mr. Eaton said one way to envision this is if there was a small discount offered on the STC premium when the products are purchased together, and in that case, the discount may go away, but the STC coverage could continue to stay over. He said a company may decide that the discount is worth keeping and the idea is to kind of incentivize them to the policies together because there are benefits of having both together.

Commissioner Caride asked questions from the chat box, and the first was from Jeffrey M. Klein (McIntyre & Lemon PLLC) asking how deductibles and copayments would be treated with a combined product. Mr. Eaton said they would be handled independently, and the products would each continue to function similar to the stand-alone product; so if one has a deductible for Medigap and they already collected some benefits under STC, the same deductible would continue to apply for the Medigap policy.

Commissioner Caride asked another question from the chat box from Harry Ting (Consumer Advocate Volunteer, Chester County Department of Aging Services – Apprise Program), who asked whether a consumer would be able to purchase the short-term policy later than the supplement (e.g., the supplement at age 65 and the short-term policy at age 75). Mr. Eaton said that is a very good question and he had not contemplated that. He said he does not think that means a company would not be able to do this if, for example, the policyholder already owns a Medigap policy and they want to purchase an STC policy many years later. He said the underwriting would get more difficult the older they get for STC because they would be closer to the age of when they need that care. He said he does not see why it could not be done, but it was not envisioned for the purposes of the article; it was still a great question.

Bonnie Burns (California Health Advocates—CHA) said the Medicare benefit for skilled nursing care is not an easy benefit to get and very few people ever get the full 90 days. She said the average number of days is around 20 days. She said she can see the benefit for companies, but she has a much harder time seeing the benefit for consumers. She said these STC policies have a higher threshold for benefits. She said they can use three ADLs as opposed to two; they have a much lower loss ratio requirement, at 50%; and they often have the same deductible period that LTC does. She said what she has seen with these products is that they are sold in 90-day increments, so people buy benefits for 90 days. She said that is a question of value given the premium. She said if they have a 90-day waiting period and then 90 days of benefits, that seems to be a very questionable benefit for the value related to the premium. She said she is very concerned about any product that is linked to a Medigap in a way that could potentially jeopardize the health care coverage of that individual. She said she wants to interject a little reality about how these policies have been sold, the amounts of coverage, and having a higher threshold for benefits may mean that people are going to have a much harder time getting coverage for their care.

Commissioner Caride asked a question from the chat box from Silvia Yee (Disability Rights Education and Defense Fund—DREDF), who asked if Mr. Clark or Mr. Eaton ever see policies as being in potential conflict. For example, the short-term policy could be drawn down for a period of personal care at home for a few weeks or for more expensive rehab hospital care; and if the short-term policy claim is denied, it increases the chances of a fall in the home that would result in medical claims. Mr. Eaton said that is a good question, and he thanked Ms. Burns for her good observations. He said the reason he and Mr. Clark believe these products may potentially go together quite naturally is that there is very little overlap in the benefits. He said there may be situations where if a claim in one is denied, it makes it tougher for the other; but he believes there is a kind of net gain even if there may be some cases where someone does not end up qualifying for the benefits according to the contract. He said these kinds of incidents are something all companies would want to be aware of when approaching this kind of market; and when selling these products together, they are very clear on the coverages, what that really means, and how they work together or how they do not work together when they are just independent.

3. Discussed Other Matters

Commissioner Caride asked if there are any other matters or issues to be raised before the Task Force. None were heard.

Having no further business, the Senior Issues (B) Task Force adjourned.
The Long-Term Care Insurance Model Update (B) Subgroup met July 15, 2021. The following Subgroup members participated: Philip Gennace, Chair (NJ); Laura Arp, Vice Chair (NE); Mayumi Gabor (AK); Tyler McKinney (CA); Roni Karnis (NH); Jill Kruger (CT); Susan Jennette (DE); Benjamin Ben (FL); Teresa Winer (GA); Jason Asaeda (HI); Andria Seip (IA); Kathy McGill (ID); Eric Anderson (IL); Scott Shover (IN); Craig VanAalst (KS); Ron Kreiter (KY); Fern Thomas (MD); Sherry Ingalls (ME); Karen Dennis (MI); Fred Andersen (MN); Amy Hoyt (MO); Bob Williams (MS); Ashley Perez (MT); Ted Hamby (NC); Yuri Venjohn (ND); Bogdanka Kurahovic (NM); Sean Becker (NY); Tynesia Dorsey (OH); Cuc Nguyen (OK); Jim Laverty (PA); Andrew Dvorine (SC); Vickie Trice (TN); Chris Herrick (TX); Mary Block (VT); Julie Walsh (WI); Dena Wildman (WV); and Mavis Earnshaw (WY).

1. **Adopted its May 27 Minutes**

The Subgroup met May 27 and took the following action: 1) adopted its May 6 minutes; and 2) discussed comments received on Sections 8 through 14 of the Long-Term Care Insurance Model Act (#640).

Ms. Kruger made a motion, seconded by Ms. Karnis, to adopt the Subgroup’s May 27 minutes (Attachment Two-A). The motion passed unanimously.

2. **Heard Presentations on the Current LTCI Marketplace and What Products Are Being Seen, Filed and Produced in the Marketplace**

Karen Schutter (Interstate Insurance Product Regulatory Commission—Compact) began with a little background about the Compact. She said the Compact was created in the early 2000s in response to the threat of federal preemption. She said what are called asset-based or retirement protection products are long-term care (LTC) products. She said regarding life annuity and disability income that compete with the federally regulated products, like banking and securities, there was a call for more efficiency in terms of speed to market and uniformity. The Compact became a solution of the states to come together and develop what is called uniform standards.

Ms. Schutter said the Compact statute ties the LTC uniform standards to NAIC model law and regulation. She said the standards shall provide “same or greater protections for consumers as but shall not provide less than” the NAIC models, including subsequent amendments. She said the uniform standards were amended in 2017 to incorporate 2016 amendments to NAIC Models #640 and the Long-Term Care Insurance Model Regulation (#641). She said the Compact has qualified actuaries and form reviewers, many who came from insurance departments. She said the review of a product, including LTC, come under detailed uniform standards. She said although some states have opted out in terms of LTC, those states that are participating in LTC follow the 10 standards the Compact has, and those standards were built off of the LTC model regulation.

Ms. Schutter said the scope of products reviewed include products advertised, marketed, or offered to provide benefits for one or more of the following: nursing home care, assisted living care or home health care, and adult day care. She said the LTC insurance definition follows the Model #640 definition, and the LTC insurance (LTCI) definition excludes life policies that accelerate death benefits for chronic illness or annuities with guaranteed living benefits when the guaranteed withdrawal increases for certain events. She said the standards for accelerated death benefits (ADBs) do not apply to the products/riders within scope of LTC policy standards. She said the Compact follows Model #640, and when the model was updated several years ago, the Compact opened its standards and updated them at that time.

Ms. Schutter said the Compact makes sure the uniform standards apply broadly, and many states treat LTC as a health product. She said the Compact’s standards are clean. She said they cover the LTC product and if a product is being advertised, marketed, and offered to provide LTC benefits, or pay for LTC services, it falls under the LTC standards. She said the uniform standards for LTC policies and rate schedules specifically cover stand-alone traditional LTC policies and rates; riders and rates to ADBs of life insurance policies or annuity contracts, defined as “dollar for dollar LTCI”; and riders and rates to extend LTC benefits after exhaustion of policy death benefits/annuity account value, defined as an extension of benefit rider.
Ms. Schutter said the Compact has approved a large number of products, with some as dollar-for-dollar riders, others under universal life products, and others attached to whole life products. She said there are some that come from annuities. She said extension of benefit riders are treated differently even though those riders go with LTC. She said in many ways, they operate as stand-alone as they have their own rate schedule. She said the Compact standards are based off the rate stability framework from Model #641. She said the Compact wants to serve as a resource and that the uniform standards are more detailed than the model regulation.

Ms. Schutter highlighted the differences between the Compact’s standards and the model regulation. She said the benefit trigger cannot be more than two activities of daily living (ADLs); the exclusion based on mental or nervous disorders is not permitted; the exclusion due to a preexisting condition or disease is limited to loss occurring within six months; the coordination of benefit provision is not permitted; there must be a product offered with inflation protection; there must be a product offered with issue age rates; there must be a product offered with home health care benefits at 100% of nursing home benefits; and for home health care benefit options, there must be a coverage requirement of 50% of nursing home benefit minimum.

Ms. Schutter said that the Compact takes no position on changes to Model #641 to accommodate designs that have been requested by the industry, and the Compact is happy to provide reviewer and actuarial resources for technical assistance. She said the Compact publishes an annual report on Compact-approved iLTCRate Schedule Certifications, and it provides a state-specific report to each Compacting state on iLTCproducts/riders and annual rate certifications.

Ms. Ahrens asked for clarification about rate increase requests and new business schedules. Ms. Schutter said the Compact does not call it a rate increase but a refresh of new business or a new business schedule. She said the Compact does see companies that are still in the market and cannot certify the sufficiency of their rates; they will have to come in with a new business schedule. She said she does not know if the Model #641 talks about new business rate schedules as it may need to.

Ms. Ahrens said Model #640 or Model #641 states that an insurance commissioner can modify or bypass any requirement of the regulation for innovative products with a hearing, and she asked what the Compact does with a state that does that. Would the Compact recommend to the state to opt out of LTC since those provisions would be for product innovations that are not allowed in the current model? Ms. Schutter said the uniform standards are intended to put parameters around the products the Compact can review so that state insurance regulators know what products are coming in, and those innovative products are ones that the standards do not accommodate today. She said there is an action item in the strategic plan the Compact developed a couple years ago to coordinate with states to facilitate if there are innovative designs, but that would start at the state level, and the Compact would play a coordinating role. Ms. Ahrens asked about the non-duplication benefit and said that the Compact really could not help companies with that issue. Ms Schutter said the Compact thinks this was a public policy issue and that perhaps this could be an issue for this Subgroup.

Birny Birnbaum (Center for Economic Justice—CEJ) asked if there is evidence of the use of the mix-and-match tool when the company rejects a rate filing on the policy form and asked for clarification about the new business schedule, whether there is a requirement for a new policy form, or whether a company can simply have a new schedule for an existing policy form. He said the latter would seem to be unfairly discriminatory. Ms. Schutter said the Compact does not allow for mix-and-match among the LTC component so that under a traditional product, everything would have to be filed through the Compact. She said she has not seen any anecdotal evidence or information on the rider side. She said for the new business schedule that is in the standards and allows a company to come in on the same product and get a new business, that is only for new business going forward, and it is to stabilize the rates for anybody purchasing that product after a date certain.

Jan Graeber (American Council of Life Insurers—ACLI) said she will speak to the industry perspective with respect to the evolving LTC market. She said according to the U.S. Department of Health and Human Services (HHS), more than half of Americans turning 65 today will need some type of LTC, and more than 20% will likely need care for five or more years. She said there are 10,000 Americans turning 65 every day, and the median cost for a one-year stay in a private nursing home room is more than $100,000. She said a recent study by the Boston College Center for Retirement Research (CRR) showed that about 20% of retirees will need no support, and about 25% are likely to experience severe needs. She said in between these extremes, 22% will have low needs, and 38% will have moderate needs. She said those needs will vary by marital status, education, and health.

Ms. Graeber said there is a misconception by some that the private LTCI market has collapsed. She said millions of Americans are covered by private LTC insurance today. She said ACLI members paid out nearly $12 billion in LTCI claims in 2019 and that consumers find private LTC coverage to be invaluable. She said there is a growing hybrid LTC market and a growing interest in state and federal LTC initiatives and programs. She said examples of the state and federal LTC initiatives and
programs include what is being done in Washington state and California, as well as the federal Well-Being Insurance for Seniors to be at Home (WISH) Act.

Ms. Graeber said Washington state passed the first public operated LTC program in 2019. She said the program is funded by a payroll tax, and in January 2022, all W-2 employees in the state will be assessed at 0.58% premium assessment based on their wages. Employers must cover this premium assessment through a payroll deduction. She said the proceeds are put into a state trust account, which is the WA Cares Fund, and that is going to be used to pay for people who need LTC in the future. She said self-employed and federal employees are exempt from the mandate. She said when an individual triggers the eligibility for benefits under the Washington state plan, the fund will then pay out a maximum of $36,500. The plan will require an inability to perform three out of 10 ADLs in order to receive a benefit. She said if an employee leaves the state, he or she will not receive any LTC benefits, and the taxes that were taken from his or her income will not be returned.

Ms. Graeber said under the federal WISH Act, workers and their employers must each contribute 0.3% of wages, and these contributions will find a new LTCI trust fund that will provide catastrophic LTC benefits. She said the WISH Act also contains educational provisions to help seniors and their families understand the likelihood of requiring LTC, the costs of that, and the options for paying for it. She said these proposals and initiatives are well intentioned, but they provide limited benefits. Ms. Graeber said it is critical that any new government-run program coordinate and build upon the existing foundation of the private LTCI market. She said one priority is to ensure that state or federal plans are compatible with existing private market, eligibility rules and benefit periods, and it may be useful to explore public and private partnerships where states could design an LTC program that synchs up with the private LTC plans, and then that provides a seamless transition of care that really would leave no gap and coverage.

Ms. Graeber said looking at the current model, there are several issues or areas to focus on that could determine the model’s flexibility and ability to remain compatible. She said the inclusion of a non-duplication of benefit provision would be helpful in getting people to start purchasing coverage at age 40 instead of age 60. She said a non-duplication of benefit provision would allow a carrier to sell or issue new or secondary coverage, maybe every five years, in order to allow the consumers to build their plan over time. The secondary average would have, instead of the 90-day or 180-day elimination period, maybe a two- or three-year elimination period. She highlighted other opportunities, such as: inflation protection requirements; flexibility in pricing and benefit structure; the ability to provide a cash value in stand-alone LTC; opportunities to age-in-place; and reviewing some consumer protections in light of the changing market, such as agent education and training.

Mr. Birnbaum said he opposed many of the proposals the ACLI mentioned and strongly believes consumer protections in the slides should not have been presented with quotation marks around the word “protections.” He said these protections are not fake but are real consumer protections. He said the solution to inadequate producer training for universal life is not to lower the standards but to improve the training. He said it is critical to consumer protection to make the inflation offer an opt-out, not an opt-in. He also said the non-duplication of benefits and flexible premiums are already an extraordinary complex product, and the ACLI proposals would take an extraordinarily complex product and make it even more complex and difficult to understand. He said the goal is not to create more complexity and more opportunities for the consumer to misunderstand; rather, it is to simplify the product so that it is easier for the consumer to understand.

Ms. Ahrens said she has a document will bullet points she will share with the Subgroup. She said she was going to break down the product innovations that she has seen, and those comments would be general. She said she would next address management that companies are allowed to do on enforced rate increases and reduced benefit options (RBOs). She said she would address the life stage product in Minnesota. She said it is a Minnesota project with input from the Society of Actuaries (SOA), and surveys were conducted of Minnesota residents and citizens asking if they could buy LTC, what would it look like and what would their primary considerations be. She said one of the biggest goals for the development of the project was to find a way to reach more of a middle market since stand-alone LTC can be expensive. She said through that inquiry process, a concept was developed called a life stage project. She said that it is a concept and not a public program. She said since it is a term product that converts to LTC at age 65, it would not meet the approval standards under the Compact. However, she said that the state is examining language that could make it approvable. Minnesota sees the concept filling a need to serve more of the market and gives people an opportunity to have a valid life insurance product while pre-funding LTC before it is needed.

Ms. Ahrens said both the Washington state program and the WISH Act are limited in benefits, pointing out that the Washington state program goes into effect next year and the WISH Act was just introduced in Congress and is not going to be law any time soon. She said the Washington state program is a $100 per day, one-year benefit plan. Checking prices and rates in Lincoln, NE, and Omaha, NE, the nursing care rate is about $250 per day and, if comparable to Washington state, the person would pay half the costs. She said the WISH Act is catastrophic care and pays only after certain triggers have been met. She said there
would be limitations on industry on a stand-alone LTC product because there cannot be an elimination period longer than one year. So, if Washington state covers a year, then there is a stand-alone product issue where there cannot be duplication of benefits because companies have to cover benefits before a year has expired.

Ms. Ahrens said the question for the Subgroup is whether to open the model now and whether the work would be done on the model as long as there are states that have these public programs. She asked if the model would have to be opened again or wait until these programs are approved and have had some time to move forward in the event there are reasons to edit the model that have not been thought of prior to these public programs. She said it is important to be aware that there are companies that will pull out of the market and that she is aware of two that have pulled out of Washington state, at least temporarily, as Washington state has an opt-out provision from the payroll tax if one has his or her own LTC.

Ms. Ahrens said she would discuss the RBO and said Section 27 of Model #641 requires companies to allow an insured to reduce their benefits. She said those reductions have to be fair and reasonable, but there is nothing in Model #641 that says there cannot be different benefit reductions than what exists in the original rate schedule. She said she does not think it is necessary to open Model #641 to deal with the RBO, but if the model is to be opened, then everything should be looked at.

Ms. Ahrens said when companies innovate, they say they have a guaranteed renewable rate, rates are changed in the future, that is one of the management tools available. She said if the companies do not know how states are going to review their rates and they do not know if there is going to be uniformity, then the companies cannot make a decision on whether to enter the market or stay in the market. She said that is one of the reasons why there have been fewer companies willing to issue new business. She said if there is to be new business issued, there has to be thought about how to coordinate and add uniformity across states. She said if there is a way to do that within the LTC models, that can be explored. But if there is anything related to rates, there has to be no exacerbation of the lack of uniformity.

Ms. Ahrens said companies have always offered RBOs so that if a policy has, for example, eight years in lifetime benefits, the policyholder could reduce his or her benefit in any year and not have to wait for a rate increase, and the company would have to allow it. She said recently, in the past five to seven years, companies started to reason there may not be enough choices, and there may be more ways to offer the policyholders to manage their risk and the companies started to innovate RBOs, such as riders to policies that, upon a rate increase, allow for more options. She said an example is where a company uses the inflation there may be more ways to offer the policyholders to manage their risk and the companies started to innovate RBOs, such as riders to policies that, upon a rate increase, allow for more options. She said another example is a shared care concept where the benefit is, for example, $100 per day; the premium rate does go up because he or she is paying a higher rate for a lower benefit but that the policyholder is paying the same number of dollars. She said another example is a shared care concept where the benefit is, for example, at $100 per day; the policyholder would pay 20%, and the company would pay 80%. She said these options have been found to be approvable under Model #641. She said she thinks more options are better than no options.

Bonnie Burns (California Health Advocates—CHA) said she would like to make comments to the some of the points that Ms. Graeber raised in her presentation, but due to lack of time, she will discuss what she has seen from the consumer perspective. She said there are many consumers who have many questions about what is happening to them in this LTC marketplace. She said there is no dispute that LTC is a vexing problem, it is not clear how to finance it, and everyone is struggling with these issues. She said consumers are struggling with the options given as part of rate increase. She said there are class action lawsuits and settlements that complicate matters for consumers as they navigate through the options. She said most of the questions from consumers are having to do with the options issue, the options that are presented to them, and having trouble understanding those options. She said another problem is consumers who have complicated financial products that they either were told to buy or have bought and how LTC works within that complicated financial product. She said these consumers are looking for information or advice or confirmation that they did the right thing buying such a product.

Ms. Burns said in other instances, consumers are coming with questions about claims, such as a family member asking about how to file a claim or a claim has been filed, but there are problems and lots of paperwork they do not understand. She said the challenge for consumer representatives is how to unwind LTC benefits from these complicated financial products in order to help the consumer understand how those benefits will work when they need them or if they need them now. She said these products are complex, based upon so many different life insurance platforms, that it is extremely hard for consumers to understand them. Ms. Burns said a year after they may have bought such a financial product, they will have forgotten the information someone had told them about the product. She said these products are mostly being sold to higher net worth clients because they are not feasible for a middle-income person looking for a way to finance this kind of care, and many of them are combining life insurance with investment and LTC benefits. She said it is a complicated process, and these products are poorly understood.
Ms. Burns said consumers do not understand that there are internal costs applied to the policy itself and will be applied to the benefit before it is actually paid. She said the only thing consumers really know about these financial products with the LTC benefit in them is that someone is going to get money either when one dies or when they need LTC. She said there is a multiplicity of life platforms now. She said a universal life policy can be an indexed policy, it can be a variable life policy, or it can be an indexed variable life policy. She said there are so many different ways that companies are combining these various benefits, and then they put LTC into them, which makes them even more complicated. She said these policies are not adequately addressed in the LTC models, and they compete with other ways of funding LTC because people are selling life settlements and reverse mortgages to pay for LTC.

Ms. Burns said the structure of these policies varies considerably, from accelerated death benefits and critical care policies to riders that may extend a LTC benefit one way or another. She said these are hard for consumers to understand. She said all of the pieces of these are complicated in and of themselves. She said the benefits payments vary from a reimbursement model that requires LTC services and payment and uses LTC triggers to indemnity payments, where there is no use of services required, but they may use the same triggers. Ms. Burns said it is hard for people to understand the difference between these products. She said these are not adequately addressed in Model #641, either in the definitions or in the performance standards sections of the model. She said consumers need to know the type of insurance platform that the LTC benefit is included in in order to understand how the policy works. She said consumers need to understand there are internal fees within the policy and that some are guaranteed, while some are not. She said consumers need to understand whether there are separate pools of money or whether all of the benefits for everything in that policy is combined in one pool of benefits. She said consumers need to understand if they have an annuity and a LTC benefit in that annuity or if that annuity payment changes when they need LTC and start drawing down on that benefit. She said consumers need to understand cash value and surrender charges and added that consumers do not understand the implications of those surrender charges.

Ms. Burns said making these policies more complex is not the answer. She said these products need to be simplified so the average person can understand what they are buying, how it works, and how they can use it in the future. She said they do not need the complexity of knowing or not knowing how rates are going to change in the future when they are going to actually need those benefits. Ms. Burns said these consumers are at a distinct disadvantage in making a decision about these complex financial products they bought to pay for LTC benefits. She said the complexity of the design and benefits, the reams of illustrations, and disclosures are not helpful to consumers for making decisions about purchasing coverage or using those benefits when they need them.

Ms. Arp asked Ms. Ahrens about how the Subgroup can get better educated addressing the changes in the market and whether the LTC models, as they stand now, still give what is needed and are broad enough to allow the flexibility to approve innovative options. Ms. Ahrens said she thinks there is the ability to approve innovative options for benefit reductions. She said there are the tools to work with the balance to the obligation of the company and the consumer and the risks that may be shared between them. She said she thinks state insurance regulators have the ability within the model to be open to what companies have tried, but it also may be that companies are only trying things that seem feasible through the model. She said, however, that on the innovation side of things, there is definitely room to expand.

Mr. Birnbaum said the flip side of states viewing the model as giving them the flexibility to address all sorts of innovations and approaches seems inconsistent with the other efforts of the NAIC, which is to develop more consistency and uniformity in LTC regulation among the states. He said to the extent that the model is flexible enough that states can interpret it differently and approve products in a different fashion is not useful and is inconsistent with the NAIC’s stated goals.

Ms. Ahrens said that is why she is an advocate for the multi-state review process in trying to create a platform for coordination or rate reviews, which includes benefit reduction reviews, and that platform would help apply the regulation consistently.

Having no further business, the Long-Term Care Insurance Model Update (B) Subgroup adjourned.
The Long-Term Care Insurance Model Update (B) Subgroup of the Senior Issues (B) Task Force met May 27, 2021. The following Subgroup members participated: Philip Gennace, Chair (NJ); Laura Arp, Vice Chair (NE); Sarah Bailey (AK); Tyler McKinney (CA); Roni Karnis (NH); Jill Kruger (SD); Tomasz Serbinowski (UT); and Elsie Andy (VA). Also participating were: Dusty Smith (AL); Andrew Greenhalgh (CT); Susan Jennette (DE); Martha Im (HI); Andria Seip (IA); Kathy McGill (ID); Christina Roy (IL); Alex Peck (IN); Craig VanAalst (KS); Ron Kreiter (KY); Jamie St. Clair (MD); Sherry Ingalls (ME); Renee Campbell (MI); Fred Andersen (MN); Carrie Couch (MO); Bob Williams (MS); Ashley Perez (MT); David Yetter (NC); Yuri Venjohn (ND); Jennifer Catechis (NM); Martin Wojcik (NY); Shannen Logue (PA); Mei Feng (TX); Mary Block (VT); Julie Walsh (WI); Joylynn Fix (WV); and Mavis Earnshaw (WY).

1. **Adopted its May 6 Minutes**

The Subgroup met May 6 and took the following action: 1) adopted its April 22 minutes; and 2) discussed comments received on Sections 1 through 7 of the Long-Term Care Insurance Model Act (#640).

Mr. McKinney made a motion, seconded by Ms. Kruger, to adopt the Subgroup’s May 6 minutes (Attachment Two-A1). The motion passed unanimously.

2. **Discussed Comments Received on Sections 8 Through 14 of Model #640**

Mr. Gennace said before beginning on the latter sections, he would like to hear from Mr. Serbinowski on whether he has more to comment on the issues of extraterritoriality. Mr. Serbinowski said if the current language is sufficient to address the certificates of group policies and rate increases, then the language should remain.

Birny Birnbaum (Center for Economic Justice—CEJ) said the language is not sufficient, and he cited the example he raised at the previous meeting. He said there needs to be clarification. Jan M. Graeber (American Council of Life Insurers—ACLI) said there are different types of products that are classified as group, such as true group. She said the model may not be specific, but the language is clear, and the states have the flexibility. Mr. Serbinowski said it may be useful to look at the question of why group long-term care (LTC) policies are still needed. Ms. Andy said language is still needed for group policies in existence today. Bonnie Burns (California Health Advocates—CHA) said group policies are used for marketing. She said employees believe the group policies are something different than what is out in the private sector. Ms. Logue said the reason why group sales come in with low benefits is to avoid anti-selection issues and offer a modified guaranteed issue product.

Mr. Gennace asked for comments on the consumer representatives’ comment on Section 8 of Model #640 on nonforfeiture benefits. Ms. Burns said the language ties the size of the premium increase to the age of the policyholder over time. She said it unfairly penalizes policyholders who are unable to continue funding an ever-increasing premium (e.g., a widow left with diminished income after their spouse’s death). She said she has not seen a lot of non-forfeiture, but no one should have to give up a policy that is paid for, and there should be options for policyholders should there be an income change. Mr. Serbinowski said the Subgroup may want to consider requiring that the non-forfeiture benefit be equal to the greater of premiums paid, and 30 days of benefits should be built (required, not optional) in every policy. He said it should not cost too much, because this is a fairly low benefit and lapse rates are very low anyway. Ms. Graeber asked Ms. Burns if she is looking for the ability to reduce coverage or terminate and pay the non-forfeiture and whether Section 22 of Model #641 would be of help. Ms. Burns said the reason why group sales come in with low benefits is to avoid anti-selection issues and offer a modified guaranteed issue product.

Mr. Gennace asked if anyone wished to discuss the consumer representatives’ comments on Section 9 of the Long-Term Care Insurance Model Act (#640). Ms. Burns said producers do not believe they need training or additional training since they are not selling long-term care insurance (LTCI). She asked if the term includes benefits in life and annuity products, and she said knowing and being able to explain the difference between free standing products for LTC and life and annuity-based products should be included for agents and brokers selling life or annuity-based products.
Mr. Gennace asked if anyone wished to discuss the consumer representatives’ comments on Section 13 of Model #640. Ms. Burns said the penalties are rather low and pointed out that some life and annuity commissions are above the current penalty level.

Mr. Gennace said he would inform the Subgroup of the next steps in terms of reviewing Model #641, and he asked if anyone had any further comments. Ms. Karnis informed the Subgroup of a New Hampshire Supreme Court decision in February that analyzed New Hampshire’s LTC rulemaking authority statute, which follows Section 10 in Model #640. She said the Court invalidated a New Hampshire rate cap administrative rule, which was not based on Model #640, but the rulemaking authority statute for LTC has the same language as the current Model #640 language. She said given the court case, the Model #640 language may continue to create questions in other states that are trying to provide consumer protection for policyholders before a large rate increase is implemented and updating those terms or clarifying the balance of how they work together would be recommended based on New Hampshire’s experience.

Ms. Karnis said it would be helpful to see what is currently out in the marketplace and what has evolved over time in relation to Model #640 and Model #641.

Having no further business, the Long-Term Care Insurance Model Update (B) Subgroup adjourned.
The Long-Term Care Insurance Model Update (B) Subgroup met May 6, 2021. The following Subgroup members participated: Philip Gennace, Chair (NJ); Laura Arp, Vice Chair (NE); Sarah Bailey (AK); Tyler McKinney (CA); Heather Silverstein (NH); Lisa Harmon (SD); Tomasz Serbinowski (UT); Bob Grissom (VA); and Michael Bryant (WA). Also participating were: Jennifer Li (AL); Andrew Greenhalgh (CT); Susan Jennette (DE); Teresa Winer (GA); Martha Im (HI); Cynthia Banks Radke (IA); Kathy McGill (ID); Karl Knable (IN); Brenda Johnson (KS); Ron Kreiter (KY); Adam Zimmerman (MD); Marti Hooper (ME); Renee Campbell (MI); Carrie Couch (MO); Bob Williams (MS); Ashley Perez (MT); Ted Hamby (NC); Angie Voegele (ND); Bogdanka Kurahovic (NM); Jack Childress (NV); Martin Wojcik (NY); Laura Miller (OH); Jim Laverty (PA); Sarah Neil (RI); Andrew Dvorine (SC); Vickie Trice (TN); Mei Feng (TX); Anna Van Fleet (VT); Julie Walsh (WI); and Tana Howard (WY).

1. **Adopted its April 22 Minutes**

The Subgroup met April 22 to discuss its work.

Ms. Bailey made a motion, seconded by Mr. Grissom, to adopt the Subgroup’s April 22 minutes (Attachment Two-A1a). The motion passed unanimously.

2. **Discussed Comments Received on Sections 1 Through 7 of Model #640**

Mr. Gennace asked Mr. Serbinowski to elaborate on his comments sent to the Subgroup. Mr. Serbinowski said he believes the scope section as well as the definition of long-term care insurance (LTCI) deserves a look. He said he has seen products that claim not to be long-term care (LTC) and are deemed not to be LTC by several states even though they would appear to meet the definition of LTC in the Long-Term Care Insurance Model Regulation (#641). He said most of the LTC policies sold today are combo products, and the Subgroup may want to revisit the parts of Model #641 that exempt life insurance policies that accelerate benefits for LTC.

Mr. Gennace said the Subgroup would go through the comments received from the consumer representatives to the first seven sections of Model #640. He asked if anyone wished to discuss the consumer representatives’ comments on Section 1 of Model #640. Bonnie Burns (California Health Advocates—CHA) said the focus of Section 1 is on the beginning of the process, but it does not address the issue of claims and other factors during the process. She said so many LTCI benefits are attached to life insurance products, and Section 1 does not address any of these products, which leads to a lot of confusion.

Karrol Kitt (University of Texas at Austin) said Section 1 is not broad enough and needs to be more inclusive of newer products. Brenda J. Cude (University of Georgia) said the thought expressed in the drafting note to Section 1 should be expressly incorporated into the section.

Mr. Gennace said the Subgroup would go through the comments received from the consumer representatives to the first seven sections of Model #640. He asked if anyone wished to discuss the consumer representatives’ comments on Section 2 of Model #640. Ms. Burns said the section does not make it clear that limited LTCI products exist and there are models; i.e., the Limited Long-Term Care Insurance Model Act (#642) and the Limited Long-Term Care Insurance Model Regulation (#643). She said the reference to Medicare supplement in Section 2 is still included even though home recovery is no longer sold. Mr. Grissom asked Ms. Burns to elaborate on why Model #642 and Model #643 should be mentioned or referenced in Model #640. Ms. Burns said Section 2 requires insurers to comply with all other applicable statutes, and limited LTCI competes with traditional LTCI.

Mr. Gennace asked if anyone wished to discuss the consumer representatives’ comments on Section 4 of Model #640. He said the consumer representatives’ comments on Section 4 said there are no definitions, reference to or description of a reduced benefit option (RBO) or the full scope and range of RBOs that might be offered to policyholders. He said the comments further reflect that while there is some language in Model #640 about the right to reduce benefits, there is neither anything in Model #642 or Model #643 that describes or defines all of the potential options insurers can give policyholders as a way to reduce the effect of a rate increase, nor is there anything that specifies how, when, or under what circumstances these options have to be offered.
Mr. Serbinowski said this section may be something the Subgroup should look at. He said there are several products in the marketplace that could arguably be LTC but are not deemed LTC. He reiterated that as most LTC policies are combo products, revisiting the parts of Model #640 that exempt life insurance policies that accelerate benefits for LTC may be necessary. He said some issues with these exemptions are: 1) it is not always clear how the prohibition against LTC premiums increasing above age 65 should be interpreted; 2) if a state does not regulate premiums on the underlying life product, adverse LTC experience could be passed on to the policyholders through the increase of the charges on the life insurance policy, effectively bypassing regulatory oversight of LTC rates; 3) LTC benefits attached to life or annuity policies typically do not offer inflation protection; 4) attaching LTC benefits to a non-permanent form of life insurance (including universal life [UL]) may lead to underfunding and lapse of the policy when most needed; and 5) attaching LTC benefits to life insurance with flexible premiums deprives policyholders of vital protection against unintentional lapse.

Mr. Serbinowski said given the change in the marketplace, LTCI connection to life insurance may warrant a look. He said he would be willing to provide more concrete examples at the next meeting. Ms. Burns said agents debate among themselves, and they are at times confused as to whether something is LTCI or not. Mr. Gennace reminded the Subgroup that it is not rewriting anything now; but he said it was a good discussion, and it may be worth looking into the definitions of LTCI.

Mr. Gennace asked if anyone wished to discuss the consumer representatives’ comments on Section 5 of Model #640. Birny Birnbaum (Center for Economic Justice—CEJ) said the section could use clarification. He said he was asked by a policyholder about a group policy issued to an organization in Washington, DC on a form approved by the Washington, DC Department of Insurance, Securities and Banking (DISB) and with initial rates approved by the DISB. He said the insured is a Washington resident who encountered a rate increase approved by the DISB. He said Section 5 seems to cover whether the group policy approved in one state can be offered to organization members living in another state, but it does not address rate increases. He asked whether there can be differential rate increases across states if the group policy initially had the same rates regardless of insured location. He also asked why the Washington, DC DISB would not be responsible for all other rate changes if the DISB initially approved the group policy rates.

Mr. Gennace asked if anyone wished to discuss the consumer representatives’ comments on Section 6 of Model #640. Mr. Birnbaum, Ms. Burns and Ms. Cude said Section 5 should be divided into two different sections, and significant thought must be given to what and how disclosures are made. Ms. Cude said there must be a more robust disclosure section. Ms. Burns said unintentional lapses and the waiver of premiums should be addressed and mentioned. Mr. Birnbaum said Model #641 has a lot of disclosure, and Model #642 and Model #643 cannot be viewed in isolation but in conjunction, as Model #642 must be read with Model #643.

Mr. Gennace asked if anyone wished to discuss the consumer representatives’ comments on Section 6J of Model #640. He said it seems this has already been discussed, and he asked if there were any further comments. He asked if anyone wished to discuss the consumer representatives’ comments on Section 6L of Model #640 that a policyholder should not have to wait 60 days for an explanation to contest an unreasonable benefit denial. Ms. Burns said it is self-explanatory.

Mr. Gennace said the next meeting of the Subgroup would be held on May 27, and he asked for comments to Sections 7 through 14 of Model #640 to be submitted by close of business on May 21.

Having no further business, the Long-Term Care Insurance Model Update (B) Subgroup adjourned.
The Long-Term Care Insurance Model Update (B) Subgroup met April 22, 2021. The following Subgroup members participated: Philip Gennace, Chair (NJ); Laura Arp, Vice Chair (NE); Sarah Bailey (AK); Tyler McKinney (CA); Maureen Belanger (NH); Jill Kruger (SD); Elsie Andy (VA); and Michael Bryant (WA). Also participating were: Steve Dozier (AL); Erin Klug (AZ); Paul Lombardo (CT); Susan Jennette (DE); Andria Seip (IA); Kathy McGill (IL); Karl Knable (IN); Eric Anderson (KS); Ron Kreiter (KY); Adam Zimmerman (MD); Sherry Ingalls (ME); Renee Campbell (MI); Fred Andersen (MN); Carrie Couch (MO); Bob Williams (MS); Martin Wojcik (NY); Stephen Flick (OH); Mike Rhoads (OK); Jim Laverty (PA); Sarah Neil (RI); Andrew Dvorine (SC); Vickie Trice (TN); Rachel Bowden (TX); Mary S. Block (VT); Julie Walsh (WI); Grego Elam (WV); and Tana Howard (WY).

1. Discussed the Work of the Subgroup

Mr. Gennace explained the process, procedure and format for the Subgroup moving forward. He said one of the charges of the Senior Issues (B) Task Force is to review the existing long-term care insurance (LTCI) models to determine their flexibility to remain compatible with the evolving delivery of long-term care (LTC) services and remain compatible with the evolving LTCI marketplace. He said the Subgroup was established to determine whether the Long-Term Care Insurance Model Act (#640) and the Long-Term Care Insurance Model Regulation (#641) need to be updated to remain flexible and compatible with the LTCI marketplace. He said if the Subgroup determines an update is needed, it will report to the Senior Issues (B) Task Force, and the Subgroup would begin work. He said if the Subgroup determines an update is not needed, the Subgroup will report to the Senior Issues (B) Task Force and will await any recommendations from the Long-Term Care Insurance (EX) Task Force.

Mr. Gennace said Model #640 and Model #641 have not been fully reviewed since 2009/2010. He said the most recent updates to the models were done in 2016, specifically to Section 6 of Model #640 and to Appendix B and Appendix F of Model #641. He said it is important the Subgroup focuses on the purpose of its work and not get sidelines by comments, requests and/or recommendations to edit the model. He said the Subgroup is not editing Model #640 or Model #641 but rather will determine if Model #640 or Model #641 retains the flexibility to remain compatible with LTC services and the LTCI marketplace or if it needs an update to language, terms or definitions.

Mr. Gennace said the Subgroup would first review Sections 1–7 of Model #640. He said comments should be submitted to David Torian (NAIC) by close of business on April 30. He said Mr. Torian will redline the comments, share with the Subgroup, and those comments will be discussed during the Subgroup’s next meeting scheduled for 1:00 p.m. ET on May 6. He asked if there were any questions or comments.

Birny Birnbaum (Center for Economic Justice—CEJ) said he thinks the timeline is too short for a full review and will result in an ineffective review. He said there are sections that are referenced in different parts of the model that may not be in the sections the Subgroup would be reviewing at that time. Mr. Gennace said if there is a cross reference, it can be noted in the comments to be submitted. Mr. Birnbaum said he still thinks the format does not allow for sufficient time for parties to review, edit and comment. Ms. Kruger said there is nothing preventing the Subgroup from going back to a previous section if necessary. Ms. Andy said this beginning process is not edit and update but rather to determine whether to edit and update. Karrol Kitt (University of Texas at Austin) said her experience with other model updates was to go section by section or smaller grouped sections. Mr. Gennace said the Subgroup should see how this works and move ahead with the planned format, and if the timing does not seem to work, the Subgroup will make the necessary adjustments.

Having no further business, the Long-Term Care Insurance Model Update (B) Subgroup adjourned.
PROPERTY AND CASUALTY INSURANCE (C) COMMITTEE

Property and Casualty Insurance (C) Committee Aug. 16, 2021, Minutes................................................................. 8-2

The Property and Casualty Insurance (C) Committee met in Columbus, OH, Aug. 16, 2021. The following Committee members participated: Vicki Schmidt, Chair (KS); Mike Chaney, Vice Chair (MS); Jim L. Ridling (AL); Ricardo Lara represented by Ken Allen (CA); Andrew N.Mais (CT); Colin M. Hayashida represented by Martha Im (HI); Amy L. Beard (IN); James J. Donelon (LA); Kathleen A. Birrane (MD); Grace Arnold represented by Phil Vigliaturo (MN); Larry D. Deiter (SD); Tregenza A. Roach (VI); Michael S. Pieciak (VT); Mike Kreidler represented by Molly Nollette (WA); and James A. Dodrill (WV). Also participating were: Lori K. Wing-Heier (AK); Michelle Brugh Rafeld (OH); and Don Beatty (VA).

1. **Adopted its Spring National Meeting Minutes**

Director Deiter made a motion, seconded by Commissioner Chaney, to adopt the Committee’s April 13 minutes (see NAIC Proceedings – Spring 2021, Property and Casualty Insurance (C) Committee). The motion passed unanimously.

2. **Adopted the Reports of its Task Forces and Working Groups**

   a. **Casualty Actuarial and Statistical (C) Task Force**

   Mr. Vigliaturo reported that the Casualty Actuarial and Statistical (C) Task Force has been assisting the Blanks (E) Working Group in evaluating two proposals for expansion of information to be included on the Property and Casualty Annual and Quarterly Statements: 1) proposal 2021-11BWG, which adds data reporting on policy writings for private passenger and homeowners insurance; and 2) proposal 2021-13BWG, which expands reporting for general liability insurance to include subline detail. The Task Force responded to the initial requests from the Working Group by offering future assistance on the first proposal and supporting the second proposal. After the Working Group met at the end of July, it sent the Task Force a modified personal lines proposal and asked for feedback while simultaneously asking financial groups whether the proposed data assists financial solvency regulation in line with the purpose of the annual statement. Mr. Vigliaturo said the Statistical Data (C) Working Group will be exploring the possibility of getting the data from statistical agents earlier each year.

   Mr. Vigliaturo said the Task Force is also in the process of responding to a second exposure draft for U.S. qualification standards from the American Academy of Actuaries (Academy). He also reported that the predictive model training called the “Book Club” and the monthly regulator-only discussion about rate filing issues continue, and both offer valuable information for actuaries and non-actuaries. He said both are valuable projects for the NAIC when it comes to educating state insurance regulators on predictive models and sharing expertise on rate issues.

   b. **Surplus Lines (C) Task Force**

   Commissioner Donelon said the Surplus Lines (C) Task Force met Aug. 16 and adopted the 2022 proposed charges of the Task Force and the Surplus Lines (C) Working Group. He said the Surplus Lines (C) Working Group met in June in regulator-to-regulator session, pursuant to paragraph 3 (specific companies, entities or individuals) of the NAIC Policy Statement on Open Meetings, to discuss two applications seeking admission to the July 1 Quarterly Listing of Alien Insurers. Commissioner Donelon also reported that the Task Force has formed a drafting group to amend the Nonadmitted Insurance Model Act (#870).

   c. **Title Insurance (C) Task Force**

   Ms. Rafeld said the Title Insurance (C) Task Force met May 11 and heard an update on revisions to the Title Insurance Consumer Shopping Tool Template. She said AM Best presented on current trends in the title insurance sector as detailed in its recent “Market Segment Outlook: U.S. Title Insurance.” In February, AM Best revised its U.S. title industry outlook from negative to stable due to exceptional performance in 2020. The title industry overall was the most profitable segment in the property/casualty (P/C) industry. The use of innovative technology and a surge in home refinances and purchases in the latter half of 2020 supported the industry. She also reported Birny Birnbaum (Center for Economic Justice—CEJ) presented on how state insurance regulators could use after-tax return on capital to determine what a reasonable profit is for a title insurer.

   Ms. Rafeld said the Task Force also met July 13 and took the following action: 1) adopted revisions to the Title Insurance Consumer Shopping Tool Template; 2) heard a presentation from the Federal Bureau of Investigation (FBI) on business email
compromise schemes and other cybercrimes; and 3) heard from state insurance regulators about title insurance fraud trends in their respective states. Trends included fraudulent settlement transactions, wire fraud complaints, cybercrime, and defalcations.

d. Workers’ Compensation (C) Task Force

Director Wing-Heier said the Workers’ Compensation (C) Task Force met July 21 and heard a presentation about the classification of telecommuters and the potential implications of an increase in telecommuting on workers’ compensation. She said the National Council on Compensation Insurance (NCCI) reported that in May 2020, about 35% of the employed work force reported they had worked from home due to COVID-19. A McKinsey Global Institute study estimated that about 29% of the work done in the U.S. could be done remotely with no loss in productivity. The NCCI sees no indication that there will be any significantly large impacts to workers’ compensation even if remote work does catch on as expected.

Director Wing-Heier noted the Task Force continues to monitor COVID-19 as claims information becomes available. To date, there has not been a significant impact on workers’ compensation insurance. Workers’ compensation rates continue to fall in 2021, and the market is still stable.

e. Cannabis Insurance (C) Working Group

Mr. Allen said the Cannabis Insurance (C) Working Group met April 27 and held a panel discussion on cannabis insurance-related legislation, including: 1) the Secure and Fair Enforcement (SAFE) Banking Act of 2021, which would create a safe harbor for banks providing services to cannabis-related businesses in legal states; and 2) the Clarifying Law Around Insurance of Marijuana (CLAIM) Act, which would create a safe harbor for insurers engaging in business with cannabis-related businesses.

Mr. Allen said the Working Group also met May 27 and discussed a draft memorandum to the Government Relations (EX) Leadership Council recommending that the Leadership Council consider supporting the SAFE Banking Act and CLAIM Act. These bills would help remove federal barriers for insurers to conduct business with any state legalized cannabis-related businesses, thereby helping to provide insurance coverage options for these commercial policyholders that will mitigate their business risks.

Mr. Allen said the Working Group held a two-day hearing on July 19 and July 27. The first day of the hearing provided a foundation of understanding and a look at insurance product availability in the cannabis-related insurance market. It included presentations on the impact of the geographical expansion of legalized cannabis states; the cannabis regulatory and licensing landscape; the unique insurance needs of the cannabis market; commercial cannabis product options; and admitted and nonadmitted coverage availability across the cannabis business sectors. The second day of the hearing focused on structural obstacles inhibiting insurers from offering coverage; insurance gaps and how insurance regulators can support growth of the admitted market, including presentations on balancing actual and perceived risks in the cannabis space; obstacles to insurers offering coverage in the cannabis-related business space; insurance coverage challenges for cannabis-related businesses; and emerging trends and how insurance regulators can support growth of the cannabis insurance market.

Mr. Allen said the Working Group plans to use the information gained over this two-day hearing to update its white paper, Understanding the Market for Cannabis Insurance, through the addition of an appendix. Drafting sessions on the white paper appendix will begin in August. The Working Group also plans to leverage the feedback gained from the hearing to discuss during its next meeting how state insurance regulators can better collaborate with each other and other regulatory agencies.

f. Catastrophe Insurance (C) Working Group

Commissioner Chaney said the Catastrophe Insurance (C) Working Group received a referral from the Climate and Resiliency (EX) Task Force asking it to update the Catastrophe Computer Modeling Handbook (Handbook) by: 1) determining how state insurance regulators are currently using the Handbook; 2) coordinating with the Catastrophe Risk (E) Subgroup to understand the materials it is developing regarding catastrophe models; 3) updating questions in Section VII of the Handbook to include wildfire; 4) considering the addition of questions specific to additional perils used in catastrophe models including flood; and 5) exploring which catastrophe modelers have begun including climate data in their models. He said the Working Group formed a drafting group to work on these referral items. Commissioner Chaney said the Working Group recently heard from Mississippi regarding the Mississippi Windstorm Underwriting Association (MWUA) FORTIFIED Roof upgrade program that was implemented in Mississippi and began discussions regarding the American Property Casualty Insurance Association’s (APCIA’s) Catastrophe Actions Toolkit.

Commissioner Chaney also noted that the newly formed NAIC/Federal Emergency Management Agency (FEMA) (C) Advisory Group held its first meeting to discuss its charges related to prioritizing and recording interactions with the NAIC’s
FEMA colleagues (Attachment One). The group heard a summary of recent engagements with FEMA and will be putting materials on the NAIC’s Catastrophe Resource Center.

g. **Pet Insurance (C) Working Group**

Mr. Beatty said the Pet Insurance (C) Working Group adopted the Pet Insurance Model Act during its Aug. 4 meeting, but subsequently state insurance regulators and NAIC legal staff found there were some unclear issues that remained in the model. Mr. Beatty said he believes a few of these are not substantive, but a couple should be discussed. He said he would recommend the Committee vote to keep the model open so that the Working Group could meet to receive input from all parties before adopting the model.

Director Deiter made a motion, seconded by Commissioner Birrane, to adopt an extension to the Fall National Meeting for revisions to the proposed Pet Insurance Model Act. The motion passed unanimously. Commissioner Schmidt said the Property and Casualty Insurance (C) Committee will likely meet in the near future so that it can consider the model and perhaps refer it to the full NAIC membership at the Fall National Meeting.

h. **Terrorism Insurance Implementation (C) Working Group**

Commissioner Schmidt said the Terrorism Insurance Implementation (C) Working Group has not met since the Spring National Meeting, but state insurance regulators decided to pause the State Supplement portion of the state regulator terrorism risk insurance data call for fall. The Working Group plans to meet soon to discuss workers’ compensation and other data received in the data call earlier this year.

i. **Transparency and Readability of Consumer Information (C) Working Group**

Ms. Hatchette said the Transparency and Readability of Consumer Information (C) Working Group has been working on several items for a best practices document on disclosures for premium increases. The Working Group formed three drafting groups to work on three different documents: 1) the Thresholds and Communications Standards Drafting Group; 2) the Rate Checklist Drafting Group; and 3) the Consumer Education Drafting Group.

Ms. Hatchette said the Thresholds and Communications Standards Drafting Group discussed and determined several requirements for disclosures to be sent to consumers regarding premium increases. At this time, this document will be a part of the best practices document and is not required, as states will have to make these requests of insurers if they want to use the disclosures. The Drafting Group determined the following items would be necessary for a disclosure: 1) a 10% threshold (any rate change >= 10% on renewal) will trigger a notice; 2) the notice must be sent at least 30 days prior to renewal; 3) the notice must include the new premium vs. the old premium; 4) items affecting the premium increase should be listed by dollar amount; 5) the top reasons for premium increase should be listed; 6) these reasons should account for 80% of the premium increase; and 7) the top five reasons for the premium increase should be listed.

Ms. Hatchette said the Rate Checklist Drafting Group found that many states do not have a rate checklist in place. Kansas and Connecticut both have them in place and have found them to be extremely helpful. The use of a checklist is not required but will be included in the best practices document. This document is to be filled out by the insurer during the rate filing process. The Drafting Group is using the rate checklist developed by Kansas in addition to adding two questions about rate modeling, as there are times where insurers do not mention this, and asking the questions will bring awareness to the insurer.

Ms. Hatchette said the Consumer Education Drafting Group has formed three smaller drafting groups to draft specific topics, such as underwriting and rating, factors affecting premium increase, and discounts for auto insurance. The goals of the consumer education document are to: 1) provide consumers with a basic understanding of rate making so they can better understand a disclosure, especially if the consumer receives a premium increase; 2) inform consumers of things they can do to mitigate premium increases; 3) provide information that can be readily available in various forms for inquiries to departments of insurance (DOIs) from other entities such as legislators and media; and 4) reduce the number of consumer calls to the DOIs regarding understanding of why their rates increased. Once this work is complete and a document is in place, the NAIC Communications department has agreed to put together infographics, social media pieces, consumer alerts, etc. that will be available to the DOIs to use. The Working Group will also work with the NAIC Communications department to see what types of consumer testing would be available to determine the effectiveness of the disclosure document.

Commissioner Mais made a motion, seconded by Commissioner Donelon, to adopt the following task force and working group reports: Casualty Actuarial and Statistical (C) Task Force; Surplus Lines (C) Task Force; Title Insurance (C) Task Force; Workers’ Compensation (C) Task Force; Cannabis Insurance (C) Working Group (Attachment Two); Catastrophe Insurance (C) Working Group (Attachment Three); Pet Insurance (C) Working Group (Attachment Four); Terrorism Insurance
Implementation (C) Working Group; and Transparency and Readability of Consumer Information (C) Working Group (Attachment Five). The motion passed unanimously.

3. **Adopted Revisions to the Title Insurance Consumer Shopping Tool Template**

Ms. Rafeld said the Title Insurance (C) Task Force formed a drafting group to include questions and answers about title insurance-related fraud topics within the Title Insurance Consumer Shopping Tool Template. The drafting group included information about wire fraud schemes and steps consumers can take to avoid fraud. The drafting group consulted with consumer groups to assist with the language. The drafting group also made changes to modernize the language. The Task Force adopted the revisions on July 13. Commissioner Dodrill pointed out the table of contents would need to be revised.

Commissioner Dodrill made a motion, seconded by Commissioner Chaney, to adopt the revisions to the Title Insurance Consumer Shopping Tool Template (Attachment Six). The motion passed unanimously.

4. **Heard Presentations on How to Close the Insurance Protection Gap**

John Huff (Association of Bermuda Insurers and Reinsurers—ABIR) said the Bermuda market responded in the 1990s to Florida hurricanes with a strong reinsurance market. The Bermuda market works to balance noncorrelated risks such as Kansas tornado risks with European flood risks. The Bermuda market provides more than 50% of the capacity for U.S. mortgage reinsurance, helping to facilitate home ownership for Americans. Bermuda reinsurers make up 36% of the global P/C reinsurance market. In the Texas 2021 winter storm, the Bermuda reinsurance market covered 20% of that loss, resulting in $2.7 billion. Mr. Huff noted that capital capacity is what is needed to close the protection gap.

Mr. Huff said the Centre for Risk Studies at Cambridge Judge Business School recently released a report titled *Optimizing Disaster Recovery: The Role of Insurance Capital Improving Economic Resilience*. This report noted that the annual average loss from natural disasters worldwide jumped from $27 billion in the 1970s to nearly $200 billion in the 2010s. The report analyzed more than 100 natural catastrophe case studies from around the world and found that countries with higher insurance penetration were able to recover far more quickly than communities with lower insurance penetration. Mr. Huff noted that the report found for each percentage point increase in insurance penetration, a country’s economic recovery time was reduced by almost 12 months.

Mr. Huff also said the recent California report *Protecting Communities, Preserving Nature and Building Resiliency: How First-of-its Kind Climate Insurance Will Help Combat the Costs of Wildfires, Extreme Heat, and Floods* provides guidance on how states can handle the protection gap.

Mr. Huff noted there are advantages of leveraging the international reinsurance capacity, including ensuring consumer coverage remains affordable and accessible, diversifying risk pools, exporting risks away from a jurisdiction, providing private market solutions, protecting communities and taxpayers, and helping to close the protection gap.

Mr. Huff said the ABIR is involved with the Insurance Development Forum (IDF), which is a public-private partnership with the World Bank and United Nations (UN). Ekhosuehi Iyahen (IDF) said the IDF’s objective is to extend insurance and risk management capabilities to build resilience and protection for individuals and communities. She noted the IDF has five working groups focused on: 1) risk modeling; 2) improving the quality of risk information; 3) sovereign and humanitarian efforts; 4) inclusive insurance; and 5) investments. She said governments sit on the steering committee for the IDF.

Ms. Iyahen noted the size of the global insurance protection gaps is $162 billion. The percentage of natural disaster losses in developing countries that were insured is around 1%. She said economic shocks are absorbed by individuals and governments, and funds are diverted away from health and education. Ms. Iyahen said developed countries also have a protection gap, and it is often those most in need of protection that are unprotected. She said communities often are not properly prepared for disasters. She noted that international organizations are taking this problem seriously in how to proactively address the protection gap. She said there is need for greater investment in risk awareness and understanding, risk reduction, and disaster response activities. She also noted there is a growing appreciation among international bodies of the role of finance and insurance.

Ms. Iyahen said innovative services and products to help governments understand natural hazard risks can be used to design systems to protect citizens and infrastructure. She noted there has been an increase in parametric products used by governments. She said regulators can support the broader conversation of how to build effective risk management and protection systems for the future by engaging with the insurance industry. She said regulators can help to drive the conversation by keeping pace of
innovation and new products and fostering collaboration and coalitions with knowledge sharing. Ms. Iyahen also said the IDF has issued a number of reports that explore these critical issues.

Commissioner Schmidt asked about the open-source modeling workstream at the IDF. Ms. Iyahen said the modeling work is critical because it creates a foundation for the understanding of risk. She said there is a need for communities to have more information to support decision-making. She said the IDF works with governments and vulnerable communities in better understanding risk through modeling.

Commissioner Schmidt asked about the growing protection gap in the U.S. as it relates to flood and earthquake risks being optional endorsements to coverage. Mr. Huff said flood is the top peril in all states. He said there is a reputational risk for the insurance industry due to some risks being optional endorsements and consumers being uninsured due to a lack of education about those risks. He said regulators need to have honest dialogue with the insurance industry and perhaps consider an all-perils approach to insuring risk. Mr. Huff noted that earthquake is an issue throughout the U.S. as well and that the Missouri Department of Commerce and Insurance is planning an earthquake summit in St. Louis, MO, to be held in September. He said the industry must do better job of making sure these risks are covered. He stressed that protection gaps exist even in the U.S., which is the most developed insurance market in the world.

Lieutenant Governor Roach asked whether there has been conversation about the cost and availability of insurance products leading to the protection gap. Ms. Iyahen said for developing communities, only 1% to 3% of the population is insured. She said where insurance is not part of the conversation, the IDF is working with partnerships to discuss the cost coverage, new products like parametric products, and how risks can be measured. She said it is critical that jurisdictions share knowledge with each other.

5. **Heard a Report on the Cybersecurity Insurance Market**

Aaron Brandenburg (NAIC) provided an overview of the data received in the Cybersecurity and Identity Theft Insurance Coverage Supplement. He said the data does not include the alien surplus line data because that data comes into the NAIC’s International Insurance Department in a separate filing. He noted that the alien surplus lines data would be included in a later report, likely to be released during a cyberinsurance session at the September Insurance Summit.

Mr. Brandenburg reported $2.74 billion was reported in combined direct written premium in stand-alone and package policies for 2020, which is a 22% increase over 2019. This follows increases of 11% and 7% the two years before that. He also noted there were more than 4 million cyber policies in force in 2020, an increase of 21% over the prior year. About 35%–37% of claims have been closed with payment over the past three years.

Mr. Brandenburg reported the largest writers in 2020 were Chubb, AXA, and AIG. Loss ratios varied across companies. The top five insurers made up more than 50% of the market, and the top 20 insurers wrote 84% of total premium. He said 2020 saw particularly high losses compared to prior years, rising from 65% in aggregate from below 50% in prior years.

Mr. Brandenburg noted that there has been a great increase in ransomware attacks across the last year. He said insurers have taken action to address changes to the market, including in the most extreme cases some insurers pulling out of the cyber market. Insurers have responded to large ransomware events by adding coinsurance and sublimits on their cyber policies, especially for businesses that do not have the best cyber hygiene. Other insurers have refreshed policy language to address the scope of coverage, exclusions, and sub-limits, as well as to identify areas where there is greater exposure.

Mr. Brandenburg said an Aon report called on the NAIC to create separate statutory categories for cyberinsurance to better illustrate how the industry is handling cyber risk as both premiums and claims continue to grow. The report suggests adding a separate line of business including on Schedule P, splitting cyber liability third-party commercial, cyber damage for first-party commercial, and cyber for personal lines. He noted other reports such as: 1) the Verizon *Data Breach Investigations Report*, which provides information on data breaches and incident classification patterns by industry; 2) an AM Best report that provides an analysis of the data contained within the Annual Statement Supplement; 3) the *Betterley Report*, which includes insights from 20 insurers and covers exclusions found in policies and the increasing costs of cyberinsurance; 4) a Gallagher report that provides information about the hardening cyberinsurance market and market capacity; 5) a U.S. Government Accountability Office (GAO) report that summarizes take-up rates coverage limits; and 5) the *Coalition Cyber Insurance Claims Report*, which covers different types of incidents that make up cyberinsurance claims.
Director Farmer asked if there is a risk to the cyberinsurance market, similar to what happened in the long-term care (LTC) market where insurers underpriced the risk. Mr. Brandenburg said NAIC financial staff have been working with regulators in looking at solvency issues.

Mr. Brandenburg said the Private Flood Insurance Supplement was new in 2021. Previously, through 2019, commercial and residential private flood data were combined on line 2.5 of the state page. State insurance regulators embarked on a data call in 2020 to collect 2018 and 2019 data and break commercial from residential. The data call also broke out stand-alone from endorsement and first dollar from excess. It included new data elements such as number of policies, claims opened, and claims closed. Mr. Brandenburg said the new Private Flood Insurance Supplement mirrors what was collected through the data call.

Mr. Brandenburg said there may be data errors within the Supplement as some states have identified insurers that should have but did not file the Supplement. He reported that the number of private commercial flood policies grew in 2020, but the number of residential policies fell. He said premiums rose greatly in commercial policies but fell slightly in residential. The total amount of direct written premium was $700 million in 2020.

Mr. Brandenburg said the NAIC and state insurance regulators have been working closely with FEMA in recent years in building the flood insurance market—whether that is the National Flood Insurance Program (NFIP) or the private market—in order to make sure individuals are better protected from flood risks. He said the number of companies writing residential private flood insurance grew over the last few years, from 55 in 2018 to 58 in 2019 to 81 in 2020. Premium fell slightly in 2020; 82% of the premium was in stand-alone rather than endorsements. He noted that residential private flood losses rose from $28 million in 2019 to $50 million in 2020. The residential private flood average premium fell in stand-alone products but rose in endorsements. He noted that loss ratios were highest in Alabama, Massachusetts, Michigan, Tennessee, and Utah for residential private flood in 2020.

Mr. Brandenburg said 15 insurance groups wrote at least $1 million in residential premium in 2020, with the top 15 insurers totaling $160 million in premium, which was over 85% of the market. Stand-alone first dollar policies had the most premium, with stand-alone excess next. Mr. Brandenburg said the results would be put on the NAIC website once additional data is received from insurers.

Mr. Birnbaum asked whether lender-placed flood insurance had been analyzed by the NAIC yet, and Mr. Brandenburg responded that it had not.

7. **Discussed the Special (EX) Committee on Race and Insurance**

Commissioner Schmidt said the Special (EX) Committee on Race and Insurance has adopted new charges and that the (P/C) issues will remain with Workstream Three of the Special Committee. She noted that the Special Committee met Aug. 15, where several interesting presentations will be leveraged by Workstream Three as it begins to create a work plan.

8. **Discussed Future Conference Call**

Commissioner Schmidt noted that Robert Hunter (Consumer Federation of America—CFA) reached out recently with a request to speak to the Committee about auto insurer premium refunds related to reduced driving throughout the COVID-19 pandemic. Due to the late nature of the request and the Committee having a full agenda, Commissioner Schmidt said the Committee may wish to take up the issues during a future meeting. She noted that regulatory actuaries have had many discussions regarding rate filings with COVID-19 adjustments. Mr. Birnbaum reiterated the desire to have a discussion about auto insurance refunds, and he also noted that he spoke before the NAIC/Consumer Liaison Committee on the impact the COVID-19 pandemic had on credit scores and before the Special (EX) Committee on Race and Insurance about how to test for bias in insurance models.

Having no further business, the Property and Casualty Insurance (C) Committee adjourned.

NAIC/Federal Emergency Management Agency (FEMA) (C) Advisory Group
Virtual Meeting
August 3, 2021

The NAIC/FEMA (C) Advisory Group of the Property and Casualty Insurance (C) Committee met Aug. 3, 2021. The following Working Group members participated: James A. Dodrill, Chair (WV); Glen Mulready, Vice Chair (OK); Katie Hegland (AK); Brian Powell (AL); Lucy Jabourian and Deborah Halberstadt (CA); George Bradner (CT); Virginia Christy (FL); Travis Grassel (IA); Patti Dorn (MD); Jo LeDuc (MO); David Dahl (OR); Beth Vollucci (RI); MaryAnn Carney (VA); and Matt Stoutenburg (WA).

1. Welcomed Members

Commissioner Dodrill welcomed members and thanked Commissioner Mike Chaney (MS), the chair of the Advisory Group’s parent group, the Catastrophe Insurance (C) Working Group. He announced that Commissioner Mulready would be serving as vice chair of the Advisory Group. He also noted that 18 states had signed up to be members. He noted that in future meetings, representatives of FEMA would be asked to speak to state insurance regulators about how to better engage with them.

2. Reviewed its Charge

Commissioner Dodrill said the Advisory Group’s charge reads:

The NAIC/FEMA Advisory Group will assist state regulators in engaging and collaborating with FEMA on an ongoing basis by establishing a process for the oversight, prioritization and reporting of disaster-related regional workshops and other exercises to improve disaster preparation and resilience.

Commissioner Dodrill noted the charge indicates the Advisory Group will need to create a process for oversight and prioritization and a reporting mechanism. He said before deciding on how to oversee and create priorities, the Advisory Group probably needs to understand recent activities that state insurance regulators and FEMA have been engaged in. Commissioner Dodrill said this may lead state insurance regulators to want to participate in similar or new activities. He said the Advisory Group will need to receive feedback from members in order to help oversee and prioritize those projects.

Commissioner Dodrill said the reporting mechanism will be key in order to keep track of not just historical activities, but also upcoming ones. He said the Catastrophe Insurance (C) Working Group has created a Catastrophe Resource Center web page, where it has housed catastrophe resources like bulletins, NAIC disaster capabilities, and some workshops that have already been held with FEMA. He said the Advisory Group should build off that and use it to keep track of historical and future activities.

Ms. Jabourian asked if the Advisory Group would discuss what entails oversight of state insurance regulator activities. Commissioner Dodrill said the Advisory Group would have that discussion early in the process but would receive reports on activities first.

Ken Klein (California Western School of Law) asked if the Advisory Group might consider working with FEMA to see if statewide loss and exposure data could be obtained so that state insurance regulators could determine how much property is insured and what a total loss would look like in a geographic area. Commissioner Dodrill said state insurance regulators have shared data with FEMA in the past and will continue to examine future data capabilities.

3. Heard an Overview of Recent Activities between State Insurance Regulators and FEMA

Aaron Brandenburg (NAIC) said he would provide an overview of activities state insurance regulators have recently held with FEMA, but he said in the future, the Advisory Group might want to hear directly from FEMA staff. He said NAIC staff have begun to put many of these FEMA-related resources on the NAIC’s Catastrophe Resource Center web page.

Mr. Brandenburg noted that state insurance regulators have held meetings dealing with flood and other disasters with FEMA Region IV and Region VII last year and a combined meeting with FEMA Region VIII, Region IX and Region X in 2021. Recordings and materials for these sessions are included in the Catastrophe Resource Center. He said for Region IV, an
agreement has been signed between the states and FEMA to form a working group so that the parties can continue to engage, typically on a monthly basis through conference calls. That working group has met several times already this year to share consumer resources and data, to talk about practical and logistical issues arising during disasters, and to hear about technologies that can assist them while in the midst of a disaster. He noted that other regions might wish to set up similar working groups and that the Advisory Group might be one way to manage and provide assistance to those groups. The NAIC is also looking at how to create a regulator-only portal within the Catastrophe Resource Center to house that information.

Mr. Brandenburg said the pre-mitigation workstream of the Climate and Resiliency (EX) Task Force held a mitigation workshop in March 2021. The Center for Insurance Policy and Research (CIPR) worked with the Federal Alliance for Safe Homes (FLASH) and FEMA in putting on this workshop, which focused on building codes, mitigation, and resiliency funding. FEMA provided an overview of its building codes strategy. States heard about FEMA’s Hazard Mitigation Assistance (HMA) grant program and Building Resilient Infrastructure and Communities (BRIC) program. The NAIC recently hosted a workshop for states and a contractor on assisting states in applying for BRIC grants.

Mr. Brandenburg said several Insurance Summit sessions were held in June that built off the mitigation workshop. FEMA personnel made several presentations that are relevant to state insurance regulators, including a presentation about the National Flood Insurance Program’s (NFIP’s) Community Rating Service (CRS). CRS is a voluntary program for NFIP communities. It is a rating program where the CRS rating results in a direct insurance premium discount. Mr. Brandenburg noted that an addendum to the CRS Coordinator M was updated in 2021 and included a new credit given to communities if they hold a flood insurance meeting such as a town hall and provide brochures or other information. There is an additional credit for participation if the state insurer commissioner’s office is involved as a rep to talk or be available to answer insurance questions. He noted that most departments of insurance (DOIs) already hold such consumer events, so it may be an easy way for communities to receive additional credits. Mr. Brandenburg said FEMA also spoke at the Insurance Summit about the importance of partnerships related to mitigation efforts. CRS is evolving and creating new information and priorities through 2025. FEMA is gathering data over the next year and is seeking feedback from state insurance regulators. A presentation was held during the Insurance Summit on building codes, including results from the FEMA study on building codes showing total losses avoided and the annual amount of money saved annually based on hazard-resistant building codes. There was an Insurance Summit session on earthquake mitigation that covered: state grants for mitigation and preparedness; the Wasatch Front Unreinforced Masonry Risk Reduction Strategy; and a program in Salt Lake City, UT, known as “Fix the Bricks” that seeks to repair the worst buildings. Finally, Mr. Brandenburg said FEMA covered its National Risk Index, which shows expected annual losses, social vulnerability, and community resilience to create a risk index that represents the potential for negative impacts resulting from natural hazards.

Mr. Brandenburg said the state of Washington is planning a Cascadia Rising 2022 exercise with FEMA partners and has been planning the event with neighboring states, the NAIC, and FEMA. FEMA also released a report in July 2021 titled Building Private-Public Partnerships, which helps public and private sector emergency managers collaborate to increase resilience.

Mr. Brandenburg said the NAIC will put as many of these documents and engagements as it can on the Catastrophe Resource Page and will work with the Advisory Group on how to organize the materials.

Jeff Czajkowski (CIPR) also noted that the NAIC has an agreement with FEMA used for Region IV that could be used for other states. He said state insurance regulators have participated in training provided by FEMA on the NFIP’s Risk Rating 2.0. He also noted the Missouri Department of Commerce and Insurance will host an earthquake summit will be held in September in St. Louis, MO. Mr. Bradner asked if the FEMA sessions on Risk Rating 2.0 are available, and Mr. Czajkowski said he would check and have links sent to state insurance regulators.

4. Discussed its Next Meeting

Commissioner Dodrill said FEMA staff may be asked to speak to state insurance regulators during the next Advisory Group’s next meeting. He said the Advisory Group would also look at recent updates to the Catastrophe Resource Center in order to help with the reporting mechanism for historical and future events.

Having no further business, the NAIC/FEMA (C) Advisory Group adjourned.
Draft: 8/20/21

Cannabis Insurance (C) Working Group
Virtual Meeting (in lieu of meeting at the 2021 Summer National Meeting)
July 27, 2021

The Cannabis Insurance (C) Working Group of the Property and Casualty Insurance (C) Committee met July 27, 2021. The following Working Group members participated: Ricardo Lara, Chair, represented by Melerie Michael (CA); Michael Conway, Vice Chair, represented by Peg Brown (CO); Jimmy Harris (AR); Angela King (DC); Tanisha Merced (DE); C.J. Metcalf (IL); Marlene Caride represented by Randall Currier (NJ); Gennady Stolyarov and Mark Garratt (NV); Shelly Scott (OK); Raven Collins (OR); Christina Rouleau (VT); and Michael Walker and Ned Gaines (WA). Also participating was: George Bradner (CT); and Benjamin Yardley (ME).

1. Heard a Presentation on Balancing Actual and Perceived Risks

Ms. Brown stated that the second day of the Fact-Finding Hearing on Insurance for Cannabis-Related Businesses will focus on barriers to affordability and moving forward. As much has transpired in this industry over last decade, the Working Group intends to use the information gained from the two-day hearing to update its white paper, Understanding the Market for Cannabis Insurance, through the addition of an appendix. Drafting sessions on the white paper appendix will begin in August. Working Group members interested in participating in these drafting sessions were directed to notify NAIC staff by Aug. 10.

The Working Group also plans to leverage the feedback gained from the hearing to discuss at its next meeting how state insurance regulators can better collaborate with each other and other regulatory agencies.

Brenda Wells (East Carolina University) stated that cannabis businesses pay several times what other industries pay for insurance. Directors and officers liability insurance costs well into the six-figure range for $1 million in coverage. A small mercantile general liability policy might cost around $1,000, but a cannabis policy without products liability is about $10,000. Consumer concerns and misperceptions include a belief that coverage is not available or not worth the cost. Additionally, there is a fear that information provided to the insurer can be accessed by the federal government or others. Some also have concerns about deceptive trade practices, like being initially promised coverage but then being denied by the insurer based on the federal illegality of cannabis.

This occurred in the Green Earth Wellness Center LLC v. Atain Specialty Insurance Company lawsuit. Green Earth, a retail medical marijuana business in Colorado Springs, CO, attained commercial insurance for its business from Atain effective on June 29, 2012. Several days later, Green Earth contended that the smoke and ash from a nearby fire caused damage to its ventilation system, eventually damaging its plants. In November 2012, Green Earth made a claim under the insurance policy to Atain. Atain denied the claim on the grounds that the policy expressly excluded coverage for contraband, and it was void as against public policy. Attain moved for summary judgment. The court agreed with Atain that possession of marijuana for distribution is a federal crime. However, Atain solely pointed to the federal statute and did not assert whether Green Earth’s operation violates Colorado law. Therefore, due to Atain’s neglect to assert that Green Earth’s operation was a violation of Colorado law, the court found that there is a genuine issue of material fact and denied Atain’s motion for summary judgment.

Ms. Wells stated that a major issue is lack of data. While cannabis has been used for thousands of years, the legal industry in the U.S. is in its infancy. We know very little about the losses and expenses associated with this industry. Ms. Wells plans to conduct a cannabis industry Cost of Risk Survey soon. Underwriting for cannabis has been extrapolating data from other industries where similarities exist. For instance, underwriters can look at pharmacies when evaluating medical cannabis and liquor stores when evaluating vape shops. Underwriting factors include third-party inspection results, security systems wired to an outside monitoring station, an adequate electrical system with proper wattage and circuits, fire suppression systems, the type of safe used for storing cash/product, motion detectors in the room where finished product is stored, membership in state trade associations, education and training of owners/operators, and use of related regulations.

2. Heard a Panel Discussion on Uncovering Obstacles to Offering Coverage

Ms. Brown asked what additionally needs to happen at state and federal levels to make insurers comfortable entering the cannabis insurance industry. She also asked if this would likely be under this administration.

Ian Stewart (Wilson Elser) stated that the status quo is not sustainable. There must be some clarity of cannabis’ legality at the federal level. There have been comments from democratic senators that they should not allow a vote on the Secure and Fair...
Enforcement (SAFE) Banking Act without a broader social equity and social justice provisions. Arguably the most conservative U.S. Supreme Court justice, Clarence Thomas, criticized the federal ban on marijuana and the U.S. government’s inconsistent enforcement in a statement a couple weeks ago, questioning whether the government has the authority to “intrude on” state-legal cannabis markets. This indicates that time is limited for the U.S. Congress (Congress) to act before the U.S. Supreme Court does so. For carriers, Schedule One of the Controlled Substances Act (CSA) is the largest hinderance because it prevents primary protection of its banking relationships. The directives in the proposed U.S. Senate (Senate) bill for the federal government to study cannabis are needed to increase the data available to insurers.

Ms. Brown asked what additional actuarial and experience data is needed to help insurers write cannabis-related business coverages.

Tim McCarthy (Insurance Services Office—ISO) stated that cannabis is an emerging type of risk, and more public data on it is needed to better analyze information on a state-by-state basis because operations differ so much by state. It may take several years before there are sufficient court cases for products liability. Long-term studies on the impacts of cannabis are also needed. The ISO has introduced 10 new classifications related to cannabis that will be implemented in 40 jurisdictions later this year. The ISO will begin to collect data next month related to this to more uniformly analyze and update its commercial general liability cost information.

Lois J. Massa (G.J. Sullivan Co. Reinsurance—GJS Re) stated that in lieu of lack of data, carriers are benchmarking to similar industries and/or evaluating and aggregating their own data.

Ms. Brown asked how reputational concerns factor into insurers and reinsurers’ willingness to participate in the cannabis space.

Mr. Stewart stated that reputational concerns are still relevant, but much less of a concern than they were just a couple years ago. Marijuana has become socially accepted over the past year or two. Conservative states are now enacting adult-use cannabis laws very quickly. However, a positional schism is beginning to form in the cannabis community between the regulated marijuana market and the hemp-derivatives market. There is reputation risk in hemp derivatives because they are not laboratory tested and regulated the same way as regulated cannabis companies’ products.

Ms. Massa agreed and said the greater acceptance of cannabis is due to the cannabis industry’s educational efforts. However, the impact of future claims going to court will determine if this industry sees payouts that might affect reputational risk. This happened with the liquor industry a decade ago. The Juul vaping case is a good example of this.

Michael Hall (Golden Bear) stated that many of the countries that the global reinsurers are from still view cannabis as an illicit drug. As a result, the global reinsurers have great concern on reputational risks that may stem from bad press in their respective countries.

Ms. Brown stated that Lloyd’s of London stopped insuring in the U.S. cannabis industry due to the continuing legal uncertainty. She asked what this had on the insurers ability to buy reinsurance.

Ms. Massa stated that Lloyds’s syndicates had been the lead cannabis writers in the U.S. in 2015 because they are regulated by one entity. They decided as a group collectively to withdraw from the U.S. market due to legal uncertainty at the federal and state levels and concerns about U.S. banking regulations. The impact in the U.S. was on primary coverage and reinsurance support, as Lloyds provided both. It was temporarily difficult to get primary policies; then, companies such as Golden Bear and James River stepped in to fill the void. Most global reinsurers are not based in the U.S. and operating in the U.S. cannabis market due to the aforementioned concerns. However, there is some exposure to cannabis through reinsuring portfolios. In October 2018, Canada passed the federal Cannabis Act. The bill amended the criminal code to remove it from the CSA, established cannabis operations as legal in Canada (only the second country to do so), and put in place a series of regulations to manage it in a similar manner as liquor liability. As a result, Lloyds’s and global reinsurers have entered their market. Some U.S. companies have bought or established Canadian carriers to write cannabis.

Ms. Brown asked to what extent exclusions and reinsurance contracts are impeding carriers’ abilities to offer coverage to cannabis-related businesses.
Ms. Massa stated that reinsurance is insurance that insurance companies buy. So, insurers can choose to hold the risk on their books, but it is not advisable. There have been 30–40 new fronting companies in the past two years. There is some global reinsurance support through large treaty arrangements that include other pieces of business. However, reinsurance is difficult to obtain for new carriers.

Mr. Hall stated that the Bermuda Monetary Authority (BMA) issued a statement to reinsurers in late-2019, encouraging them to enter the now legal cannabis market in Canada. This implied to reinsurers that they should not enter markets, like the U.S., where cannabis still remains federally illegal. The result was a freeze in reinsurance capacity in the U.S. for cannabis operators.

3. Heard a Panel Discussion on Insurance Challenges

Ms. Brown asked what factors drive the lack of capacity for organizational coverage.

Norman Ives (Amwins) stated that the cannabis industry has been experiencing the same trends as the general insurance industry, just to a greater extent. The insurance market has been hardening. Professional lines risks were significantly affected when the Cole Memorandum was rescinded in January 2018. The market almost shrank in half overnight and rates rose. Since this time, the market has hardened.

Mr. Stewart stated that cannabis is a hard market inside of a hard market, especially for coverages like directors and officers. Compliance is very difficult for many of these companies leading to an uptick in securities litigation, shareholder and derivative suits, investor disputes and allegations of mismanagement actions by regulators. These cases are expensive and caused by the chaos surrounding the disparate regulations and lack of traditional financing. This leaves companies seeking private investment where they need to disclose all risks in a memo to investors, which is extremely difficult to do and leads to predictions that do not come to fruition. The genesis of the current suits is the foreign exchanges and reverse takeovers occurring in a very fragmented environment. A study in late-2000 by Stanford Law School found that there were 2008 securities class action lawsuits filed against U.S. and Canadian cannabis businesses. However, the majority of the suits had been filed within the previous two years. The filings are for failing to disclose weak demand for products, misstating inventory, failing to report operational problems, making revised earning reports that cause a stock drop, and allegedly misleading investors about contamination issues. There is a magnifying glass over the cannabis industry, resulting in several lawsuits all at once. Federal legalization in the form of the SAFE Banking Act could have a very positive impact because companies would start to operate more similarly to other industries. However, broad federal legalization may result in a temporary period of increased chaos due to the introduction of interstate commerce.

Ms. Brown stated that there are definite parallels between how insurance is regulated by states and how cannabis state-based regulation is evolving. She asked if there are gaps in products liability insurance coverage for cannabis-related businesses.

Mr. Stewart stated that the science and products are being developed concurrently, making it difficult to know what is unreasonably dangerous. This makes it hard for juries who must make decisions in product liability suits. There is a developing standard of care around agreed standards but not enough case law. The cannabis industry could see large uninsured risks materialize as tort cases get filed in the coming years. Recent science findings on vascular conditions arising out of high tetrahydrocannabinol (THC) edible products. However, insurance companies usually do good at insulating themselves with certain types of exclusions.

Mr. Hall stated that the cannabis industry has uninsured risks related to long-tail liability. Some carriers are covering things like mental illness, knowingly or unknowingly, and others are excluding it. There is a gap in the perception of what is covered and what is actually covered once you read deep into the 100-page policy.

Ms. Brown asked about products liability coverage for cannabis businesses.

Beth Medvedev (James River) stated that cannabis is very similar to other products, and underwriters can leverage similarities. One issue James River has encountered is that the industry is so unique it must anticipate the coverages. For example, on-site consumption cafes are not quite the same as alcohol because there is not a test to determine how much a person is impaired by cannabis. It is difficult to determine the effect of someone eating an edible on site and then leaving 30 minutes later. In the absence of a full understanding of all the risks, insurers may be covering unanticipated risks. Carriers also differ in their interpretations of coverage, like health hazard forms. Another issue is cannabis insureds must be aware of how the language in standard policy forms needs to be modified to remove exclusions for federal legal issues, or they could potentially face a declination of a claim.
Ms. Brown asked if there are alternate arrangements being developed or already being used in the market.

Mr. Stewart stated that there has been an increased interest in fronting over the past year. The market has also seen single cell captives being domiciled in a few states and offshore and some cannabis-specific group captives.

Mr. Ives asked Mr. Stewart if its federal legalization was needed before more progress occurs with captive risk retention groups (RRGs).

Mr. Stewart said there has been a natural reluctance to move money offshore because it gives people the impression of money laundering. There needs to be a banking solution. State insurance departments would likely have a greater comfort level with regard to actively domiciling cannabis captives if there was more certainty at the federal level.

Ms. Brown asked what risks in the cannabis industry affects property coverage.

Summer J. Jenkins (National Cannabis Industry Association [NCIA] and Cannasure) stated that an underwriter would consider the known risks. This would include anything that would increase frequency or severity of the loss; i.e., construction, occupancy, protection, and class exposure. Factors that will increase the frequency and severity include wind, hail, crime zone, and types of controls in place. Many of these questions are answered by the law. Cannabis businesses must have safe volts and multiple secured access and entry points for areas where cash is stored. Unique to the cannabis industry is that businesses tend to be cash based. They also grow much more rapidly than other businesses, making business income an important factor. This could lead to their potential loss of revenue exceeding the amount of all other covered property from an insurance standpoint. Some carriers have a coinsurance penalty.

Mr. Hall stated that oftentimes, a fast-growing cannabis-related business will find it is maxed out on the capacity it has with its primary carrier. This is the main property exposure in the cannabis industry.

Mr. Stewart asked what can be done in cases where there is a disconnect between what was written and when the claim comes in the insured finds its underinsured.

Mr. Hall stated that some of the issue lies in educating brokers. However, the largest issue is businesses in this industry foregoing insurance because it is so expensive.

Ms. Jenkins stated that there are some coverage forms in the market for things like peak season limit endorsements, fluctuating valuation endorsements, and monthly reporting endorsements. The issue is carriers being able to navigate the administrative hurdles to implement them.

Peg Brown stated that if it were legal, there would likely be a lot of interest in interstate commerce for cannabis between California and Colorado.

Mr. Stewart stated that once interstate commerce is allowed, there is likely to be an increase in confusion due to the different state regulatory structures that require different things for their distributors. For example, in California, there are requirements that the vehicle must have a security cage or other type of protective equipment installed in the vehicle. There are restrictions that require drivers to be an employee of a certain age. Insurance provisions often go off what is required in the state. This can be an issue for cannabis businesses because they often only focus on complying with state regulations and do not read their policies. A problem will arise when the business operates in multiple states with just one system for its various distributors. The solution lies in achieving more consistency between state regulations.

4. **Heard a Panel Discussion on What the Horizon Looks Like and How State Insurance Regulators Can Help**

Ms. Michael asked how coverage will evolve from the surplus market to the admitted market in the coming years. She also asked if there was something that could be done to encourage this process.

Ms. Wells stated that it would take a long time for the admitted market to want to provide coverage to some of the exposures in the cannabis industry. It would need sufficient data in addition to a federal solution. Liquor liability coverage is still being provided for by the nonadmitted market.

Ms. Michael asked how cannabis businesses find insurers willing to provide coverage.
Mr. Ives stated that the internet is a good source to find information on insurers in the cannabis space. He also recommended that state insurance regulators provide a list of brokers similar to the one the California Department of Insurance (DOI) provides online.

Ms. Michael asked what supportive measures state insurance regulators can provide when reinsurance conditions and federal laws change.

Ms. Jenkins stated that state insurance regulators can help by making the filing rate approval process much easier, providing more clarifying documents, and implementing a more expedient process.

Ms. Medvedev stated support for promoting those regulations in the industry to attract more insurers and reinsurers into the market. The major hurdle is having more options of insurance coverage.

Ms. Michael asked how the NAIC can support availability and affordability of coverage.

Mr. Hall stated that lack of data currently has insurers making educated guesses. Providing more flexibility inside rate filings for rates to increase or decrease would allow more insurers to feel comfortable entering the market.

Ms. Jenkins stated that the availability of forms and rate justifications are big issues because of the nature of the industry. It would be greatly helpful if state insurance regulators established justification reasoning requirements more representative of the tenure of the industry. It would also be helpful if state insurance regulators accepted data from a similar industry in lieu of data that is directly applicable.

Ms. Medvedev stated that it is important that states remain welcoming to nonadmitted carriers, as they provide an important service to emerging industries by having more flexibility.

Ms. Michael asked what innovation can facilitate better availability of coverage.

Ms. Wells stated that it really all comes down to changes with federal regulation.

Ms. Michael asked how support for legalized cannabis will evolve in the future.

Ms. Wells stated that Pew Research’s April poll showed over 90% of the U.S. population thinks cannabis should be legal in some form. However, there are well-funded campaigns pushing against its legalization.

Ms. Michael asked what private solutions exist for crop insurance.

Mr. Ives stated that the federal government allowed crop coverage to be available for hemp crops for the first time last year, but only if the insured had grown crops the previous year. The crop coverage that is available would not benefit businesses growing hemp or cannabidiol (CBD) products for human or animal consumption. Crop programs are based around a federal program and the commercial insurance policies available for crop are supplemental to coverage provided through the federal program. There will not be much movement on agricultural product coverage until there is a federal crop program that is really viable for hemp farmers. The only programs currently offered for crop coverage are parametric programs, which are very limited risk-specific programs.

Mr. Bradner asked if it would be likely that the tobacco and alcohol industry would enter the cannabis industry once the federal illegality is no longer an issue. He also asked if there is anything to learn from Canada’s legalization of recreational cannabis.

Ms. Wells stated that the tobacco and alcohol industry are already diversifying into the space with things like infused alcohol drinks. They are also a force against the legalization of cannabis for competitive reasons.

Mr. Stewart stated that both industries are involved, and there will likely be a coalescent around a smaller number of brands in the future. The focus of the alcohol industry is to get control of those brands. Canada is regulated very differently than what federal regulation will end up looking like in the U.S.

Kristen Augustine (Colorado Marijuana Enforcement Division) asked if a business owner would be considered higher risk if he/she has a felony record for unlawful distribution.
Ms. Jenkins stated that from an underwriting standpoint, it is illegal to discriminate or give someone preference based on their application status. But underwriters can provide things like association membership or rating credits that apply directly to the decrease of exposure on the risk. In some instances, carriers will offer a 10% credit for social equity applicants that are also members of a trade association. Trade association members are required to go through more rigorous training. Underwriting is based a lot on the underwriter’s personal perceptions.

Ms. Medvedev stated that it depends on the risk, the offense, and how much it affects what is being done. Offenses, such as embezzlement, would be looked at as a moral offense.

Mr. Yardley asked how valid experience data develops in the absence of a federal solution.

Ms. Medvedev stated that individual carriers will have their own data and experience. There is also a part of underwriting that looks at where lawsuits and claims are occurring.

Mr. Ives stated that it can be difficult to try to aggregate data, as claim data is still proprietary. Aggregating litigation data can be difficult because many state courts do not provide searchable databases. States need to provide good state-level data on cannabis regulatory schemes. Traceability systems and reporting capabilities within the states need to be upgraded to generate usable data, such as gross sales. The Washington State Liquor and Cannabis Board (WSLCB) makes this type of information available.

Mr. Bradner asked if the information is obtainable though a Freedom of Information Act (FOIA) request.

Mr. Stewart stated that to a certain extent, this information can be acquired through an FOIA request, but it would be time consuming and costly. The information would only be provided through redacted records, and there are some privacy concerns. California coordinated through its various agencies to amend regulations to make it easier to share data that insurers and banks need, such as the owners, financial interest holders, and background information. This has provided marked improvement in the turnaround time and amount of data that is provided to ancillary service providers. What is allowed to be disclosed and the system set-up varies by state.

Ms. Brown stated that state insurance regulators may need to take up coordinating with sister state agencies and the Cannabis Regulators Association (CANNRA) to help provide the needed data to the insurance industry.

Having no further business, the Cannabis Insurance (C) Working Group adjourned.
The Cannabis Insurance (C) Working Group of the Property and Casualty Insurance (C) Committee met July 19, 2021. The following Working Group members participated: Ricardo Lara, Chair, represented by Melerie Michael (CA); Michael Conway, Vice Chair, represented by Peg Brown (CO); Jimmy Harris (AR); Angela King (DC); C.J. Metcalf (IL); Marlene Caride represented by Randall Currier (NJ); Gennady Stolyarov (NV); Andrew Schallhorn (OK); John Lacek (PA); Elizabeth Kelleher Dwyer (RI); Christina Rouleau (VT); and Michael Walker (WA).

1. Heard a Presentation on the Geographical Expansion of States Legalizing Cannabis and its Impact at the Federal Level

Ms. Michael stated that the first day of the Fact-Finding Hearing on Insurance for Cannabis-Related Businesses will focus on setting the cannabis stage and insurance product availability. In 2017, the California Department of Insurance (DOI) held the nation’s first public hearing for cannabis insurance and approved the nation’s first admitted carrier, Golden Bear, to write cannabis insurance products in California. Two years later, the Working Group adopted its white paper, Understanding the Market for Cannabis Insurance. As much has transpired in this industry over the last decade, the Working Group will use the information gained over its two-day hearing to update the white paper through the addition of an appendix. The Working Group also plans to leverage the feedback gained from the hearing to discuss how state insurance regulators can better collaborate with each other and other regulatory agencies.

Ian Stewart (Wilson Elser) stated that nearly all Americans now live in a state where some form of cannabis is legal. Additionally, over 90% of Americans believe cannabis should be legal either for adult or medical use. The geographic expansion of state cannabis markets now includes 18 states and Guam legalizing cannabis for adult use and 37 states; Washington, DC; Puerto Rico; Guam; and the U.S. Virgin Islands legalizing cannabis for medical use. Since last November, 10 states have passed new adult-use or medical cannabis laws, including Alabama, Arizona, Connecticut, New Jersey, New Mexico, New York, Mississippi, Montana, South Dakota, and Virginia. In 2021, six states have passed expansions to their medical cannabis regulations, including Georgia, Louisiana, Minnesota, Pennsylvania, Tennessee, and Texas. Adult-use legislation is currently being considered in Delaware, Florida, Hawaii, Iowa, Maryland, Minnesota, North Carolina, North Dakota, Pennsylvania, Rhode Island, and Wisconsin. Adult-use ballot initiatives in 2022 are expected in Arkansas, Florida, Missouri, Ohio, and Oklahoma.

The Cannabis Administration and Opportunity Act is a draft bill released by Sen. Chuck Schumer (D-NY), Sen. Cory Booker (D-NJ), and Sen. Ron Wyden (D-OR) on July 14 to remove marijuana from Schedule 1 of the Controlled Substances Act (CSA) and have it regulated similar to alcohol. This would allow states to determine their own cannabis laws and transfer federal agency jurisdiction from the Drug Enforcement Administration (DEA) to the U.S. Food and Drug Administration (FDA), the U.S. Department of Health and Human Services (HHS), Alcohol and Tobacco Tax and Trade Bureau (TTB), and Bureau of Alcohol, Tobacco, Firearms and Explosives (ATF). It would also lift restrictions on research and direct various federal agencies and departments to study and report on cannabis. It automatically expunges criminal convictions for non-violent marijuana offenses. Grant programs would be established for non-profits, small business loans, and state funding to assist individuals disproportionately affected by the war on drugs. It would levy federal excise tax on cannabis products and establish a federal track and trace regime. Interstate commerce would be restricted for cannabis products that fail to comply with mandated packaging and labeling requirements. A legal pathway would be created for Cannabidiol (CBD) in dietary supplements with a maximum recommended daily serving. It would also establish a process for delivery of inadvertent “hot hemp” to a licensed cannabis operator for processing.

2. Heard a Presentation on the Cannabis Business Regulatory and Licensing Landscape

Norman Birenbaum (Cannabis Regulators Association—CANNRA) stated that the CANNRA is a national organization of cannabis regulators that provides policy makers and regulatory agencies with the resources to make informed decisions when considering whether and how to legalize and regulate cannabis. Its members are the primary regulatory agencies and officials charged with the oversight of adult-use cannabis and/or medical cannabis in Arizona; California; Colorado; Connecticut; Delaware; Florida; Georgia; Hawaii; Illinois; Iowa; Louisiana; Maine; Maryland; Massachusetts; Michigan; Minnesota; Montana; Nevada; New Jersey; New York; North Dakota; Oregon; Rhode Island; South Dakota; Utah; Washington; and
Washington, DC. Each of the 36 states and four territories that have legalized some form of cannabis have their own unique regulatory framework. Licensed activities, tax mechanisms and rates, market structure, the role of local governments, marketing and advertising, approved qualifying medical conditions, and many more regulatory issues vary greatly between jurisdictions. As an association, CANNRA brings states together, even with varying regulatory frameworks, to discuss shared challenges and identify best practices in cannabis regulation.

The evolution in federal oversight and how standards are created has really affected the work of CANNRA. This included shifts from voter initiatives to legislative process and U.S. Department of Justice (DOJ) enforcement to U.S. Department of the Treasury (Treasury Department) compliance. There is a trend of states pushing back against federal initiatives, particularly around background checks and past criminal history, to embrace social and economic equity priorities around the cannabis industry and licensing. The U.S. is now entering into a stage of learning from other jurisdictions. CANNRA members often discuss how they are moving towards product standards, including everything from packaging to labeling. Testing and product safety regulations vary greatly between states in terms of what is being tested and how it is being tested. This includes how labs are credentialed and how different action levels and limits around mold microbials, pesticide residual solvents, and heavy metal toxicity are determined. Sampling processes and procedures also vary between jurisdictions. Additional issues include how to perform cross jurisdiction verification if there is change at the federal level to make sure there are consistency and good regulatory tools for product recalls and administrative action. The labs are the hardest in the cannabis space to regulate because of the nature of the testing and the competition amongst labs for market share. E-cigarette or vaping use-associated lung injury (EVALI) was identified in 2019 by the federal Centers for Disease Control and Prevention (CDC) as a dangerous lung disease linked to vaping. The plethora of young people becoming seriously ill after vaping prompted a wave of regulations that changed the landscape. States are also issuing policy statements or regulations prohibiting delta-8 tetrahydrocannabinol (THC) and other intoxicating synthetic isomers of CBD currently being marketed as legal because the 2018 Farm Bill legalized hemp extracts.

Tax structures is an area that has produced some of the greatest variations and new innovations over the last year. Initial tax structures were mostly based on ad valorem tax rates and the value at the point of sale. Over the past three years, this has transitioned to using potency or THC concentration to determine the tax rate. This has prompted conversations with stakeholders on whether the tax rate, given limited supply and unlimited distribution in the initial years when prices are the highest, affects the overall price for the consumer or just the margins of the licensees. There was a huge increase in medical and adult-use cannabis delivery services in the wake of the pandemic. There is an emerging trend of social consumption licenses. Policy considerations for this include federal indoor clean air protections, providing a location for consuming that does not conflict with federal restrictions like federal subsidized housing, and public health considerations. Market architecture and licensing is something states are taking a more aggressive stance on, particularly here in New York. In New York, if you are involved in the cultivation manufacturing or wholesale distribution, you cannot be involved in the retail distribution of the product, outside of a few exceptions. States struggle with public health and education programs because the revenue is typically based off sales, which take up to 18 months to realize. This makes it hard to establish baseline data and perform ongoing monitoring of use rates and outcomes. States struggle with issues of workplace impairment and driving under the influence. This is a shift away from per se limits because cannabis-related products affect everyone differently based on individual usage and metabolic rate. There is no breath analyzer equivalent for cannabis, and much research will be needed to develop one.

Social and economic equity is becoming the linchpin in passing legislation. How this is defined is of great deliberation. Jurisdictions have shared that providing someone with prioritization and licensing does not guarantee them access to that license, especially in jurisdictions where there are dual licensing structures. Additionally, access to a license does not equate to market share and capital access. Due to a lack of guidance from the federal government, states are working with institutions to help them satisfy their due diligence requirements under the inset guidance, particularly with banking and financial services. States are speaking more with state banks around what is needed for their disclosure licensing requirements to make them more comfortable providing services to the industry. For the first time, traditional capital is being made available to certain large cannabis licensees. States are also trying to lay the groundwork for interstate commerce; i.e., uniform standards, validation, intellectual property (IP), distribution.

3. Heard a Presentation on the Cannabis Insurance Market Segments and Insurance Needs from Seed to Sale for Vertically Integrated and Niche Players

Michael Hall (Golden Bear) stated that Lloyds stepped out of the cannabis insurance business when it got its federal charter five years ago. The nonadmitted market stepped up to fill the void. Admitted insurers are hesitant to enter the market due to a lack of reinsurance and clarity of legality at the federal level. State insurance regulators have little ability to influence reinsurance, as it mostly occurs at the international level. What they can work on is building strong systems of risk management and clarifying ancillary risks, such as dram shop statutes. From an insurance perspective many regulations, like track and trace
and strict licensing rules, provide a strong starting point for risk management.

Summer J. Jenkins (National Cannabis Industry Association [NCIA] and Cannasure) stated that cannabis businesses are just like any other business in that the biggest needs for most are the basic coverages. For cultivation, nationally recognized success of the agricultural industry affords a wealth of information. Challenges include technological advancement and speed of industry developments. Some technologies like artificial intelligence (AI), nanotechnology, and the use of synthetic DNA are not contemplated in law or insurance coverages. Insurance coverages and laws should also be cognizant of the frequently changing use in types of lighting and equipment. Additionally, there is a need to address commercial and residential exposures with a coverage form that allows the agricultural industry to recognize the residential and habitational exposure blends with commercial exposure. For instance, outdoor crop is only available from nonadmitted carriers in the form of parametric coverage. There is also a need for insurance for things like vehicles or mobile equipment that are licensed for road use and are also used in the outdoor cultivation. Additionally, most policies do not address conveniences like rail and air due to federal legality. There is not much availability for environmental incidents. There is a lack of coverage for testing done by distributors. The bailment bailee-bailor protection coverage is not adequately covered in cannabis law, which makes it difficult from an insurance standpoint. Hired and non-owned auto is also a challenge, with only excess liability coverage and limits over $1 million limited or non-existent.

Mr. Hall stated that despite the wide range of retail set-ups, there has been a push recently on the nonadmitted side for coverage to transition from the wholesale brokerage market into the managing general agent (MGA) binding market. States should focus on how they can encourage admitted carriers to enter the retail space. Part of this should include clarifying shop statutes for onsite consumption lounges at retail dispensaries. Most shop laws address alcohol specifically, but not cannabis. On the manufacturing side, there is an issue with the lack of standardization and the coverage forms, particularly with valuation of product and how it is seen when multiple insurance companies are involved in handling a claim. Standardization of things, such as the current health hazard and cancer exclusions and their evaluation, will help provide clarity from an admitted perspective. A clearer more conservative approach to labeling requirements would also help attract more carrier participants.

Mr. Birenbaum said early approaches to packing and labeling included numerous different disclaimers, which made it hard for the consumer to recall any single warning because there were so many. Canadian federally funded research found that consumers wanted plain packaging and simple labeling that includes only two to three warnings. This approach is just starting to be adopted in the U.S. research from the University of Waterloo, which found that 40–50% of people who consider themselves regular cannabis users on at least a monthly basis could not identify what causes intoxication. This illustrates solutions that may seem good in a vacuum do not execute well because of the lack of education and awareness and the federal stance.

Mr. Stewart said he agrees and believes that as the science comes out, we will likely see a standard of care developing, possibly through civil tort. As with other consumer products, legal verdicts will likely influence voluntary standards over time. It could likely be a diversion between edible products and other forms of products. Things like product inserts may be on the horizon.

Mr. Birenbaum said the majority of consumers get their information from friends or budtenders. For this reason, states are starting to look at budtender certification and training programs. This would address current issues, such as budtenders recommending products to expecting and nursing women for related symptoms, because cannabis is not good for either the mom or the baby. For this reason, it is important to have robust education programs for consumers and trusted messengers, such as budtenders and medical providers. Continuing educational (CE) requirements are really important, as medical schools are just now starting to teach about the endocannabinoid system (ECS).

Kristen Augustine (Colorado Marijuana Enforcement Division) asked who is able to attend the CANNRA meetings. Mr. Birenbaum said CANNRA voting members are the primary state regulatory agencies and offices overseeing cannabis. Associate memberships are open to any statewide office that has anything to do with cannabis policy or regulation or intersects with it. CANNRA also has a statewide membership level that covers every statewide office within the state. Membership is not currently open to the industry or anyone who is on the commercial side of the cannabis sector.

4. **Heard a Presentation on Expanding Commercial Product Options**

Joe Lam (Insurance Services Office—ISO) stated that entities seeking cannabis coverage solutions span the entire production cycle, including cultivation, storage, manufacturing and processing, design, packaging, testing, distribution, selling, serving, dispensing, and disposal. There are three cannabis commercial general liability (CGL) options. The cannabis activity coverage aggregate limit endorsement modifies the CGL form, which includes a “cannabis activity” definition, and specifies that the
“cannabis activity” must be properly licensed and permitted by law. The cannabis exclusion with an exception for hemp subject to the hemp aggregate limit endorsement modifies the CGL coverage form and provides coverage for bodily injury, property damage, personal and advertising injury (P&AI) arising out of hemp products and select offenses. Cannabis exclusion with designated product or work exception subject to cannabis products/completed operations aggregate limit modifies the CGL coverage form and excludes property damage to cannabis and for bodily injury/property damage (BI/PD) included in “products-completed operations hazard” and arising out of cannabis, except for designated products or work related to cannabis (up to a limit). The cannabis coverage endorsement addresses property-related coverages for cannabis stock, business income, and extra expense, with additional provisions for deductible and valuation.

Joseph Jonas (American Association of Insurance Services—AAIS) stated that coverage exclusions related to cannabis include health hazard, contaminated or untraceable cannabis property, noncompliance with pertinent state and local regulations, onsite use or exposure, and professional/medical advice. Myths about the cannabis market include that the industry is unprofessional and inexperienced, there is no due diligence, insured compliance is impossible, no bank will work with the cannabis industry, the insurance industry is a target of federal enforcement, and carriers risk reputational damage. Cannabis insurance truths include that cannabis items and activities are insurable, coverage expectations are reasonable, and contracts are enforceable. However, unresolved legal issues and untested policy language remains an issue. There are unrealized liability trends and unanticipated exposures, with risks and exposures varying significantly among businesses and locations. Insurance solutions include increasing admitted carrier participation; standardizing programs; and working with state insurance regulators, trade organizations, and interested carriers. The AAIS business owner’s policy offers an existing program rate modification based on industry analogues (e.g., pharmaceutical, liquor, tobacco, etc.), informed by state laws, licenses, and regulatory structure. Judgmental rates will be adjusted as loss data becomes more prevalent.

5. Heard a Panel Discussion on Admitted and Nonadmitted Coverage Across the Cannabis Business Sectors

Ms. Brown asked if cannabis business insurance will evolve from the surplus to the admitted market.

Mr. Hall stated that there is no question that eventually coverage for cannabis-related businesses will move from the nonadmitted to the admitted market. There are several companies who provided reinsurance to cannabis-related insurers moving from not wanting anyone to know who they are to openly putting out their name on applications. The retail side of the business will likely be the first to move to the admitted market. Admitted coverage would also be a good fit for dispensary exposures that are serving only as a point of distribution for others’ goods. Products coverage are likely to follow a pick-and-choose type of evolution due to the lack of uniformity of risks across the industry.

Ms. Jenkins agreed that coverage of dispensaries or production-only agricultural that does not involve extraction are natural fits for the admitted market. However, complex extraction risks that involve working with different solvents would not be a good fit for the admitted market.

Ms. Brown asked what insurance product is most available to obtain in the surplus and admitted markets.

Mr. Hall stated that general liability coverage is easily available in the nonadmitted market. However, Golden Bear and two other smaller insurers are the only admitted carriers. Several of the ancillary lines, such as earthquake and storm are almost totally unavailable. Cannabis businesses are starting to look for these coverages as they get larger, but they are unable to find them.

Ms. Jenkins stated that premise operations is the most available coverage type, followed by workers’ compensation and products liability. Product liability coverage is more complex because all the coverage forms and risks being insured differ greatly by carrier. More flexibility and availability of property coverage is needed.

Ms. Brown asked what insurance product is the most difficult to obtain for cannabis industry clients.

Ms. Jenkins stated that some of the ancillary lines and management liability-type coverages are not available. Coverage forms that detail where the ownership is transferred via some type of mechanism is also not available. Warehouse and move-people liability coverage is only available from a few carriers. This leaves it up to each carrier to make their own determinations as to who the real ownership lies with when a claim occurs.

Norman Ives (Amwins) stated that consumption lounges and spaces are an area very underserved in the casualty space.
Coverage is only available to consumption spaces directly attached to a manufacturer making a product that is distributed onsite or a dispensary providing onsite consumption for standalone consumption spaces. Despite the expansion of delivery services, there is a lack of coverage for this exposure. Most casualty placements in the cannabis space are limited to designated premises. A delivery exposure where an employee is going offsite to deliver cannabis to a consumer is a largely uncovered exposure right now.

Ms. Brown asked what type of pricing issues are being found.

Beth Medvedev (James River) stated that when James River first came into the cannabis market, there was very little information to use for pricing. She leveraged research on the cannabis industry and her pharmaceuticals and clinical trials background to find similarities in her underwriting. Rates were high at first because of the numerous unknowns and need to satisfy their reinsurers’ concerns. Marijuana is a very profitable business and a good book of business for James River, given it had few claims in its seven years of writing adult-use coverage. As a nonadmitted insurer, they can lower their rates without regulatory approval, and they have done so in states with stricter regulations.

Mr. Hall stated that Golden Bear is in the process of providing a refund to lower its rates. More flexibility in rate ranges would encourage more admitted carriers to enter the market.

Ms. Brown asked what changes in coverage availability and market participants have occurred over the last decade.

Ms. Jenkins stated that over the last three to five years, the cannabis industry has become recognized as a viable and thriving industry that can add value to our political and economic system. The coverage availability is evolving with this change in perception.

Mr. Ives stated that there has been a slow progression and evolution of the products that are available in the market. Carriers are starting to become more comfortable in this space, expanding their product offerings within their given segments. For example, cyber liability is now available in the market, albeit with small sub limits. It was not available at all three years ago. Significant and quick advances will occur in this market once there is clarity at the federal level.

Ms. Brown stated that vertically integrated companies must insure all aspects of the supply chain. She asked how these risks are approached differently than others that may only participate in one segment of the supply chain.

Ms. Medvedev stated that vertically integrated companies and companies operating in only one segment are not treated differently. Instead, the underwriter fully underwrites for each part of the company. If a company has cultivation, extraction, and a dispensary, the underwriter will have the information and understand the regulations for each of them. A lot of vertically integrated operations are also multi-state operations. Rates and endorsements would reflect the regulations in each state by aggregate location. The audit would be a little different in that intercompany revenues would not be counted. Companies that are vertically integrated may want to insure each piece separately. In this case, there would be a regular policy for each part of their operations.

Mr. Hall stated that Golden Bear focuses a lot on products liability exposure, especially the lack of multiple parties to share in products liability claims defense and eventually the obligation that is available. Golden Bear’s current products liability claims have the entire chain—i.e., dispensary, manufacture, and distributor—sharing in the defense costs. Since Golden Bear will likely be taking on the defense costs, vertically integrated businesses demand a slightly higher rate.

Ms. Brown asked if insurance providers prefer companies that are not vertically integrated.

Mr. Hall stated that it depends on whether the vertically integrated company has strong controls in place, is well-financed, has state-of-the-art facilities, and manages its supply chain well.

Ms. Brown asked what the hardest part about dealing with cannabis businesses seeking insurance is.

Mr. Ives stated that the lack of standardization in vocabulary in the industry can make it more difficult to speak with an insurer or broker about complex risks. The terminology is not uniform between regions or areas. Also, some cannabis companies may lack business acumen and knowledge of insurance, while some investors may fully understand insurance but lack an understanding of the cannabis industry.
Ms. Jenkins stated that it can also be difficult to help a retail agent, broker, or direct consumer understand the difference between legislative requirements and best practices for protecting a business.

Ms. Brown asked if it is difficult to explain an insurer’s data needs to a prospective insured.

Ms. Medvedev stated that James River uses a specific application for cannabis businesses that asks for all the information it needs from the insured. It is important to be very specific. For instance, the application would ask not just about quality controls, but if certain things are tested. This allows the underwriter to have all the information needed up front so they can respond promptly with a decision. James River also makes a concerted effort to educate its agents and brokers, as many lack knowledge of the cannabis industry.

Mr. Ives stated that business operators are asked for such an enormous amount of information just to begin operating that they are accustomed to providing it when insurers request it. Additionally, underwriters have become flexible and willing to work from other carriers’ applications.

Ms. Jenkins agreed that insureds are required to provide extensive information, regardless of the carrier. From a broker perspective, they make it clear to the client that the underwriter is likely to have additional questions, given the use of different vocabulary and descriptions used in the industry. Insureds understand that the few insurance carriers available are going to want to do their due diligence in this space.

Ms. Brown asked about the availability and demand for cyber-related coverage in the cannabis-related business space.

Mr. Ives stated that the average cannabis operator is not purchasing cyber coverage, despite having fairly significant cyber exposure. Some of this is due to a lack of education on the need for cyber coverage.

Ms. Brown asked about crop insurance availability, particularly in the private crop market. However, it is very limited in its defined coverages.

Mr. Hall stated that it is available on a parametric basis and through traditional federal crop insurance.

Ms. Augustine asked if having a business’ employees trained on how to be compliant with state regulations would reduce their perceived risk exposure and rates.

Ms. Medvedev stated that anytime a company puts in place measures that help it comply with regulations or reduce risk, it makes a difference in underwriting.

Ms. Brown asked if there are areas where liquor liability and cannabis can be analogized.

Mr. Hall stated that it is helpful. Ms. Jenkins added that underwriters consider what other guidelines outside of the insurance policy contract are going to control the risk. There are different ramifications for dram shop liability as it relates to consumption law for cannabis business. They can currently be drawn into a claim, whereas liability for liquor is restricted to the provider of the beverage.

Ms. Brown asked how cannabis businesses find insurers willing to provide them coverage.

Ms. Jenkins stated that there are many methods for finding insurers. California provides a list of cannabis insurers on its website. Some licensing bodies and consultants have referral networks. Agents and brokers perform a lot of marketing and use social media and blogs.

Ms. Brown asked what the impact has been from the pandemic.

Mr. Hall stated that coverage for business interruption and directors and officers has diminished and is being written on a much more restricted basis. This is largely related to reinsurers reacting to dynamics outside the U.S.

Mr. Ives stated that from a sales perspective, most cannabis businesses thrived during the pandemic since they were deemed essential businesses.
Ms. Augustine asked about the access minorities and women have in the cannabis space.

Mr. Ives stated that he believes minorities and women are indirectly affected since they tend to have less access to resources, resulting in being pushed out to more rural areas that are at higher fire risk.

Ms. Jenkins stated that social equity is a strong focal point in this space. The procurement aspect has been significantly simplified for marginalized communities.

Mr. Hall stated that underwriters are not likely to know who is submitting the application, as they are usually filed under a limited liability company name.

Ms. Brown stated that the investigation of licensure and the risk from its ownership is robust in Colorado. Mr. Hall stated that licensing checks occur at the end of the underwriting process.

Mr. Ives stated that insurance carriers are not aware of an applicant’s minority status so there is little opportunity for them to discriminate.

Ms. Medvedev stated that insurance is required to get licensed in many states, so underwriters are usually making quotes without a license and then checking later that it is in place.

Having no further business, the Cannabis Insurance (C) Working Group adjourned.
Catastrophe Insurance (C) Working Group
Virtual Meeting (in lieu of meeting at the 2021 Summer National Meeting)
July 22, 2021

The Catastrophe Insurance (C) Working Group of the Property and Casualty Insurance (C) Committee met July 22, 2021. The following Working Group members participated: Mike Chaney, Chair, David Browning, and Andy Case (MS); James A. Dodrill, Vice Chair, and Robert Grishaber (WV); Katie Hegland (AK); Brian Powell (AL); Ken Allen, Giovanni Muzzarelli, and Lynne Wehmueller (CA); George Bradner and Wanchin Chou (CT); Virginia Christy (FL); Colin M. Hayashida, Grant Shintaku, and Roland Teruya (HI); Travis Grassel (IA); Judy Mottar (IL); Heather Droge (KS); Warren Byrd and Tom Travis (LA); Matthew Mancini (MA); Joy Hatchette (MD); Carrie Couch, Leann Cox, Jo LeDuc, and Jeana Thomas (MO); Kristin Barrow and Fred Fuller (NC); Carl Sornson (NJ); Tom Botsko and Maureen Motter (OH); Cuc Nguyen and Andrew Schallhorn (OK); David Dahl and Van Pounds (OR); David Buono (PA); Segun Daramola, Elizabeth Kelleher Dwyer, and Beth Vollucci (RI); Bill Huddleston (TN); Marianne Baker and Mark Worman (TX); and David Forte (WA). Also participating were: Vincent Gosz (AZ); Sandy Anderson and Steve Klebba (MN); Eric Dunning (NE); Bogdanka Kurahovic (NM); Gennady Stolyarov (NV); and Donna Stewart (WY).

1. Adopted its June 21 and Spring National Meeting Minutes

Mr. Botsko made a motion, seconded by Mr. Grassel, to adopt the Working Group’s June 21 (Attachment Three-A) and March 10 (see NAIC Proceedings – Spring 2021, Property and Casualty Insurance (C) Committee, Attachment Two) minutes. The motion passed unanimously.

2. Heard an Update Regarding Federal Legislation

Brooke Stringer (NAIC) said there has not been much progress on passing a long-term National Flood Insurance Program (NFIP) reauthorization. The current extension expires Sept. 30, and there will likely be another extension put into place.

Ms. Stringer said the U.S. Senate (Senate) Committee on Banking, Housing, and Urban Affairs has held two NFIP reauthorization hearings. During last month’s hearing, Sen. John Kennedy (R-LA) and Sen. Robert Menendez (D-NJ) criticized the Federal Emergency Management Agency’s (FEMA’s) new methodology, Risk Rating 2.0, which calculates the flood risk of individual properties rather than risk by zones. Sen. Kennedy has introduced the Flood Insurance Fairness Act (S. 1960), which would require Congressional approval before FEMA could make any changes to the NFIP, including the implementation of Risk Rating 2.0. The bill has no cosponsors to date. Ranking Member Sen. Pat Toomey (R-PA) said any plan to reauthorize the NFIP should not interrupt FEMA’s implementation of Risk Rating 2.0.

Ms. Stringer said beginning Aug. 1, current NFIP policyholders can contact their insurer or agent to learn more about how Risk Rating 2.0 will affect them. The updated rates will take effect for new policies on Oct. 1 and for renewing policies on April 1, 2022. However, if a policyholder’s rate will be decreasing, they will be allowed to renew on Oct. 1 to take advantage of the lower premiums.

Ms. Stringer said in April of this year, U.S. House of Representatives (House) Committee on Financial Services Chairwoman Maxine Waters (D-CA) released a draft of the National Flood Insurance Program Reauthorization Act of 2021. This Act would reauthorize the NFIP for five years, institute a cap on premium increases of 9% per year, forgive over $20 billion in NFIP debt, and enact several other reforms. This Act also includes language to ensure that private flood insurance meets the continuous coverage requirement, so policyholders have a choice to return to the NFIP without penalty. Additionally, Rep. Nydia Velázquez (D-NY) released a draft of the NFIP Reform Act of 2021, which would modify the NFIP claims process for policyholders whose NFIP claims are denied, as well as enact other reforms.

Ms. Stringer said in May, Commissioner Andrew N. Mais (CT) testified on behalf of the NAIC at the House Committee on Financial Services’ Housing, Community Development and Insurance Subcommittee hearing entitled, “Built to Last: Examining Housing Resilience in the Face of Climate Change.” The testimony focused on the importance of mitigation to improve disaster resiliency and highlighted the work of the Climate and Resiliency (EX) Task Force. The testimony noted state insurance regulators’ partnership with FEMA and expressed support for a long-term reauthorization of the NFIP.
Ms. Stringer said Sen. Dianne Feinstein (D-CA) and Rep. Mike Thompson (D-CA) are reintroducing the Disaster Mitigation and Tax Parity Act (S. 2432), which would ensure that state-based disaster mitigation grants receive the same federal tax exemptions as federal mitigation grants. She said this is the first time the bill has been introduced in the Senate, and it is being introduced by Sen. Feinstein and Sen. Richard Burr (R-NC) as a bipartisan bill. She said this is a bill the NAIC endorsed during the last U.S. Congress (Congress), and the NAIC continues to support this bill.

Amy Bach (United Policyholders—UP) asked if the NAIC has weighed in on Risk Rating 2.0. Ms. Stringer said the NAIC continues to communicate with FEMA and receive briefings; however, the NAIC has not taken a specific position. She said this is the first time FEMA has made changes to the NFIP program since the 1970s.

3. Discussed the Status of the Catastrophe Modeling Handbook and Drafting Group Formation

Commissioner Chaney said the Working Group met last month to discuss updating the Catastrophe Modeling Handbook (Handbook). He said the referral items include: 1) understanding how state insurance regulators are currently using the Handbook and determine its practical use within the regulatory toolkit; 2) coordinating with the Catastrophe Risk (E) Subgroup to understand the materials it is developing or making available to state insurance regulators regarding catastrophe models; 3) updating questions in Section VII of the Handbook to include wildfire (resource: Application of Wildfire Mitigation to Property Exposure); 4) considering questions specific to additional perils for which catastrophe models in use today are including, such as flood; 5) denoting which questions should be directed to insurers and which questions should be directed to catastrophe modelers; 6) exploring which catastrophe modelers have begun including climate change data in their models; 7) considering alternative formats for the Handbook to be able to more easily keep it current; and 8) updating the necessary sections.

Commissioner Chaney said the drafting group will need to determine the order of completion of these items. He said perhaps the drafting group will want to start with a discussion of how state insurance regulators are currently using the Handbook. He said to date, California, Connecticut, Louisiana, and Mississippi have volunteered to be a part of the drafting group. He said there are also some interested parties that would like to help with the drafting; while they will not be official members of the drafting group, it is important for them to participate in the discussions and provide their input, as it is valuable in this endeavor.

4. Discussed Roofing Repair and the MWUA Roof Upgrade Program Implemented in Mississippi

Mr. Case said Hurricane Zeta hit the Mississippi Gulf Coast in November 2020. The hurricane was a significant event for the Mississippi Windstorm Underwriting Association (MWUA), as there were 25,000 residential property claims. Mr. Case said the best time to fortify a roof is when putting a new roof onto a structure.

Mr. Case said during the claims settlement process, the MWUA made $2,500 available to policyholders for reimbursement to upgrade to a fortified roof. He said surprisingly, Mississippi had very few policyholders take advantage of this offer. He said one of the reasons this may have happened was that it was at the height of the holiday shopping season, so availability of cash was an issue for most policyholders considering a 2–5% deductible they were already having to pay. Mr. Case said there was also the issue of the withholding of depreciation. He said these items likely contributed to the low take-up rate of the reimbursement offer.

Mr. Case said there were three hurricanes in Louisiana, one in Alabama, and one in Mississippi in 2020, and there are only a certain number of Insurance Institute Business & Home Safety (IBHS) certified roofers available on the Gulf Coast. He said Mississippi was in competition with two other states that had as much or more damage than Mississippi for these certified roofers, as well as other property claim experts. He said there was a waiting list to have a roof repaired as it was, and he believes there was some hesitancy for people to have to wait even longer for an IBHS certified roof.

Mr. Case said Mississippi applauds the efforts of the MWUA, as the idea was to mitigate homes for future events and help some policyholders back out into the admitted market.

5. Discussed Items to Help Insurers with Expedited Claims Processing

Lisa Brown (American Property Casualty Insurance Association—APCIA) said the APCIA Catastrophe Actions Toolkit is included as a part of the Working Groups materials. She said the APCIA has heard from its members regarding getting into a catastrophe area quickly to adjust and settle claims, which oftentimes results in some regulatory hurdles. She said these hurdles are outside the jurisdiction of the department of insurance (DOI), but it would like to help eliminate some of the barriers. She
said the toolkit includes a draft bulletin, and the APCIA is hoping to begin a dialog on how it can help state insurance regulators in the various states.

Ms. Brown said the APCIA has heard from its members that it has set up a mobile claims settlement location not knowing that specific permits were needed to do so. She said the APCIA has also had issues with companies needing to bring in a tanker truck with fuel to refuel claims adjuster’s vehicles at a claims settlement location, and it found that another permit was needed to do this, as well as issues with towing and salvage. She said the APCIA would like to be able to get authority for the DOI to make administrative pronouncements that fall outside of its jurisdiction or figure out ways for the DOIs to better coordinate with other state and local agencies that need to be involved. She said the draft bulletin in the toolkit is intended to address both pre-disaster preparation and recovery measures. She said the bulletin also addresses the DOI getting the claims related data and information the APCIA will inevitably need from the insurers following a catastrophic event. She said the APCIA would welcome the opportunity to work on these issues with the state insurance regulators.

Ms. Bach asked if this initiative relates to the growing offers that some insurers are notifying their policyholders about regarding the relationships they have with private firefighting agencies or providing loss mitigation in advance of a wildfire. Karen Collins (APCIA) said this is not part of the initiative being discussed today. She said the initiative the APCIA is discussing today relates to the state insurance regulator’s role in coordinating with state and local officials and what that process will look like in preparation, as well as the expedited claims processing.

Mr. Byrd asked regarding the obstacles that authorities put up for entries, how long these last. He said he assumes these are for downed power lines or items such as flooding that take longer to clear. Ms. Collins said the most recent feedback the APCIA has received is for the time immediately following a storm. She said the hurdles insurers are having are the types that are simple to overcome from a simple administrative perspective (e.g., a permit is needed that the insurer did not know about even though access to an area is ready and available). She said knowing about these items and solving them prior to a catastrophic event would help alleviate additional delays.

Ms. Hatchette said many catastrophic events are local, which causes another set of issues. She said she is happy to discuss the individual barriers that various localities might have in place. She said the DOI has a seat at the table with the emergency managers; it has been her experience that it is difficult dealing with localities, and she is not sure a bulletin will provide automatic access. Ms. Collins said the APCIA recognizes that at the local level, there is going to be a lot of variation, but the APCIA hopes to promote a standardized approach or a working model to the various emergency operations individuals and officials and educate them on where these benefits lie, might then allow the local level to overcome some of these barriers. Ms. Brown said the APCIA would like to know if there is any way that as an industry, it can help to make this process smoother for state insurance regulators and the insurance industry. She said part of the toolkit describes putting together a multi-agency response team, where state insurance regulators can talk to the transportation department, or whoever is overseeing the placement of a tanker truck and things like local event permits.

Mr. Bradner said he applauds this effort. He said he is Connecticut’s long-term recovery co-chair for FEMA’s Emergency Support Function (ESF) #14, and he encourages other states to get involved too. He said Connecticut developed a program working with its Department of Emergency Management and Homeland Security and its state and local police. He said they have a bulletin with a certification program where they can issue placards to companies and the companies can sign up well in advance of a disaster. He said they ask insurers to provide an updated list of all their emergency contacts on a yearly basis. He said the bulletin also tells insurers that if they need several placards assigned to them, they can ask for them and have them distributed now so they are ready in the event of a disaster. He said the local authorities are also familiar with the process. He said he is also the liaison for the DOI at the command center if there is an event; this allows him to quickly work with the authorities to get adjusters into the areas where they need to be.

Ms. Bach said a discussion regarding getting undisputed benefits into the hands of policyholders is related to the topic of expedited claims handling, and she would like for the Working Group to discuss this further. Commissioner Chaney said many states address the issues of pre-payment, partial payment, and additional living expenses in bulletins. He said the biggest hurdle is to be certain you have licensed adjusters and emergency orders in place to get people out into the field.

Having no further business, the Catastrophe Insurance (C) Working Group adjourned.
The Catastrophe Insurance (C) Working Group of the Property and Casualty Insurance (C) Committee met June 21, 2021. The following Working Group members participated: Mike Chaney, Chair, David Browning and Andy Case (MS); Katie Hegland (AK); Brian Powell (AL); Ken Allen, Giovanni Muzzarelli and Lynne Wehmuller (CA); George Bradner and Wanchin Chou (CT); Virginia Christy (FL); Colin M. Hayashida and Grant Shintaku (HI); Travis Grassel (IA); Reid McClintock, Judy Mottar and Julie Rachford (IL); Heather Droge (KS); Rich Piazza and Tom Travis (LA); Joy Hatchette (MD); Cynthia Amann, LeAnn Cox and Jo LeDuc (MO); Timothy Johnson (NC); Carl Sornson (NJ); Tom Botisko (OH); Andrew Schallhorn (OK); David Dahl, Ying Liu and Van Pounds (OR); David Buono (PA); Segun Daramola and Beth Vollucci (RI); Will Davis (SC); Eric Hintikka and Brian Ryder (TX); and David Forte (WA). Also participating were: Eric Dunning (NE); Maggie Dell (SD); Diane Dambach, Darcy Paskey and Mark Prodoehl (WI); and Donna Stewart (WY).

1. Discussed the Catastrophe Modeling Handbook

Commissioner Chaney said one of the Working Group’s charges is to consider edits to the Catastrophe Modeling Handbook (Handbook). He said the Working Group had plans to update the Handbook this year; however, the Climate and Resiliency (EX) Task Force recently sent a referral asking the Working Group to review the Handbook. The referral suggests some specific considerations for edits.

Aaron Brandenburg (NAIC) provided background regarding the history of the Handbook. He said the Handbook was last updated in November 2010. The narrative portion of the Handbook contains nine short sections, totaling approximately 33 pages. However, there are 18 appendices of 400 plus pages.

Mr. Brandenburg said the purpose of the Handbook is to explore catastrophe models in some detail and discuss issues that have arisen or can be expected to arise from their use. Additionally, the guidance is advisory only and not intended to be all-inclusive. The Handbook suggests areas and concepts that should be explored to become well informed about catastrophe models.

Mr. Brandenburg said Section One of the Handbook provides the purpose and background of the Handbook, as well as a brief overview of the Handbook. This section of the Handbook describes perspectives from insurers, catastrophe modelers, consumers, and state insurance regulators. While this section is written at a high level, the language is dated.

Mr. Brandenburg said Section Two provides an overview of earthquake and hurricane risks. One of the items the Working Group may want to consider is expanding the Handbook to add additional perils, as catastrophe models currently include additional perils.

Mr. Brandenburg said Section Three provides a general overview of catastrophe models. The three modules include scientific, engineering and insurance, and they provide a high-level overview of each module. The Handbook is not intended to detail all aspects of a catastrophe model but provide high-level information as it pertains to state insurance regulators.

Mr. Brandenburg said Section Four describes the model input that is entered into the models by insurers; this data is separated into exposure data and insurance data.

Mr. Brandenburg said Section Five describes the model output. The descriptions regarding output are brief and include just a few sentences for each output. The outputs include average annual losses (AALs), loss costs, distribution of losses, exceeding probability distribution, individual event losses, and historical event losses.

Mr. Brandenburg said Section Six describes the model validation and update and describes concepts, such as accuracy, comparison to historical information, input data provided by insurers, model updates, probabilistic range, real-time predictions, sensitivity, and stability.

Mr. Brandenburg said Section Seven discusses evaluating models. This section is a critical section to the Handbook. It includes general questions, questions specific to earthquakes, and questions specific to hurricanes. This section was last updated by state insurance regulatory actuaries in 2010. Mr. Brandenburg said this section will likely need to be reviewed to determine if it is
necessary to revise the questions. He said the Working Group may also want to consider if questions should focus on modelers and insurers. Currently, the questions are directed to modelers. Mr. Brandenburg said the Working Group may also want to consider which perils need to be added to the Handbook.

Mr. Brandenburg said Section Eight speaks to regulatory review and acceptance. This section includes a brief narrative on scrutinizing the process and results. It also discusses what to do with a modeler’s proprietary information and how state insurance regulators might obtain that information.

Mr. Brandenburg said Section Nine describes related activities and items to consider. This section includes actuarial standards for model use, pre-tax loss reserves for companies, and activities to consider, such as auditing company exposure data, types of education, and outreach that can be done.

Mr. Brandenburg said the appendices contain: 1) a definitions section that provides various terms related to catastrophe models; 2) model data sources and documentation published on the modelers; 3) types of output; 4) modelers’ contact information; 5) department of insurance (DOI) catastrophe contacts; 6) enacted legislation; 7) information from the Florida Commission on Hurricane Loss Projection Methodology, the California Earthquake Authority (CEA), etc.; 8) published interrogatories; and 9) state circular letters. These items are out now out of date. The Working Group may want to consider making this a living document with linked data.

Mr. Brandenburg said the Climate Risk and Resiliency (EX) Task Force asked that the purpose of the Handbook be revisited to determine its practical use within the regulatory toolkit. The Task Force also asked the Working Group to coordinate with the Catastrophe Risk (E) Subgroup. Mr. Brandenburg said he believes these were items the Working Group was planning to do in terms of discovering why the Handbook is not more widely used and how it might have better utility for state insurance regulators. The Task Force also recommended that the Working Group review Section Seven of the Handbook and consider adding to the existing questions, as well as possibly revising the existing questions.

Mr. Brandenburg said Risk Management Solutions (RMS) and the Center for Insurance Policy and Research (CIPR) collaborated on the white paper, Application of Wildfire Mitigation to Insured Property Exposure. He said the Task Force suggested that the Working Group consider including the questions found in this white paper related to wildfire, and he also suggested that the Working Group consider questions specific to additional perils for which there are catastrophe models in use today, including but not limited to, flood. He said the Task Force suggested that the questions be denoted to clarify which questions should be directed to insurers versus catastrophe modelers. He said the Task Force also recommended exploring which catastrophe modelers have included climate data in their models.

Mr. Brandenburg suggested that state insurance regulators: 1) determine why state insurance regulators are not using the Handbook; 2) discuss what is missing from the Handbook; and 3) discuss what would improve the Handbook’s usefulness.

Mr. Brandenburg said considerations for the Working Group would be to: 1) gather state insurance regulator interest on what is needed; 2) incorporate information from the Application of Wildfire Mitigation to Insured Property Exposure white paper, including what information should be obtained from the insurer and the catastrophe modeling vendor; 3) edit “Questions to Insurers/Modelers”; 4) review the American Academy of Actuaries (Academy) guidance and education on catastrophe models; 5) explore climate models; and 6) determine future updates and how to better educate state insurance regulators and ensure that they have the information needed.

Mr. Botsko said he chairs the Property and Casualty Risk-Based Capital (E) Working Group and Mr. Chou chairs the Catastrophe Risk (E) Subgroup. He said they have been in discussion about adding perils to the risk-based capital (RBC) calculation. He said he believes the tasks of both groups run parallel to some extent, and he believes the groups should coordinate about some of the things the Catastrophe Risk (E) Subgroup is considering as they add perils to the RBC calculation and how they are going to consider the validity of these models, as the models for wildfire are relatively new. He said convective storms is another peril the Catastrophe Risk (E) Subgroup is considering adding to the calculations. He said discussion about the process of how the Subgroup is going to look at the models, and the things that are going to be considered is important. The discussion will not necessarily be about approving the models, but about the process of getting the models accepted for the new perils. Commissioner Chaney suggested that it would be helpful for a couple of members to serve on the group drafting the updates for the Handbook.

Commissioner Chaney said in review, the Working Group will need to: 1) explore the catastrophe models, the way they are being used, and items that may have already been an issue or can be expected to be an issue at some time in the future; 2) add
the wildfire peril, and possibly flood and convective storms, as the Handbook is limited to earthquake and hurricane; 3) review guidance developed by the Academy; 4) coordinate with the Catastrophe Risk (E) Subgroup; and 5) consider alternative formats for the Handbook to facilitate the ability to more easily and more frequently update the Handbook.

Commissioner Chaney said he believes forming a drafting group to update the Handbook is the best way to move forward with the updates. He said the first task of the drafting group would be to review the materials included in the handouts for today’s call, which includes: 1) the Application of Wildfire Mitigation to Insured Property Exposure white paper; 2) Actuarial Standard of Practice (ASOP) 56; and 3) the Academy research. He said Working Group members may want to include in-house actuarial staff on this project to provide their expertise in this area.

Mr. Chou said a high-level overview of the catastrophe model can be educational and useful for state insurance regulators. He said the Catastrophe Risk (E) Subgroup and the Catastrophe Insurance (C) Working Group likely need to discuss the purpose of the Handbook and discuss how it can be used more effectively. He said reviewing the model itself is a complicated process. He said discussion should encompass the educational and credential parts. He said when reviewing a model, the right questions should be asked.

Commissioner Chaney said there are things happening with the climate that do not fit historic patterns, such as tropical depressions intensifying over land. He said it is going to be important to look at catastrophe models and see what needs changing.

Dennis Burke (Reinsurance Association of America—RAA) asked if the purpose of the Handbook to focus on the role of the catastrophe model helping to identify catastrophic loss is to figure out the impact on the prospect of policy and rates that will be charged, or is the catastrophe model also opening into the climate model 20, 30, 40 or 50-year analysis. He asked if it is still focused on loss costs prospective policies. He mentioned not just loss costs, but also things like preference of the warm sea surface temperature model, as several states would not allow the use of warm sea surface temperature. He said state insurance regulators need to be looking at risk and deciding what to do about the risk that is five, 10, 20 or 30 years down the road; therefore, it is important to have the Catastrophe Risk (E) Subgroup involved, because this will affect the surplus. Commissioner Chaney said the Handbook is meant to be a live tool that state insurance regulators can use consistently.

NAIC staff will follow-up with Working Group members to find drafting group volunteers.

Having no further business, the Catastrophe Insurance (C) Working Group adjourned.
The Pet Insurance (C) Working Group conducted an e-vote that concluded August 13, 2021. The following Working Group members participated: Don Beatty, Chair (VA); Kendra Zoller, Vice Chair (CA); Jimmy Harris (AR); Kris Fabian (CT); Warren Byrd (LA); Sheri Cullen (MA); Shirley Corbin (MD); LeeAnn Cox (MO); Michael McKenney (PA); Kathy Stajduhar (UT); and David Forte (WA).

1. **Adopted its Aug. 4, 2021 Meeting Minutes**

The Working Group considered adoption of its Aug. 4, 2021 meeting minutes. During its Aug. 4, 2021, meeting, the Working Group took the following action: 1) adopted a definition of wellness program to include in Section 3 of the draft model; and 2) adopted the entire Pet Insurance Model Act as drafted.

A majority of the Task Force members voted in favor of adopting the Task Force’s Aug. 4, 2021 (Attachment Four-A) The motion passed.

Having no further business, the Pet Insurance (C) Working Group adjourned.
The Pet Insurance (C) Working Group of the Property and Casualty Insurance (C) Committee met Aug. 4, 2021. The following Working Group members participated: Don Beatty, Chair, Jessica Baggarley, and Phyllis Oates (VA); Kendra Zoller, Vice Chair, and Risa Salat-Kolm (CA); Katie Hegland (AK); Jimmy Harris (AR); Kristin Fabian (CT); Angela King (DC); Warren Byrd and Tom Travis (LA); Sheri Cullen (MA); Shirley Corbin and Rasheda Chairs (MD); Michael McKenney (PA); Matt Gendron and Beth Vollucci (RI); Kathy Stajduhar (UT); Mary Block and Anna Van Fleet (VT); and David Forte, John Haworth, and Eric Slavich (WA). Also participating were: Marcia Kramer (KS); Brock Bubar (ME); Joseph Sullivan (MI); Chris Aufenthie (ND); Maggie Dell (SD); and Jody Ullman (WI).

1. **Adopted its July 29 Minutes**

The Working Group met July 29 to discuss language related to wellness plans in the draft Pet Insurance Model Act.

Mr. Byrd made a motion, seconded by Ms. Corbin, to adopt the Working Group’s July 29 minutes (Attachment Four-A1). The motion passed unanimously.

2. **Discussed the Definition of Wellness Plans in the Draft Pet Insurance Model Act**

Mr. Beatty said on its last call the Working Group adopted a new section addressing wellness programs. He said there was discussion about adding a definition of wellness programs to Section 3 – Definitions. He said Rhode Island has since submitted a revised definition. Mr. Gendron said the definition is meant to address two issues, the first being language clarifying that states have different definitions for transacting insurance. He offered language that would allow for three ways states define insurance, related to indemnification, determinable contingencies, and fortuitous events. He said states should be able to insert their own definition for insurance within this section. The second edit dealt with two-party contracts. Mr. Gendron said the new language clarifies that the definition is not meant to classify a contract between a service provider and a pet owner that only involves the two parties as insurance. Mr. Forte said the language would help clarify that the business of insurance is separate from wellness programs but if wellness vendors venture into insurance, then they fall under insurance law.

Birny Birnbaum (Center for Economic Justice—CEJ) said the model should define pet insurance as not including service providers only including two parties. He said services should not be listed in the model because there are pet insurers that provide those services. He said the model should define what pet insurance does not include. The key is whether a product or service triggers the definition of insurance within a state. He also noted that “service provider” should read “non-insurer service provider.”

Isham Jones (American Veterinary Medical Association—AVMA) said the list of services should be noted by saying “including, but not limited to.” Cari Lee (North American Pet Health Insurance Association—NAPHIA) agreed with this suggestion. Mr. Byrd said it is redundant to say “not limited to.” Mr. Beatty agreed with not including the additional language.

Mr. McKenney said the Working Group is treating wellness like service contracts. Mr. Birnbaum said there is a parallel with auto service contracts and travel insurance, and that is why pet insurance should be defined instead of wellness programs. Mr. Byrd said the list includes things done normally that are not fortuitous. Mr. Birnbaum said some are services, but some are preventative and are meant to avoid losses. For instance, a blood test might be part of a service with a condition and would not be non-insurance.

Mr. Gendron said if the language related to wellness services referred to a person, he believes it would all be insurance, and he would support Mr. Birnbaum’s definition. Lisa Brown (American Property Casualty Insurance Association—APCIA) said if the pet were human, these items would be covered under a health policy, but the policy is not health insurance. She also noted auto insurers do not pay for maintenance, but a consumer can purchase a maintenance contract. She said a wellness program for pet insurance is like a service contract.

Mr. Gendron noted that language previously adopted created the linkage between insurance and a wellness program by listing requirements for a wellness program to be marketed and sold alongside a pet insurance policy by a licensed insurance entity.
Mr. Gendron made a motion, seconded by Mr. McKenney, to adopt the following language to be added to the Definitions section of the model:

“Wellness program” means a subscription or reimbursement-based program that is separate from an insurance policy, that provides goods and services to promote the general health, safety, or wellbeing of the pet. These goods and services include wellness exams, fecal tests, blood tests, vaccinations/titers, preventive medications for fleas, ticks, and heartworm, dental cleaning, spay and neuter procedures, nail trimming, grooming, and licensing tags. If any wellness program [insert state trigger for insurance contracts, which might include [undertakes to indemnify another], or [pay a specified amount upon determinable contingencies] or [provides coverage for a fortuitous event]], it is transacting in the business of insurance and is subject to the insurance code. This definition is not intended to classify a contract directly between a service provider and a pet owner that only involves the two parties as being “the business of insurance,” unless other indications of insurance also exist.

The motion passed unanimously.

Mr. Gendron made a motion, seconded by Ms. King, to adopt the entire Pet Insurance Model Act as drafted. The motion passed unanimously.

Having no further business, the Pet Insurance (C) Working Group adjourned.

W:\National Meetings\2021\Summer\Cmte\C\PetInsWG\PetInsWG_0804min.docx
The Pet Insurance (C) Working Group of the Property and Casualty Insurance (C) Committee met July 29, 2021. The following Working Group members participated: Don Beatty, Chair, Jessica Baggarley, and Phyllis Oates (VA); Andrew Gulcher (CA); Katie Hegland (AK); Jimmy Harris (AR); Kristin Fabian (CT); Warren Byrd (LA); Sheri Cullen (MA); Rasheda Chairs and Linas Glemza (MD); Jo LeDuc and Patrick Lennon (MO); Michael McKenney (PA); Matt Gendron (RI); Jamie Gile, Mary Block, and Anna Van Fleet (VT); and David Forte and Eric Slavich (WA). Also participating were: Linda Grant (IN); Heather Droge, Tate Flott, and Shannon Lloyd (KS); Brock Bubar and Sandra Darby (ME); Christine Peters (MN); Chris Aufenthie, Chrystal Bartuska, and Ross Hartley (ND); Maggie Dell (SD); and Jody Ullman (WI).

1. Adopted its July 22 Minutes

The Working Group met July 22 to discuss language on waiting periods, free look periods, and wellness plans in the draft Pet Insurance Model Act.

Mr. Byrd made a motion, seconded by Mr. Forte, to adopt the Working Group’s July 22 minutes (Attachment Four-A1a). The motion passed unanimously.

2. Discussed Adding Wellness Plans Language to the Draft Pet Insurance Model Act

Mr. Beatty said Washington submitted comments to add language to Section 7 regarding wellness programs. Mr. Forte said the name of the section should be changed to Policy Conditions in order to address policy issues beyond pre-existing conditions and waiting periods. He said there are five issues that he would like to see addressed in this section. He said those issues are: 1) the overlap between insurance policies and certain wellness programs, 2) prescriptive and wellness elements that are included within an insurance policy, 3) insurance companies marketing supplemental wellness programs that are not part of the insurance policy, 4) non-insurance entities providing wellness programs, and 5) insurance policy eligibility for consumers being contingent on participation in a partnering wellness program. Mr. Forte said Washington is proposing a definition in Section 3 of “wellness program” in an attempt to separate insurance from non-insurance wellness products. He said Washington is proposing three new subsections in Section 7 that would read: (C) A pet insurer must not require a veterinary examination of the covered pet for the insured to have their policy renewed; (D) If a pet insurer includes any prescriptive, wellness, or non-insurance benefits in the policy form, then it is made part of the policy contract and must follow all applicable laws and regulations in the insurance code; and (E) An insured’s eligibility to purchase a pet insurance policy must not be based on participation, or lack of participation, in a separate wellness program.

Birny Birnbaum (Center for Economic Justice – CEJ) said regulators should focus on what is and is not insurance and this issue could be solved by a clearer definition of pet insurance. He said the comments submitted by CEJ and Center for Insurance Research (CIR) give a new proposed definition of pet insurance. Mr. Forte said the concern with this definition is that it expands the definition of insurance to include things that Washington would not view as insurance such as maintenance and preventative care. Mr. Birnbaum said the definition should be broad to provide uniformity across the states and to give consumers what they would expect from an insurance policy.

Isham Jones (American Veterinary Medical Association – AVMA) asked if the list of services in Washington’s proposed definition of wellness program is meant to be a finite list. Mr. Forte said the list was not meant to be finite.

Mr. McKenney said there are currently many wellness programs that are not written by an insurance company that should not now be classified as insurance. He said he does support the language proposed by Washington with the exception of the last sentence in the definition of wellness program. Mr. Forte said the intent of that sentence is important to determine if a product aligns with a state’s insurance code, but that the sentence could be re-worded. Mr. McKenney asked for clarification on the term “determinable contingency.” Mr. Gendron said at least 15 states use this term as a statutory trigger for insurance. He said it would make sense to have that term in the definition, but also add in a term to refer to the two-party contracts between a veterinarian and consumer that are not considered insurance. Mr. Forte said if the term adds confusion for certain states then the term can be removed from the definition. Mr. Birnbaum said the type of two-party contracts being discussed is referred to...
as a fee waiver. He said language addressing this exists in Model #632-1 Travel Insurance Model Act, and this working group should not try to re-invent the wheel but instead look to Model #632-1 for this language.

Mr. McKenney made a motion, seconded by Mr. Forte, to rename Section 7 to “Policy Conditions” and adopt subsections 7C, 7D, and 7E as proposed by Washington. The motion passed unanimously.

Mr. Beatty said in June, the North American Pet Health Insurance Association (NAPHIA) had submitted comments to add a new section to the model to address the sales practices of wellness programs. He said Mr. Forte had submitted a modified version of those comments for consideration to the working group. Mr. Forte said Washington removed sections of the language that directed what wellness programs could do, and focused on what insurance entities can do with insurance policies. He said this language will help a consumer understand what is part of the insurance policy when a policy and wellness program are marketed together. Cari Lee (NAPHIA) said this language is supported by NAPHIA. Mr. Birnbaum said he would not support this language.

Mr. Gendron said he does not agree with the proposed language. He said in part A, the structure and design of many wellness programs sold along side insurance policies is that of an insurance product because it indemnifies costs that are incurred at 3rd party vendors. He said in part B, he does not have regulatory authority to take action against companies selling a non-insurance wellness product. He said he does not support language that would add anything to existing rules of the Unfair Trade Practices Act. Mr. McKenney said in Pennsylvania’s Unfair Insurance Practices Act there is reference to anything of value in an insurance policy, so there is an overlap with non-insurance benefits. Mr. Forte made a motion, seconded by Mr. Byrd, to include the proposed language as a new section in the model. The motion passed, with Rhode Island opposing.

Having no further business, the Pet Insurance (C) Working Group adjourned.

W:\National Meetings\2021\Summer\Cmte\C\PetInsWG\PetInsWG_729min.docx
The Pet Insurance (C) Working Group met July 22, 2021. The following Working Group members participated: Don Beatty, Chair (VA); Kendra Zoller, Vice Chair, Andrew Gulcher, and Risa Salat-Kolm (CA); Katie Hegland (AK); Crystal Phelps (AR); Kristin Fabian (CT); Angela King (DC); Warren Byrd (LA); Sheri Cullen (MA); Shirley Corbin (MD); LeAnn Cox and Jeana Thomas (MO); Michael McKenney (PA); Matt Gendron and Beth Vollucci (RI); Jamie Gile and Mary Block (VT); and David Forte, John Haworth, and Eric Slavich (WA). Also participating were: Jimmy Gunn (AL); Linda Grant (IN); Vicki Schmidt (KS); Heather Droge, Tate Flott, and Brenda Johnson (KS); Daniel Lawson (ME); Sandy Anderson (MN); Chris Aufenthie, Chrystal Bartuska, and Janelle Middlestead (ND); Maggie Dell (SD); and Jody Ullman (WI).

1. **Adopted its July 8 Minutes**

The Working Group met July 8 to discuss language on waiting periods and free look periods in the draft Pet Insurance Model Act.

Mr. Forte made a motion, seconded by Mr. Gendron, to adopt the Working Group’s July 8 minutes (Attachment Four-A1a1). The motion passed unanimously.

2. **Discussed the Issue of Waiting Periods in the Draft Pet Insurance Model Act**

Mr. Beatty said the North American Pet Health Insurance Association (NAPHIA) submitted new proposed language that would: 1) change the language in Section 7B; 2) add three additional disclosures in Section 4; and 3) add a new definition for “orthopedic” in Section 3. Cari Lee (NAPHIA) said the submitted language was revised after discussion with the American Veterinary Medical Association (AVMA) and the revised language addressed concerns with the definition of “orthopedic” and concerns that waiting period requirements are clearly and prominently disclosed to consumers. Isham Jones (AVMA) said while there is still concern about the 120-day waiting period for orthopedic conditions, overall, the AVMA would be supportive of the proposed language.

Birny Birnbaum (Center for Economic Justice—CEJ) said he opposes any waiting period. He said the proposal of using three different waiting periods in one policy would be confusing to consumers. He said the waiting periods do not serve as a tool for adverse selection. He said the industry claims that waiting periods lead to reduced claims and lower premiums for all consumers but that the reduced claims are due to reduced coverage. He also said the use of different waiting period and preexisting condition options is too complex and that disclosures would not help alleviate confusion for consumers. Brendan Bridgeland (Center for Insurance Research—CIR) agreed with Mr. Birnbaum and said the language around waiting periods for accidents and specific conditions like “orthopedic” is too complex for the average consumer.

Mr. McKenney asked NAPHIA to explain the need for a 14-day waiting period for accidents. Ms. Lee said one reason for a specific waiting period for accidents is that some consumers will buy pet insurance after their pet has been in an accident and try to get coverage for the treatment needed due to that accident.

Mr. Forte asked what conditions insurers are seeing claims for that would necessitate a 120-day waiting period. Ms. Lee said hip dysplasia and other orthopedic conditions take time to manifest and diagnose, and she said these conditions are some of the costliest claims they cover. Dr. Jules Benson (NAPHIA) said the waiting period helps protect the insurers from conscious or unconscious adverse selection, but the insurers do see the need to cover these conditions when the develop in later policy years. Mr. Byrd asked why the policies are not priced based on the loss cost of these conditions. Ms. Lee said the waiting period is a tool to keep the price down for all consumers. She said underwriting this risk is costly and takes enough time that it would likely put off the customer from purchasing the product at all. Dr. Benson said the underwriting would still need to rely on the provided medical records.

Mr. Gendron said the waiting period is similar to a personal property floater that requires an appraisal, inspection, receipt, or some other method of verifying the items value before it is insured. He said the waiting period and veterinary exam are ways of getting the policies out to consumers without adding an additional cumbersome step.
Mr. Gendron made a motion, seconded by Mr. Byrd, to: 1) change the name of Section 7 – Pre-existing Conditions and Waiting Periods to Section 7 – Pre-Existing Conditions and Waiting Periods; 2) delete the current language in Section 7B and replace it with the proposed new language from NAPHIA’s submitted comments; and 3) insert in Section 4 the three additional disclosures from NAPHIA’s submitted comments; and 4) insert in Section 3 the definition of “orthopedic” from NAPHIA’s submitted comments. Mr. Forte made a substitute motion, seconded by Mr. McKenney, to adopt the previous motion with the following change to the proposed language in 7B: remove the 14-day waiting period for accidents and have only a 30-day waiting period for illnesses and orthopedic conditions. The motion passed, with Rhode Island opposing.

Mr. Gendron said with the new adoptions to Section 7 on waiting periods, the definition of “waiting period” in Section 3 should be changed. He said the definition should make it clear that the waiting period does not apply to policy renewals. He suggested removing the last sentence of the definition and replacing it with: “Waiting periods may not be applied to renewals of a policy.” Ms. Lee asked how this language would apply if a consumer increased his or her coverage in subsequent policy years. Mr. McKenney agreed that a consumer could buy an accident-only policy and then at renewal add illness, which would change the coverage of the policy. Ms. Fabian asked how it would be treated if another pet was added to the policy at renewal. Lisa Brown (American Property Casualty Insurance Association—APCIA) suggested using the term “coverage” instead of “policy” in the proposed language.

Mr. Gendron made a motion, seconded by Mr. Forte, to change the definition of “waiting period” in Section 3 to read “means the period of time specified in a pet insurance policy that is required to transpire before some or all of the coverage in the policy can begin. Waiting periods may not be applied to renewals of existing coverage.” The motion passed unanimously.

Ms. Lee said NAPHIA cannot support the model with the current language for waiting periods. Mr. McKenney asked if NAPHIA disagreed with the waiting period length for orthopedic conditions, accidents, or both. Ms. Lee said both waiting periods are important to the way NAPHIA companies are writing their policies. She said if the Working Group could offer more flexibility on the waiting periods, NAPHIA would be more likely to support the model. Mr. Forte said without data to support the need for longer waiting periods, it is difficult to see why those specific long waiting periods are needed.

Mr. Gendron asked, in NAPHIA’s proposed language, what is being covered if there is a 14-day waiting period for accidents and a longer waiting period for illnesses and orthopedic conditions. Ms. Lee said the premium reflects the waiting periods, so the consumer is not paying for coverage he or she is not receiving. Mr. McKenney asked if the renewal policies are more expensive because they do not have the waiting period. He also asked if a consumer initiates a veterinary exam to waive the waiting period, would the premium increase since there is no waiting period and there would be more days of coverage. Ms. Lee said she would have to get back to the Working Group on those questions.

Mr. Gendron said if the Working Group is going to revisit the waiting period issue, he would like to include a look-back period, of no more than 72 hours, for a veterinary examination that waives the waiting period.

Mr. Gendron said during the Working Group’s July 8 meeting, there was discussion on whether the free-look period should be included in the model and concern about the length of time of the free-look period. He said to address concern about the length of time of the free-look period, the language should be changed from “not less than 30 days” to “15 days.” He said there should also be language stating that the policy can be returned during the free-look period “unless the insured has submitted a claim to the insurer that has been paid.”

Mr. Gendron made a motion, seconded by Mr. McKenney, to change the language in 4G(2)(a) and 4G(2)(c) to reflect a 15-day free-look period. Mr. Byrd said actuaries in Louisiana have expressed that any length of free-look period is not actuarily sound. The motion passed, with Louisiana opposing.

4. Discussed the Issue of Wellness Plans in Pet Insurance

Mr. Beatty said the Working Group should recommend to the Property and Casualty Insurance (C) Committee that the Working Group should draft a white paper on the use of wellness plans in pet insurance, including how wellness plans are marketed and what defines the difference between wellness plans and insurance.

Ms. Zoller said she had submitted language for additional disclosures on the marketing of wellness plans and the exclusion of wellness care within the pet insurance policy.

© 2021 National Association of Insurance Commissioners 2
Mr. Forte said pet insurance needs to be well defined. He said wellness plans that are a subscription service between a veterinarian and consumer and do not include insurable items would not be regulated by state insurance departments. He said an insurance policy should not be affected by a wellness plan and that the wellness plan should be a stand-alone product.

Mr. Byrd said the greater the linkage between the wellness plan and how it is marketed, sold, and billed by an insurance company, the more it crosses over into a product that would be regulated by state insurance regulators. He said wellness plans sold and billed by veterinarians are fine, but when the wellness plan is billed on the same invoice as an insurance policy, that would create linkage. Mark Cushing (Mars Veterinary Health—MVH) agreed that veterinarian-based wellness plans are not a regulated insurance activity.

Mr. Bridgeland said it is important to define pet insurance within the model to make a clear line between insurance and wellness plans. He said the language in the model would be more effective than a white paper. Mr. Beatty said a white paper may lead to an amendment of the model, but it would bring jurisdictions together to analyze an issue and make suggestions on how to deal with the issue.

Ms. Lee said NAPHIA previously submitted comments on wellness plans that address, among other things, the marketing concerns that some Working Group members have expressed.

Having no further business, the Pet Insurance (C) Working Group adjourned.
The Pet Insurance (C) Working Group of the Property and Casualty Insurance (C) Committee met July 8, 2021. The following Working Group members participated: Don Beatty, Chair (VA); Kendra Zoller, Vice Chair (CA); Katie Hegland (AK); Crystal Phelps (AR); Kristin Fabian (CT); Angela King (DC); Warren Byrd and Tom Travis (LA); Sheri Cullen (MA); Rasheda Chairs and Shirley Corbin (MD); LeAnn Cox, Jo LeDuc, and Jeana Thomas (MO); Erin Summers (NV); Michael McKenney (PA); Matt Gendron and Beth Vollucci (RI); Kathy Stajduhar (UT); Jamie Gile and Mary Block (VT); and David Forte, John Haworth, and Eric Slavich (WA). Also participating were: Vincent Gosz (AZ); Katie Deaver (ID); Linda Grant (IN); Tate Flott (KS); Brock Bubar (ME); Sandy Anderson and Christine Peters (MN); Chris Aufenthie (ND); Tracy Burns (NE); and Maggie Dell (SD).

1. **Adopted its June 24 Minutes**

The Working Group met June 24 to discuss comments received on Section 7 of the draft Pet Insurance Model Act. The Working Group also discussed the use of wellness products in pet insurance.

Mr. Byrd made a motion, seconded by Mr. Forte, to adopt the Working Group’s June 24 minutes (Attachment Four-A1a1a). The motion passed unanimously.

2. **Discussed the Issue of Waiting Periods in the Draft Pet Insurance Model Act**

Mr. Beatty said the North American Pet Health Insurance Association (NAPHIA) submitted proposed language that would add: 1) a new section to the draft model (Section 8); 2) an additional disclosure in Section 4; and 3) a new definition for “musculoskeletal” in Section 3.

Mr. Gendron said Rhode Island had reviewed the proposed language and did not fully agree with all aspects of the language, but he said some aspects of the language did make sense to address in the model. He said it did make sense that certain conditions would require different lengths of waiting periods. He also said it made sense to add the definition of “musculoskeletal.” Cari Lee (NAPHIA) said all NAPHIA member companies are currently offering some type of waiting period for the following reasons: 1) to eliminate adverse selection; 2) to reduce the cost of the policy; and 3) to give consumers different options in the market. Ms. Lee said the NAPHIA proposal would have limits of 14-day waiting periods for accidents, 30-day waiting periods for illnesses, and 120-day waiting periods for musculoskeletal conditions. She said ideally, they would like to see 180-day waiting periods for musculoskeletal conditions. Dr. Jules Benson (Nationwide Insurance) said these musculoskeletal conditions can be costly, require chronic treatment and develop over a long period of time. He said with the timing of the presentation of musculoskeletal conditions, a 180-day waiting period would help control cost for everyone. He said a 180-day waiting period would allow more insurers to be involved in pet insurance and offer more choice for consumers looking for different pricing on policies. Ms. Lee clarified that the proposed language does include the ability for consumers to waive waiting periods, which is a practice in the industry currently. Mr. Byrd agreed that 180 days would be excessive for a waiting period from a consumer standpoint. He asked why a veterinary examination is not mandated by companies prior to the insurance being effective. Ms. Lee clarified that the proposed language does include the ability for consumers to waive waiting periods, which is a practice in the industry currently. Mr. Gendron asked if industry has data on how often musculoskeletal conditions develop in dogs. Dr. Benson said the data may be skewed due to adverse selection, but pet owners tend to seek treatment for these conditions more often than other conditions. He said the waiting period is a protection against unreasonable loss for the insurer.

Mr. Gendron said as a state insurance regulator, the 180-day waiting period is concerning for a one-year policy and the fact that consumers may not fully understand the disclosures they are presented with. Dr. Benson said if the waiting period is too restrictive, some insurers may opt to not offer coverage at all for certain conditions that would be too costly. Ms. Lee said the ability to have different length waiting periods provides variation in the market and drives competition and choice for consumers. Mr. Byrd agreed that 180 days would be excessive for a waiting period from a consumer standpoint. He asked why a veterinary examination is not mandated by companies prior to the insurance being effective. Ms. Lee said some companies do require an exam, but many do not in order to keep costs down for consumers and to avoid administrative costs for the pet insurer. She said that after a waiting period has been met in the initial policy year, there is no waiting period requirement in subsequent renewals. Mr. Byrd asked if a shorter waiting period was more likely to result in a required veterinary examination before the policy was issued. Ms. Lee said a shorter waiting period was more likely to result in an insurer excluding coverage for the condition.
Mr. McKenney said there is nothing keeping a company from writing a policy of less than one year, and it is concerning for a company to have the ability to implement a waiting period that could be almost as long as the policy period. He said it is also concerning since the industry wants the ability to write policies that do not renew, and the replacement policy would make the condition that first required a waiting period a preexisting condition. He said it would be confusing to consumers to have a policy with several different waiting periods that has coverage kick in at different times after policy inception.

Dr. Gail Golab (American Veterinary Medical Association—AVMA) said the term “musculoskeletal” should not be used in its current definition. She said the use of this term could cause issues of interpretation of the language. She said it would be best to get a different descriptor to address the issue these type of conditions. She said the AVMA and NAPHIA are working towards language that is agreeable.

Birny Birnbaum (Center for Economic Justice—CEJ) said he is opposed to any waiting period. He said in other lines of insurance, the waiting period is there to ensure that a condition continues for a minimum length of time, and it is not meant to replicate a preexisting condition exclusion. He said there should not be a waiting period for accidents. He said there is no evidence that waiting periods empower consumer choice and that waiting periods are not a tool for adverse selection like preexisting condition exclusions.

Mr. Byrd and Mr. Forte said they would oppose a free look period. Mr. Birnbaum said: 1) free look periods are a common feature in other lines of insurance; 2) free look periods cannot be invoked if a claim has been made; 3) no evidence has been offered that a free look period has large administrative costs; and 4) industry would not be willing to offer the free look period if there was a significant cost. Brendan Bridgeland (Center for Insurance Research—CIR) said the free look period is not free insurance for consumers. He said after talking with representatives from NAPHIA, he understands that there is not a hidden or significant cost for free look periods. Mr. Forte said there is an administrative cost to write a policy and in property/casualty (P/C) insurance, there is already a mechanism to return a policy and get back unearned premium. Mr. McKenney agreed that P/C products have a mechanism for pro-rata premium returns. He said insurers charge a cancellation fee for consumer-driven cancellations, and if industry is saying there is no cost to writing and cancelling policies with the free look period, then no line of insurance should have cancellation fees.

Mr. Forte made a motion, seconded by Mr. Byrd, to remove any allowance of a free look period in the model. The motion did not pass, with Arkansas, Louisiana, Pennsylvania, Utah, and Washington voting in favor, and Alaska, California, Connecticut, District of Columbia, Missouri, Nevada, Rhode Island, and Vermont voting against.

Mr. McKenney said the language in the current draft of the model says free look periods must be no less than 30 days, which could allow for up to a 364-day free look period. He suggested that the language should reflect a maximum of 30 days for a free look period. Mr. Gendron agreed with changing the language to make the free look period a maximum of 30 days. Ms. Summers said there should be a minimum length of the free look period as well. Mr. Byrd said if the free look period is not required by the language in the model, then a minimum length requirement would not be necessary. Mr. Beatty said the discussion of whether the current language mandates a free look period and any changes to the language would be continued during the Working Group’s next meeting.

Having no further business, the Pet Insurance (C) Working Group adjourned.
The Pet Insurance (C) Working Group of the Property and Casualty Insurance (C) Committee met June 24, 2021. The following Working Group members participated: Don Beatty, Chair (VA); Kendra Zoller, Vice Chair, Andrew Gulcher and Risa Salat-Kolm (CA); Jimmy Harris (AR); Kristin Fabian (CT); Angela King (DC); Warren Byrd (LA); Sheri Cullen (MA); Rasheda Chairs (MD); Carrie Couch, LeAnn Cox and Jo LeDuc (MO); Erin Summers (NV); Michael McKenney (PA); Matt Gendron and Beth Vollucci (RI); Kathy Stajduhar (UT); Rosemary Raszka (VT); and David Forte, John Haworth and Eric Slavich (WA). Also participating were: Ken Williamson (AL); Heather Droge (KS); Brock Bubar (ME); Tracy Burns (NE); Maggie Dell (SD); and Jody Ullman (WI).

1. **Adopted its June 10 Minutes**

The Working Group met June 10 to discuss comments received on Section 3 and Section 4 of the draft Pet Insurance Model Act.

Mr. Byrd made a motion, seconded by Mr. Forte, to adopt the Working Group’s June 10 minutes (Attachment Four-A1a1a1). The motion passed unanimously.

2. **Discussed Section 7 of the Draft Pet Insurance Model Act**

Mr. Beatty said the Working Group would continue to discuss comments received on open issues in the draft model.

Justin Liby (Companion Protect) said with respect to Section 7B, Companion Protect would support the industry being allowed to use both preexisting condition exclusions and waiting periods in tandem. He said both features address the issue of adverse selection; they work in different ways. He said the waiting period prevents a claim from being covered under the insurance agreement portion of an insurance policy and is designed to identify those conditions that are likely to become a preexisting condition. He said a preexisting condition exclusion only applies after a claim is determined to be covered under the insuring agreement and may not be limited to a specific time period. He said Companion Protect would be opposed to a cap on the duration of a waiting period. He said that if there is appropriate disclosure of the duration of the waiting period and what it applies to, then consumers can choose the best product for themselves at the right price. Mr. Byrd asked for an explanation on why a company would oppose a cap on the length of the waiting period. Mr. Liby said Companion Protect would like the ability to be more creative and deliver a product to the marketplace that a consumer might want.

Jack Chaskey (Companion Protect) said the products would be filed for approval with state insurance regulators, and the related pricing would be commensurate with the relative waiting period. Mr. McKenney said many states do not have prior approval authority. Ms. Cox asked if any states had specific statutes or regulation that speak directly to the time frames for waiting periods. Mr. Byrd said the National Flood Insurance Program (NFIP) has a mandatory 30-day waiting period for flood insurance. Mr. Gendron said he would have a problem with a waiting period longer than 30 days. He said it would make more sense for the company to exclude the condition entirely rather than have a long waiting period. He said he is in favor of allowing both preexisting condition exclusions and waiting periods in a policy with reasonable restrictions. Mr. Byrd said a 30-day waiting period would be reasonable for both the insurer and the insured. Dr. Gail Golab (American Veterinary Medical Association—AVMA) said it is a complex issue because of the many different animals that could be covered under a policy, and certain conditions would manifest at different times for those different animals. She said a 30-day waiting period would be reasonable.

Mr. Gendron asked if there would be any concern with including a provision that with an inspection from a veterinarian, a waiting period could be waived. Dr. Golab said she would like to see specific language on that provision but agrees with the concept. Brendan Bridgeland (Center for Insurance Research—CIR) said he would not be in favor of the proposal to have no cap on waiting period durations. Birny Birnbaum (Center for Economic Justice—CEJ) said it is unclear why a waiting period is needed at all if there are preexisting condition exclusions in the policy. He said a waiting period would be problematic for consumers who would have an expectation when they purchased a policy that anything that is not a preexisting condition would be covered. Mr. Birnbaum said it is unrealistic to expect consumers to understand all the features and limitations of a product as complex as pet insurance. Cari Lee (North American Pet Health Insurance Association—NAPHIA) said the Working Group
will be presented with language that would be a middle ground in the discussion on waiting periods. She said waiting periods assist with the issue of adverse selection and allow all policyholders to be held to the same standards. Mr. Forte said he agrees with Mr. Gendron that waiting periods and pre-existing condition exclusions can be applied together with certain parameters. He said is comfortable with a 30-day waiting and that he would not be comfortable with the unlimited time frame.

Mr. Beatty said in Section 3G, there was a suggestion to change “treatment provided by a veterinarian” to “treatment provided, prescribed or suggested by a veterinarian.” There was no motion to adopt this change.

Mr. Beatty said in Section 4G (2), there was a suggestion to change “owner” to “insured.” Mr. Gendron asked if this change would bring a need to address insurable interest. Dr. Golab said it is not uncommon in the dog performance world to have a single animal with multiple owners, so there may be some advantage to referring to the insured instead of the owner. Mr. Byrd made a motion, seconded by Mr. Forte to adopt this change. The motion passed unanimously.

Mr. Beatty said the Working Group had previously discussed free look periods and that discussion is still an open topic. Mr. Birnbaum said there should be a provision that specifies that if a consumer is looking to return a policy, the insurer needs to provide clear instructions and the process should not be difficult for the consumer. Mr. Byrd said actuaries in Louisiana still take issue with providing insurance without a premium payment. Mr. Forte said actuaries in Washington also have an issue with this since there is a cost associated with administering the policy, and when consumers return the policy during the free look period, the cost is passed on to other consumers. Mr. McKenney said that since enough states take issue with the free look period, it should not be required, and it should be left to a state-by-state basis. He said the language says “not less than 30 days,” so technically the law is saying companies implement a 364-day free look. Mr. Birnbaum said the Travel Insurance Model Act (#632) incorporates a free look provision that should provide guidance for this model. He said the free look provision does not provide free coverage since the policy can only be returned if a claim has not been made. Mr. McKenney asked if the travel insurance free look period expires before the coverage takes effect. Caren Alvarado (Crum & Forster) said Model #632 states that if there is a free look period and if there is going to be a refund had there not been a claim paid, then the entire cost of the travel protection plan would be refunded.

3. Discussed Pet Wellness Products

Ms. Lee said NAPHIA submitted language for the Working Group’s consideration based on some of the concerns expressed over the last few meetings regarding wellness. She said NAPHIA members are licensed insurance entities, and none of the members sell stand-alone wellness products. She said currently, NAPHIA members are selling wellness products as endorsements to insurance policies, or they are sold alongside a policy as a separate product. Ms. Lee said NAPHIA’s proposed language clarifies that: 1) the purchase of wellness products is not a requirement to purchase pet insurance; 2) the cost of the wellness product should be separate and identifiable; 3) the terms and conditions should be separate from the policy and be available to the consumer prior to enrollment; 4) the wellness product should not duplicate the pet insurance policy benefits; and 5) the advertisement of wellness products should not be misleading. She said NAPHIA included language that specifies that advertisements should delineate between a wellness product and a pet insurance product, and that the wellness product should not use language that would apply to an insurance policy such as “premium” and “policy.” She said NAPHIA included language on disclosing the costs for the wellness product and which of the costs are for the pet insurance product.

Mr. Forte after reviewing the language, he believes it aligns with the view that wellness products should be distinct and different from insurance. He said if it is part of the policy, it would be considered insurance, and if it is separate from the policy, then it should have no influence on eligibility of the policy. He said the Working Group has heard reports that if a consumer does not pay a non-insurance company’s wellness plan, their insurance policy that is in partnership with the wellness company would then also be cancelled. He said there should not be a requirement to buy both the wellness product and insurance policy. Mr. McKenney said wellness products often include insurance benefits such as a death or burial benefit, or chiropractor benefits. He said the language about wellness products in the model should be carefully crafted so that companies are not issuing wellness products that do have insurance benefits but are not considered insurance products and, therefore, not regulated and not collecting premium tax.

Mr. Beatty suggested that the Working Group should draft language that states, “The wellness product can be a wellness product, but it cannot include anything that meets the definition of insurance under the specific state insurance code.” Mr. Birnbaum said the proposed language seems to be defining an insurance benefit as insurance if it is included in the policy and not an insurance benefit if it is a stand-alone product. He said this is confusing to consumers and an arbitrary distinction that promotes a lack of consistent regulation for consumer protection. Mr. Birnbaum suggested that wellness products should be defined as any product, service, or benefit related to promoting and maintaining the health and wellness of the pet. He said
these services—including wellness exams; blood tests; vaccinations; preventive medications for fleas, ticks, and heartworm; dental cleanings; spaying and neutering; and nail clippings—should all be a part of the insurance package. Mr. Bridgeland agreed with Mr. Birnbaum’s view of the wellness product offerings. He said he does not like the use of the word “complementary” in the NAPHIA language because it is too close to the word “complimentary” and could be confusing to consumers that might expect something that is being provided for free. Mr. Gendron said one issue with the language is that it seems to be attempting to give state insurance regulators authority over non-insurance products and may preempt the authority of state attorneys general with regard to unfair trade practices. Allison Osterberg (Banfield Pet Hospital—Banfield) said Banfield does sell wellness plans that are not insurance. She said it is a bundle of set services offered by their veterinarians, and the product does not need a triggering event to be used. She said it is common in the veterinary industry to sell prepackaged services for specific clinics or pet hospitals. The Working Group agreed to continue discussion of wellness products in their next meeting.

Having no further business, the Pet Insurance (C) Working Group adjourned.
The Pet Insurance (C) Working Group of the Property and Casualty Insurance (C) Committee met June 10, 2021. The following Working Group members participated: Don Beatty, Chair (VA); Kendra Zoller, Vice Chair, Andrew Gulcher and Risa Salat-Kolm (CA); Katie Hegland (AK); Jimmy Harris (AR); Kristin Fabian and George Bradner (CT); Angela King (DC); Tom Travis and Warren Byrd (LA); Rasheda Chairs and Shirley Corbin (MD); Erin Summers (NV); Michael McKenney (PA); Matt Gendron (RI); Kathy Stajduhar (UT); Anna Van Fleet (VT); and David Forte and Eric Slavich (WA). Also participating were: Brenda Johnson and Sharil Sivertson (KS); Brock Bubar (ME); Chris Aufenthie (ND); Tracy Burns (NE); Maggie Dell (SD); and Jody Ullman (WI).

1. Adopted its May 19 Minutes

The Working Group met May 19 and took the following action: 1) discussed Section 3, Section 4 and Section 7 of the draft Pet Insurance Model Act; and 2) discussed issues with standalone and endorsement wellness products.

Mr. Forte made a motion, seconded by Mr. Bradner, to adopt the Working Group’s May 19 minutes (Attachment Four-A1a1a1). The motion passed unanimously.

2. Discussed Section 3, Section 4 and Section 7 of the Draft Pet Insurance Model Act

Mr. Beatty said the Working Group would discuss comments received on the remaining open issues in the draft model. Ms. Zoller said California submitted a new proposed definition for “pet insurance” because the Working Group had not come to an agreement on the language about veterinary expenses within the definition. She said the definition reflects how pet insurers are currently defining the product and what the product is currently offering. The language reads, “‘Pet Insurance’ means an individual or group property insurance policy that provides coverage for accidents and illnesses of pets.” Ms. Van Fleet said Vermont approves of the proposed definition. Mr. Forte said the Working Group had previously discussed removing the reference to group policies, as the industry had reported that the policies are not true group policies. He said group policies are not offered on property/casualty (P/C) insurance products. He recommended that the definition not refer to individual or group polices. Ms. Zoller agreed to this change in the proposed definition. Birny Birnbaum (Center for Economic Justice—CEJ) said preventative care should be part of the definition. Brendan Bridgeland (Center for Insurance Research—CIR) said including the word “property” in the definition would be a complication if pet insurance is in the future designated as a different type of insurance. Ms. Zoller said the addition of “property” would help consumers understand what type of insurance they are buying. Cari Lee (North American Pet Health Insurance Association—NAPHIA) said the term “veterinary expenses” is still misleading to consumers. Mr. Forte said the use of the term “eligible expenses” would be confusing, as that term is used in health insurance, but property insurance would use the term “covered expenses.”

Mr. Forte made a motion, seconded by Ms. Van Fleet, to adopt a definition that states, “‘Pet Insurance’ means a property insurance policy that provides coverage for accidents and illnesses of pets.” The motion passed unanimously.

Justin Liby (Companion Protect) said the use of the term “coverage is afforded” is concerning because if a claim is paid but the condition should have been excluded, the current language would require the insurer to continue covering that condition, and they would not be able to apply a preexisting condition clause to that condition. He said the language should be replaced with “a claim was properly paid” in the definitions for “preexisting condition” and “waiting period.” Mr. Birnbaum and Mr. Bridgeland opposed this change. Mr. McKenney said it should not be based on whether a claim was paid because a company can open an investigation into the claim during the policy period and pay it after the policy period ends. He said it should be based on whether coverage applies to the condition. No motion was made to adopt this change.

Mr. Liby said Section 3I—Renewals should be removed from the draft model because the existing insurance codes and regulations already define what a renewal is, and the draft model definition could conflict with those existing definitions. Mr. McKenney said the purpose of this definition is to not allow a company to call a policy a renewal if it is going to exclude coverages that were included in the initial policy period. He said if the industry is going to exclude conditions in subsequent policy years, then it would have to issue a non-renewal and offer the customer a new policy with altered terms. Mr. Gendron said the conflicts of law doctrine would apply, as this definition would be more specific and more recent than the existing definitions. Mr. Bridgeland agreed that Section 3I should remain in the draft model. No motion was made to adopt this change.
Mr. Liby said in Section 4, the information in Subsection B is dealt with in Subsection C and Subsection D; therefore, Subsection B should be deleted. He said in Subsection D, the term “usual and customary” should be replaced with “prevailing veterinary service provider charges” because it captures the intent of the overall disclosure. Mr. Birnbaum opposed removing “usually and customary” because the proposed alternative inserts the words “veterinary service,” which could be a contradiction to the issues with the term “veterinary expenses” in Section 3—Definitions. Mr. Bridgeland opposed the removal of Subsection B because consumers should know how the insurers determine that payments are going to be made. No motion was made to adopt these changes.

Ms. Zoller said in several areas of Section 3 and Section 4, she suggested that requirements in the draft model to link to definitions and disclosures should also be required to be prominently displayed and in at least 12-point font size. Mr. Beatty said it makes sense for the information to be prominently displayed, but it is not clear what font size would be appropriate for a website. Mr. Birnbaum said the font size would vary depending on the tool being used to view the website. Mr. Gendron said the Federal Trade Commission (FTC) uses the term “clear and conspicuous.” Mr. Bridgeland suggested requiring that the links cannot be in a smaller font size than the rest of the website. Ms. Lee said NAPHLA agrees to the “clear and conspicuous” language. Mr. Gendron made a motion, seconded by Mr. McKenney, to use the term “clear and conspicuous link” in Section 3 and Section 4 of the draft model when talking about required links on insurers’ and insurers’ program administrators’ web pages. The motion passed unanimously.

Ms. Zoller proposed a change to Section 4(A)2 that requires a disclosure if the policy excludes certain preventative care and wellness services. Mr. Beatty suggested revisiting this suggestion after the Working Group has concluded its discussion on wellness products.

Ms. Zoller said there had been previous discussion on the marketing of pet insurance products, and she proposed a new disclosure stating, “an insurer shall not market or advertise pet insurance as health insurance for pets.” Mr. Forte said he understands the purpose of the proposal because many of the claims in Washington stem from confusion on the type of insurance the consumer is purchasing. He said if a new disclosure is adopted, he would like it to include clarifying language that pet insurance is property insurance. Mr. McKenney suggested that this language should be placed elsewhere in the law and should not be a required disclosure. Mr. Bridgeland agreed that the language should be a part of the law, but it does not need to be a separate disclosure. Ms. Lee said NAPHLA would support keeping the health language, as that is the way consumers tend to view pet insurance. Ms. Dell said using the health language could cause problems on the regulation side for enforcement of misrepresentation. Lisa Brown (America Property Casualty Insurance Association—APCIA) suggested that a potential disclosure should state that while the product covers some health concerns, it is a property insurance policy. Mr. Birnbaum said the purpose of the draft model is to get clear definitions and ensure that consumers know what they are purchasing, and it should not be used to memorialize what insurers are currently doing in the marketplace. He said he would support including the language proposed by California. Mr. McKenney asked if the states are getting complaints about the way the products are advertised. Ms. Zoller said the California complaints are not coded with that level of detail, but the complaints usually center around consumers not knowing exactly what they are purchasing.

Mr. Liby said Companion Protect would oppose the free look period that is mandated in Section 4 because the free look period tends to drive bad customer behavior. He said the free look period encourages consumers to buy a pet insurance product that they would not normally buy because they consider it a no regret decision, and they can cancel in 30 days if they do not have a claim. He said requiring a free look period leads to higher acquisition costs that insurers will never recover, and it leads to a higher volume of early terminations. He said Companion Protect proposes a required pro-rated premium refund if the policy is cancelled in the first 30 days. Mr. Gendron said free look periods are used in other lines with complex products, such as life insurance, annuities and travel insurance. He said he would like Companion Protect to submit data that supports its position. Mr. McKenney agreed with Companion Protect’s position that the free look period is not actuarially sound and passes on costs to all customers. Ms. Lee said NAPHLA would disagree with Companion Protect on this issue because the free look period is consumer friendly and allows the consumer to look at their policy in more detail and cancel that policy if it is not what the consumer thought it was. She said NAPHLA has not found that the free look period increases the cost of pet insurance in a significant way. Mr. Bridgeland said if the industry can include waiting periods in the policy, then the consumer should be allowed to have a free look period. Mr. Forte asked if NAPHLA could share its data on the minimal cost of free look periods. Ms. Lee said NAPHLA would share that data with the Working Group.

Having no further business, the Pet Insurance (C) Working Group adjourned.
The Pet Insurance (C) Working Group of the Property and Casualty Insurance (C) Committee met May 19, 2021. The following Working Group members participated: Don Beatty, Chair, Jessica Baggarley and Phyllis Oates (VA); Kendra Zoller, Vice Chair, and Andrew Gulcher (CA); Katie Hegland (AK); Kristin Fabian (CT); Angela King (DC); Warren Byrd (LA); Sheri Cullen (MA); Rasheda Chairs and Shirley Corbin (MD); LeAnn Cox (MN); Erin Summers (NV); Michael McKenney (PA); Matt Gendron (RI); Kathy Stajduhar (UT); Jamie Gile (VT); and John Haworth and Eric Slavich (WA). Also participating were: Linda Grant (IN); Brenda Johnson and Sharil Sivertson (KS); Sandra Darby, Brock Bubar and Frank Niles (ME); Chris Aufenthie (ND); Tracy Burns (NE); Maggie Dell (SD); and Jody Ullman (WI).

1. **Adopted its April 29 Minutes**

The Working Group met April 29 and took the following action: 1) discussed Section 3, Section 4 and Section 7 of the draft Pet Insurance Model Act; and 2) discussed issues with classifying pet insurance as a property/casualty (P/C) product.

Mr. Gendron made a motion, seconded by Mr. McKenney, to adopt the Working Group’s April 29 minutes (Attachment Four-A1a1a1a1). The motion passed unanimously.

2. **Discussed Section 3, Section 4 and Section 7 of the Draft Pet Insurance Model Act**

Mr. Beatty said the Working Group received comments from Companion Protect (Companion) regarding Section 3, Section 4 and Section 7 of the draft Pet Insurance Model Act. Justin Liby (Companion) said Companion would like to see some flexibility in terms of whether definitions in the draft model will be prescriptive required terms. He said Companion would like state insurance regulators to be able to approve the use of similar definitions. Birny Birnbaum (Center for Economic Justice—CEJ) said this approach would not provide the consistency sought in the draft model and would allow for different definitions in each state. He said for consumer protection purposes, he would like to see important terms defined in the draft model. Brendan Bridgeland (Center for Insurance Research—CIR) said it is important to have a common baseline to avoid consumer confusion.

Mr. McKenney said this proposed language would allow for non-uniformity, both across different states and within the state, because different language could be approved for individual insurers within the state. The Working Group did not vote to adopt this change.

Mr. Liby said Companion does not want to have to link to the definitions and disclosures on the main page of the insurance company website, as required in Section 3 of the draft model. He said there may not even be a reference to pet insurance on the main page of the website, and there are several pet insurance programs that have program administrators who maintain the website and market the products. He said Companion’s suggestion is to require the location of the link to the definitions to be within the marketing information for the applicable policy. He said many pet insurers offer more than one type of policy, and there may be some differences with respect to the required disclosures, so companies have different policies. Additionally, he said some program administrators may administer multiple policies for a single insurer, or they may work with multiple insurers. Mr. McKenney asked how this language would be applied to printed marketing materials, such as pamphlets in pet stores and veterinary offices. Mr. Liby said the intention of the language is limited to internet website presence. Mr. McKenney said the language as submitted is not clear in its reference to marketing material. Mr. Gendron said the current language does not require the links on the insurer’s main page if a program administrator’s web page is used. He said the purpose of the language is to make the information easily available to consumers. Ms. Zoller said Companion currently has a link for California customers on their main web page. Mr. Liby said that if Companion were to market a product for a different company, it would not want to place the link on the main web page. Ms. Zoller said the link is already buried on the web page, and the draft model should require the link to be more prominent. Mr. Byrd agreed that the link should be prominent on the main web page. Mr. Bridgeland said he would not be in favor of the proposed change. He said some companies currently have the information available on their web page, but there is no link, and the information can only be accessed through a Google search. Lisa Brown (American Property Casualty Insurance Association—APCIA) said even if program administrators do not have links, they should still be able to link to definitions on the main page of their website. The Working Group did not vote to adopt the change.

Mr. Liby said Companion would support the new definition of “pet insurance,” as proposed by the North American Pet Health Insurance Association (NAPHIA) and the American Veterinary Medical Association (AVMA). That language reads, “Pet
Insurance’ means an individual or group insurance policy that provides coverage for expenses specified in the policy.” Ms. Zoller said the current definition that refers to veterinary expenses is not limiting the services that are covered. Kate Jensen (NAPHIA) said the proposed definition makes it clear that the definition of “pet insurance” is what is laid out in the specific policy that is purchased. She said this will encourage the consumer to understand what they have purchased and what is covered in the policy. Isham Jones (AVMA) said it is important that the consumer knows when going into a veterinary clinic what will and will not be covered under their pet insurance policy. Ms. Oates suggested the use of the term “eligible veterinary expenses.”

Mr. McKenney said it would make sense to use “eligible veterinary expenses” and keep the definition of veterinary expenses. Ms. Brown said the APCIA would support the proposed definition of “pet insurance” from NAPHIA and the AVMA. She said if the Working Group adopts the use of eligible veterinary expenses, then there should be an added clause of “as specified in the policy.” Ms. Jensen said by limiting the definition to veterinary expenses, no matter how it is defined, companies would be limited in what they could offer consumers in terms of coverage in the future. She said NAPHIA would like to see flexibility with this definition. Mr. Birnbaum said the proposed definition from NAPHIA and the AVMA does not make it clear that it is for pet insurance. Ms. Jensen said the definition is broad because there is no standard policy in pet insurance, and industry does not want the definition to be limiting. She said the definition could be reworked to include the word “pet.” Ms. Brown said there are companies that are currently offering coverage for services outside of veterinary offices, and companies should be able to continue to write those policies or policies for other products that consumers may request in the future. Mr. Gendron said there may be an unintended consequence of trying to define what “pet insurance” is if the intent is to exclude wellness coverage offered by veterinarians as insurance. He said the discussion on wellness products would help inform the discussion on the definition of “pet insurance.”

3. Discussed Issues Related to Pet Wellness Products

Ms. Zoller said the Working Group should consider addressing, within the draft model, the wellness plans that most pet insurers are now selling alongside their insurance policies. Mr. Gulcher said California has seen several add-on products to traditional insurance, such as wellness products and health savings accounts (HSAs), that have been confusing to consumers. Ms. Zoller said with some of these products, the consumers pay money and then lose that money if they do not use the benefits. Mr. Gulcher said there are regulatory questions of how the money is being handled by the insurance companies and the verbiage used to describe wellness products and HSAs. Mr. Beatty asked if these products met the definition of “pet insurance” in California. Mr. Gulcher said the definition is broad because there is no standard policy in pet insurance, and industry does not want the definition to be limiting. Ms. Oates said the definition could be reworked to include the word “pet.” Mr. Brown said there are companies that are currently offering coverage for services outside of veterinary offices, and companies should be able to continue to write those policies or policies for other products that consumers may request in the future. Mr. Gendron said there may be an unintended consequence of trying to define what “pet insurance” is if the intent is to exclude wellness coverage offered by veterinarians as insurance. He said the discussion on wellness products would help inform the discussion on the definition of “pet insurance.”

He said the discussion on wellness products would help inform the discussion on the definition of “pet insurance.”

Having no further business, the Pet Insurance (C) Working Group adjourned.
The Pet Insurance (C) Working Group of the Property and Casualty Insurance (C) Committee met April 29, 2021. The following Working Group members participated: Don Beatty, Chair, (VA); Kendra Zoller, Vice Chair, and Risa Salat-Kolm (CA); Katie Hegland (AK); Kristin Fabian and George Bradner (CT); Angela King (DC); Warren Byrd (LA); Rasheda Chairs and Shirley Corbin (MD); LeAnn Cox and Kendra Hetland (MO); Erin Summers (NV); Michael McKenney (PA); Matt Gendron (RI); Kathy Stajduhar (UT); Jamie Gile and Anna Van Fleet (VT); and David Forte, John Haworth and Eric Slavich (WA). Also participating were: Ken Williamson (AL); Brenda Johnson (KS); Sandra Darby, Lindsay Laxon and Frank Niles (ME); Chris Aufenthie (ND); Tracy Burns (NE); Maggie Dell (SD); and Jody Ullman (WI).

1. **Discussed Section 3, Section 4 and Section 7 of the Draft Pet Insurance Model Act**

Mr. Beatty said after the Working Group’s previous meeting on March 26, the North American Pet Health Insurance Association (NAPHIA) submitted comments that addressed language regarding renewals that had been adopted by the Working Group. Kate Jensen (NAPHIA) said NAPHIA members are concerned that the adopted language would limit the ability of consumers to choose a term-limited accident and illness policy for their pet. She said NAPHIA is concerned it will limit innovation and options for consumers to have products at a lower price point. She said NAPHIA prefers robust disclosures to consumers about policy renewals and how the policy works. Mr. McKenney said the language adopted into the model says if a succeeded policy excludes conditions that were covered in the previous policy, then it cannot be called a renewal. He said the NAPHIA letter indicated that there have not been complaints about limited term policies not covering pre-existing conditions in subsequent policies, but the industry has stated those policies are not yet available in the U.S.; therefore, there would be no complaint data. Mr. Byrd asked Ms. Jensen if the price point of the products that the industry offers will be determined by the experience of claims on these products. Ms. Jensen said there is a large gap in the price points of a policy that offers a lot of coverage and an accident-only policy. She said the industry does not want to lose the opportunity to innovate products that would be middle ground in terms of coverage and premium price.

Mr. Forte said he is concerned that a disclosure would not be sufficient to inform a consumer that conditions covered in the current policy period are likely to not be covered on the next policy with limited term policies. Mr. Bradner said the companies would have to issue non-renewals to the consumer and re-issue a policy with different terms and conditions. Mr. Forte said the consumer should know before purchasing a limited term policy that any subsequent policies will have different terms and conditions. Ms. Jensen said that any disclosure for this type of product would state very clearly that the policy is only for a limited term and that subsequent policies will have new pre-existing condition clauses and new waiting periods.

Brendan Bridgeland (Center for Insurance Research—CIR) said offering waiting periods for one-year limited-term policies could lead to confusion for consumers and companies. He said the Working Group should consider using a term other than “pre-existing condition” to avoid confusion for consumers that would be familiar with the concept in human health insurance. The language in Section 3—Definitions related to renewals remained unchanged.

Mr. Beatty said Mr. Bridgeland had submitted a drafting note related to Section 3E—Preexisting Condition. Mr. Bridgeland said the drafting note is to be used to provide guidance on what a verifiable source is. He said the drafting note would make clear that verifiable sources include business records from veterinarians, shelters, police and animal control, prior insurance claims, and any other written or electronic records. He said social media posts, especially those that include undated images, do are not necessarily indicate verifiable sources but could be used by companies investigating potential fraud. Ms. Jensen said NAPHIA does not believe a drafting note is necessary since the term “verifiable sources” means able to be checked for accuracy. She said if the Working Group feels a drafting note is necessary, the proposed language from NAPHIA clarifies that an insurer’s record would be a verifiable source.

Mr. Beatty said NAPHIA submitted additional comments on Section 7B and time limits on waiting periods. Ms. Jensen said NAPHIA strongly opposes any time limit on waiting periods and any language that would preclude the use of waiting periods and pre-existing condition clauses together. She said they oppose anything that would require companies to parse out premium for each waiting period. Ms. Jensen said NAPHIA included language that adds more detail to the waiting period disclosure. Mr. Byrd asked what time frame NAPHIA would suggest for the length of a waiting period. Ms. Jensen said the length of
waiting period varies by policy and carrier, and it also affects the premium price point. She said waiting periods are typically structured for different conditions based on how long those conditions would take to develop. She said NAPHIA does not have consumer complaint records relating to waiting periods because there is robust disclosure of these waiting periods to the consumers.

Mr. McKenney said the Working Group should look at reworking the language in Section 7B that states no premium will be charged during the waiting period. He said that at least some premium should be charged if only certain conditions are excluded during the waiting period.

Mr. Beatty said the Working Group had previously discussed removing “individual or group” from Section 3D—Pet Insurance. He asked if any Working Group member is opposed to this removal. No Working Group member was opposed.

Mr. Beatty said the Working Group had previously discussed changing Section 3G—Veterinary Expenses to Eligible Expenses. Mr. Gendron said he understands the idea behind changing the term to “eligible expenses,” but he said he is concerned about the unintended consequences of broadening the definition. Mr. Byrd suggested that the language could be changed to indicate that veterinary expenses means eligible expenses. Ms. Jensen said most consumers do think of pet insurance as covering anything that happens at the veterinarian, but that is not always the case.

Mr. Forte said Washington has requested adding a disclosure that premium may increase due to the age of the pet and where the consumer resides. He said those premium increases are the biggest complaint they get in Washington. He said he is hopeful an additional disclosure would clear up confusion for the consumers. Mr. Byrd agreed that this is an important issue. Mr. McKenney said he has seen very large rate increases from products where the premium does not increase as the pet ages. He said the insurers had failed to account for the increased risk as the pet ages and, therefore, had to drastically increase premium rates. Gavin Friedman (Trupanion) said consumers should know factors that may cause their premium to increase, as well as factors that will cause their premium to increase. Mr. Bradner said he is not concerned about this issue because policies such as homeowners insurance increase in premium price as the home ages. Mr. Forte said the complaint is due to the amount of increase in premium. Mr. Beatty said if there is no opposition, the additional disclosure will be left in the draft model.

Mr. Beatty said the Working Group had previously voted to remove the Licensing section of the draft model and replace it with a drafting note. Mr. Gendron said the Producer Licensing Uniformity (D) Working Group is currently looking at how to handle producer licensing of pet insurance. He said once that Working Group makes a decision on how the licensing is handled, a drafting note in this model would no longer make sense. Mr. Beatty agreed and said the drafting note would be removed from the model.

2. Discussed Issues Related to Pet Insurance as a P/C Product

Mr. Gendron said the Rhode Island Department of Business Regulation – Insurance Division has been looking into whether it makes sense to report pet insurance as an inland marine line of business. He said pet insurance does not look like other risks reported in the inland marine line or in property/casualty (P/C) insurance. He said pet insurance evolved from horse insurance, and while it makes sense to classify horses as property when they have a monetary value, it does not necessarily make sense for a household pet. He said the terms used in pet insurance are similar to human health insurance, it is marked like health insurance, and actually it operates like health insurance. Mr. Beatty said reclassifying pet insurance as health insurance would be difficult in the real world due to prior approval rates and other issues affecting both the insurance industry and state legislators. Mr. Byrd said he understands Mr. Gendron’s position, but he believes health insurance is for humans and pet insurance should continue to be classified as a P/C line of business. Ms. Zoller said another option is to have insurers stop marketing pet insurance as health insurance. Mr. Williamson agreed with Mr. Gendron and said he does not understand writing a health coverage on a property risk. Mr. McKenney said he agrees with both points, but it may be too late to try to reclassify pet insurance since there are adjudications dealing with pet insurance in the P/C market. He said if pet insurance is reclassified as health insurance, the industry would have to support that change.

Having no further business, the Pet Insurance (C) Working Group adjourned.
The Transparency and Readability of Consumer Information (C) Working Group of the Property and Casualty Insurance (C) Committee met July 20, 2021. The following Working Group members participated: Joy Hatchette, Chair (MD); Jimmy Gunn and Stephanie Tompkins (AL); Bobbie Baca (CO); George Bradner and Connor Huydic (CT); Julie Rachford (IL); Heather Droge (KS); Ron Henderson (LA); Jeana Thomas (MO); Kathy Shortt (NC); Chris Aufenthie and Janelle Middlestead (ND); Cuc Nguyen (OK); Jennifer Ramcharan (TN); and Marianne Baker and Laura Machado (TX). Also participating were: Michele McKenzie (ID); Linda Grant (IN); Karen Dennis (MI); Trisha Goldsmith (OR); Candy Holbrook (SD); Vicki Ayers (VA); Manabu Mizushima (WA); and Donna Stewart (WY).

1. Adopted its May 13 and Spring National Meeting minutes

The Working Group met May 13 and March 15. During its May 13 meeting, the Working Group took the following action: 1) heard reports from the three drafting groups formed to draft the various sections of a consumer disclosure regarding significant premium increases on property/casualty (P/C) insurance products; and 2) heard a presentation about VisibleThread’s language analysis platform.

Ms. Shortt made a motion, seconded by Ms. Droge, to adopt the Working Group’s May 13 (Attachment Five-A) and March 15 minutes (see NAIC Proceedings – Spring 2021, Property and Casualty Insurance (C) Committee, Attachment Four). The motion passed.

2. Received an Update from the Thresholds and Communications Standards Drafting Group

Mr. Bradner said the Thresholds and Communications Standards Drafting Group determined the following items regarding requirements for disclosures for premium increases: 1) a 10% threshold (any rate change greater than or equal to 10% on renewal) will trigger a notice; 2) the notice must be sent at least 30 days prior to the renewal; 3) the notice must include the new premium versus the old premium; 4) items affecting the premium increase should be listed by dollar amount; 5) the top reasons should be listed and should account for 80% of the premium increase, and the top five reasons for the premium increase should be listed; and 6) if an insurer already has an acceptable notification process in place and the state is in agreement with the process, the insurer could be allowed to continue the process in place; otherwise, these will be the minimum requirements.

Charles Angell (AL—Retired) said in the disclosure notice (Attachment Five-B), the second and third paragraphs apply only to policies that were capped. If an insured’s premium was not capped, these paragraphs would be deleted and replaced by a single sentence stating the renewal premium. He said the reasons for the premium increase would be listed in descending order with the largest impact being shown first and then at least 80% of the premium increase; this is for the uncapped premium.

Various suggestions were made regarding the last sentence, and the Working Group agreed upon: “Please call your agent or our Customer Service Representative at (xxx) xxx-xxxx with any questions.”

Birny Birnbaum (Center for Economic Justice—CEJ) suggested that there should be a mechanism in place to test the disclosure to see if it is effective for consumers. Ms. Hatchette said she does not know if the NAIC had a mechanism in place to do consumer testing. She said NAIC staff will follow up to see if there are any mechanisms in place to test this disclosure with consumers. Mr. Birnbaum suggested giving reasons that insureds might offer for premium increases, or at least provide some examples. Mr. Bradner said the Drafting Group would discuss this possibility.

Mr. Angell said a disclosure notice must include specific reasons for the premium increase, which will vary from insurer to insurer. He said he is not sure the NAIC would be able to do consumer testing. He asked if anyone had other ideas on how to do the testing. Mr. Bradner said that maybe the insurers could do a sampling of letters that would send and then these letters could be used to do surveys with the individuals that received the letters on their renewals.

Angela Nelson (Automobile Club of Missouri) said when consumer testing was done on the health side, a consumer information subgroup tested the summaries of benefits and coverage forms, which does have a lot of information and variability by plan. She said when thinking about the different cost sharing, there were enough common elements to where they could go forward with some clarifications that the Consumer Information (B) Subgroup filled in for the consumer to test.
Ms. Hatchette suggested that perhaps Lisa Brown (American Property Casualty Insurance Association—APCIA) would be able to get the NAIC some samples of reasons for premium increases so the NAIC would be able to simulate what a notice might look like to do some consumer testing. Ms. Brown said until these disclosures are required, it might be difficult to get responses from the insurers. Mr. Bradner agreed that this is only something that could work once a state tells an insurer this is wanted.

3. Received an Update from the Rate Checklist Drafting Group

Ms. Droge said many states do not currently have a rate checklist in place. She said Kansas and Connecticut both have rate checklists in place, and both states find them to be extremely helpful. Ms. Droge said the Rate Checklist Drafting Group believes that although this checklist should not be required, it should be included in the best practices document, as states that do not have something like this in place may find the checklist to be beneficial.

Ms. Droge said Kansas has been using its checklist for about nine years and has found it to be efficient, as the checklist has increased its productivity by reducing the number objections they send out to the insurers. She said the checklist includes items that Kansas thought were most important. Ms. Droge said the checklist has reduced the amount of correspondence going back and forth between insurers and the Kansas state insurance regulators.

Ms. Droge said the Drafting Group made the decision to recommend using the Kansas rate/rule filing checklist. She said the Drafting Group did decide to add a question about whether an insurer is using a rating model. Ms. Droge said the Drafting Group believes that there are times insurers are using rate models and do not include this fact in their rate filings. She said the Drafting Group thinks the additional questions regarding rate models will provide a little more feedback to the state.

Ms. Droge said the document will be distributed to the Working Group members and interested parties following this meeting.

4. Received an Update from the Consumer Education Drafting Group

Ms. Shortt said the Consumer Education Drafting Group began with a master document from which it could pull various pieces of consumer education pieces. She said the Drafting Group has broken into three smaller drafting groups to draft the topics of underwriting and rating, and factors affecting premium increases and discounts.

Ms. Shortt said the Drafting Group is currently working on automobile insurance and will work on consumer education regarding homeowners insurance once the automobile insurance piece is completed. She said each of these drafting groups has been meeting consistently and will continue meeting on a monthly basis until the work is completed.

Ms. Shortt said the Underwriting and Rating Drafting Group has completed its work, and it will be sent to Brenda J. Cude (University of Georgia) for a readability review. Ms. Shortt said once all of the work is completed and documents are in place for auto and homeowners insurance, the NAIC Communications department has agreed to put together some infographics, social media pieces, and consumer alerts to be used by the departments of insurance (DOIs).

5. Heard a Presentation Showing an Example of Before and After the Use of the VisibleThread Product

Sara Robben (NAIC) showed the Working Group an example of the product output from the VisibleThread product. The product produces a report in both Microsoft Excel and Microsoft Word that shows the number of long sentences that were used, the readability and grade level score for each sentence, and the number of passive voice sentences that are in the document. The product also provides suggestions of how to fix sentences to make them more readable.

Ms. Robben asked Working Group members to let her know if they would like contact from VisibleThread regarding the use of this product. Ms. Baker talked with VisibleThread, and she said the product seemed to be interesting. She said the VisibleThread contact indicated that they were interested in working with insurance companies, which was interesting to her. Ms. Baker said they asked her about policy forms, and she directed them to the System for Electronic Rate and Form Filing (SERFF) to look at various policy forms. She said she believes working with insurance companies on policy forms would have a huge impact.

Having no further business, the Transparency and Readability of Consumer Information (C) Working Group adjourned.
The Transparency and Readability of Consumer Information (C) Working Group of the Property and Casualty Insurance (C) Committee met May 13, 2021. The following Working Group members participated: Joy Hatchette, Chair (MD); Ken Allen (CA); Bobbie Baca (CO); George Bradner (CT); Brenda Johnson (KS); Ron Henderson (LA); Jeana Thomas (MO); Chris Aufenthie (ND); David Combs (TN); and Marianne Baker (TX). Also participating were: Renee Campbell (MI); Jana Jarrett (OH); and Bill Cole, Kristi Alma Jose and Donna Stewart (WY).

1. Heard a Presentation from VisibleThread

John Noland (VisibleThread) said insurers are endeavoring to use the plain language guidelines put into place by the various states. Insurers do not necessarily use the same vocabulary as their audience, as it is difficult for the human brain to forget what has already been learned regarding vocabulary. Mr. Noland said independently objective scoring of written content can be useful and instructive. He said this concept has been around for many years, and most people are familiar with Flesch-Kincaid readability scores and grade levels, which are available in Microsoft Word. However, multiple people throughout organizations do not consistently use these tools, as they are not easy for everyone to use.

Mr. Noland said VisibleThread makes it easy for people to see that there is a problem with content. He offered state insurance regulators the ability to use VisibleThread’s product to test a particular insurer’s content to learn more about the product. He said most communications distributed by insurers are not readable to the consumer. VisibleThread allows the content to be reviewed, audited and written in an understandable way.

Mr. Noland said an insurer’s legal and contracts office have to be shown some objective data that demonstrates that a policy is not readable. He said when a subject matter expert (SME) is shown that there is a challenge for the reader and an area needs attention, they are positive and supportive of change. He said it is important for the consumer to understand what they are reading.

Mr. Noland said VisibleThread allows documents, web pages and text to be analyzed. He said plain language supports compliance. Sentences should be kept relatively short, having no more than 20 words per sentence. Mr. Noland said it is important to write as simply as you can and keep to the grade level the state requires, which is either grade level five, six or seven. He said it is also important to not use passive voice or reduce it to below 5%.

Mr. Noland said VisibleThread allows documents, web pages and text to be analyzed. He said plain language supports compliance. Sentences should be kept relatively short, having no more than 20 words per sentence. Mr. Noland said it is important to write as simply as you can and keep to the grade level the state requires, which is either grade level five, six or seven. He said it is also important to not use passive voice or reduce it to below 5%.

Mr. Noland said the VisibleThread product provides a score card. A document can be emailed and run through the program, and the guidelines can be sent back to the party sending the document. The program needs can be configured based upon audience type. Mr. Noland said VisibleThread would provide state insurance regulators with a link to where they can email documents to receive a score card.

Mr. Noland said VisibleThread can use the style guide of a particular company or the guidelines. The product has watch words, which are words that should be used in documents. VisibleThread provides guidance on best practices; these best practices will differ for organizations and states.

Rowland Bradley (VisibleThread) said each state has its own readability guidelines. Important paragraphs within an insurance policy do not meet readability guidelines. Ms. Hatchette said state insurance regulators constantly struggle with trying to ensure that complicated insurance terms are written in a manner that the average consumer can understand. Mr. Noland said the use of the VisibleThread program makes it easy to write things in plain language, and it is free for the state insurance regulators to try. VisibleThread allows the writer to use the system to more quickly edit and change documents. Mr. Noland said this product works for Spanish as well as English.

Mr. Noland said there are five basic steps to a better customer experience and a return on investment. The steps include: 1) identifying a champion; 2) creating a baseline with a content audit; 3) making the style guide and terminology list accessible; 4) supporting writers to score content for quality; and 5) measuring and improving. Mr. Noland invited state insurance regulators to reach out to VisibleThread if they want to subjectively look at things a department of insurance (DOI) is writing. Peter Kochenburger (University of Connecticut School of Law) asked if there was any research as to whether a person would be more likely to understand their policy if it is written at a lower grade level. Mr. Noland said it is difficult to track whether
someone understands what they read because there are many factors in play, such as how stressed a person is when reading the policy. He said VisibleThread has been able to see successes with some insurers where they have done some great design work to either simplify the policy visually or break down some of the insurance jargon into subsets in the structure of the documents. Mr. Noland said the Center for Plain Language has some good examples. He said the complexity of the writing also comes into play in letters a consumer receives from the insurer or in the frequently asked questions (FAQ) insurers provide on the internet.

Mr. Bradley said people simply scan documents rather than read documents in today’s world, so a simpler design can help too.

2. Heard an Update from the Thresholds and Communications Standards Drafting Group

Mr. Bradner said the Thresholds and Communications Drafting Group has spent a couple of meetings discussing when a notice of premium increase should be sent to a policyholder. He said the drafting group is focusing on personal lines of business. Mr. Bradner said a 10% or greater change in premium upon renewal would trigger a notice being sent to the policyholder. He said the renewal should be sent at least 30 days prior to the renewal date, and the notice must include the new premium amount versus the old premium amount. He said the notice should list the items that affected the premium increase, and a dollar amount should be listed for each one of the items identified, so a policyholder can see the actual dollar impact that occurred for each item. He said the drafting group decided that 80% of the rate increase should be shown, and the top five reason most affecting the premium should be listed. He said if an insurer already has an acceptable notification process and the state agrees with the process, the state could allow the insurer to continue whatever process they had in place. He said if an insurer had no process in place, the items just discussed would be the minimum requirements a state DOI would expect. He said the next item the drafting group will discuss is rate capping.

Mr. Bradner said this will only apply to increases due to items such as an insurer changing a tiering band, or a youthful driver being added, accidents, etc.

3. Heard an Update from the Rate Checklist Drafting Group

Sara Robben (NAIC) said Kansas sends out a rate checklist to insurers that collects information from an insurer. Part of what is asked for on the rate checklist are items that will help the DOI explain rate changes to a consumer if the consumer happens to call the DOI. The form used by the Kansas DOI asks the insurer to provide talking points to explain the rate increase. Kansas also asks for histograms. Kansas rejects a filing if the insurer does not return the checklist with the filing.

Ms. Robben said Connecticut also has a couple of checklists the Rate Checklist Drafting Group is looking at. Mr. Bradner said Connecticut sends a detailed actuarial checklist to insurers. The questions on the checklist reflect the answers to questions the actuary wants to see when they are reviewing a filing. Mr. Bradner said the checklist was published in December 2020, and it is required on all personal lines filings. He said the checklist is used occasionally on commercial lines filings if there is a sizeable rate increase.

Mr. Bradner said the other checklists Connecticut uses are product oriented and more geared toward some of Connecticut’s statutes and regulations for a line of business that the examiner will be looking for.

Some of the states on the drafting group do not have rate checklists they use in their state, so if any of the states on this call have a rate checklist, the Working Group requests that a copy be sent to Heather Droge (KS). The drafting group is at a point to start writing up a checklist to be used in a best practices document.

4. Heard an Update from the Consumer Education Drafting Group

Ms. Robben said Kathy Shortt (NC) is the chair of the Consumer Education Drafting Group. She said Ms. Shortt initially created an outline of some of the various topics for the drafting group to consider for a consumer education document. She said the topics included everything from Ratemaking 101 to information about auto, homeowners and general terminology. The drafting group also discussed the types of information to include, and the drafting group discussed the various formats in which the information could be distributed. Ms. Robben said much of the information the drafting group wants to include in a consumer education document can be found in various other publications. NAIC staff has begun gathering information from various states, as well as from various insurers. The documentation collected includes information on how to deal with items such as credit, credit information, insurance scores, etc., as well as changes a consumer can make to mitigate insurance costs. Ms. Robben asked for Working Group members to send information they might have available to the drafting group.

Having no further business, the Transparency and Readability of Consumer Information (C) Working Group adjourned.
FINAL VERSION of DISCLOSURE NOTICE

Instructions to Insurers:

- Each insured receiving at least a 10% premium increase at renewal must receive a Disclosure Notice.
- This notice must be sent to the insured at least 30 days prior to the renewal date. It may be included with the renewal notice or may be sent in a separate mailing, or by email if the insured has elected to receive email notifications.
- The Disclosure Notice must include a listing of the rating factors/characteristics, and the dollar impact of each rating factor/characteristic on the premium increase, such that at least 80% of the uncapped premium increase is explained.
  - The rating factors should be listed in descending order of dollar impact.
  - Note that a “change in underwriting tier” is not acceptable as a rating factor to be listed. All rating factors/characteristics listed must be such that the insured can understand its content and determine if they have the ability to mitigate the increase caused by that rating factor. If multiple rating characteristics define the underwriting tier, then the premium increase caused by each of those rating characteristics must be considered separately.
- If an insurer already has a notification process acceptable to the State’s regulator, the insurer could be allowed to continue to use the process that is in place.
- The following Disclosure Notice is the minimum required notice. Insurers are permitted to provide additional information if so desired.

DISCLOSURE NOTICE

Your current premium is $1,175.

According to our current rating plan filed with your state, your renewal premium would be increased to $2,121. However, your renewal premium has been limited to $1,257 rather than charging the entire premium increase at this time. We are phasing in the remaining premium increases for your policy over the next X policy renewals.

Your future renewal premiums may also be increased or decreased by coverage changes you choose to make, by changes in your personal risk characteristics that occur during this time frame, and by future rate change filings made by our company with your state.

Here are the major reasons for this increase in your premium, along with the dollar impact of each of those reasons:
Reasons for your premium increase and the dollar impact

- Reason 1 raised your premium $A
- Reason 2 raised your premium $B
- Reason 3 raised your premium $C
- Reason 4 raised your premium $D
- Reason 5 raised your premium $E

Please call your agent or our Customer Service Representative at (xxx) xxx-xxxx with any questions.
How to Buy Title Insurance in [Insert State]

This guide:
• Covers the basics of title insurance.
• Explains the need for title insurance.
• Offers tips to shop for title insurance and closing services.
• Gives you questions you should ask before you buy title insurance.

DRAFT: 3-23-215-25-21
Introduction

A real estate transaction may be one of the largest investments you’ll ever make. Because the decisions you make when you buy or refinance a home can have effects for years to come, it’s important to take time to learn about the process so you can make good decisions.

You may want to hire a licensed professional to help you with the many steps to buy or refinance a home or piece of property. Before you agree to do business with anyone, however, be sure the individual is qualified and licensed.

Buying or Refinancing a Home or Property

So you’re ready to buy or refinance a home or piece of property. Now what?

If you’ve found the perfect home or property and the seller has accepted your offer, the next steps will most likely be:

- You’ll get a loan from a mortgage lender.
- A professional will inspect and appraise the home or property.
- You’ll choose an individual or business, known as a closing agent, to organize and finalize your real estate transaction.
- You’ll choose a “closing date” to sign paperwork and take ownership of your new home.
- You’ll buy homeowners insurance through a licensed property and casualty insurance agent.
- You’ll decide if you need flood and/or earthquake insurance, which you can buy through a licensed property and casualty agent.
- You’ll decide if you’ll need title insurance, which you can buy through a licensed title agent or company.
- A professional may “survey” the property. A survey is a professional drawing of the property’s boundaries. It also shows where a home is located on the property.
- You may be able to buy a home warranty that covers the mechanical breakdown of individual parts of a home, such as the electrical and plumbing systems. A warranty doesn’t cover the home’s structure, may or may not cover appliances, ends at a specific point in time (for example, one year) and has exclusions and limitations that you should review. Home warranties might not be regulated as insurance in your state.
- A final walk through of the home you’re buying will be scheduled.
- You’ll sign legal paperwork to finalize your new loan.

If you’re refinancing your home or property:

- You’ll get a new loan from a mortgage lender.
- A professional may inspect and appraise your home or property.
- You’ll give the lender information about your homeowners, flood and/or earthquake insurance coverage.
- You’ll decide if you need title insurance, which you can buy from a licensed title agent or company.
- A closing date will be selected.
- You’ll sign legal paperwork to finalize your new loan.

When you buy or refinance a home or piece of property, you’ll need to decide whether to buy title insurance.

What is title insurance? Why do you need it? This guide will answer those questions and more.
What is Title Insurance, and What Does it Cover?

A title documents your legal ownership or interest in property.

Title insurance is an insurance policy that covers past title problems that come up after you buy or refinance a property.

Lost, forged or incorrectly filed deeds, property access issues and liens on a property are just a few of the title problems that could come up after you buy or refinance a home or piece of land.

For example, if you received a letter telling you there’s an unpaid mortgage on the property you just bought, you could submit a claim to your title insurance company. The title insurance company would pay the legal costs to settle the dispute and/or to resolve the problem.

Without title insurance, you might have to pay all of the legal costs to settle the dispute. And if you lose the dispute, you could lose money, the equity you have in your home, and possibly ownership.

Two Types of Title Insurance—Owner’s and Lender’s Policies

There are two types of title insurance policies:

- An Owner’s Policy
- A Lender’s Policy

An owner’s policy protects you for the full price you paid for the home plus legal costs if a past title or ownership issue comes up after you buy your home. An owner’s policy is issued for the amount you paid to buy your home, and the policy will cover you as long as you own an interest in the property. You are not required to purchase an owner’s policy, but if you choose not to, you may lose the money you’ve paid for your home.

If a basic owner’s policy doesn’t cover a specific title issue, often you can add coverage, known as a policy endorsement. For example, if you’re buying a new home and the owner’s policy doesn’t cover claims (often known as a mechanic’s lien) filed by a contractor, you can add a policy endorsement to ensure you are covered. Some endorsements are free while others can be added for an additional fee.

An enhanced owner’s policy, which has a higher level of coverage than a standard owner’s policy, also may be available in your area. Enhanced owner’s policies cost about 20% more than a standard owner’s policy, but they cover extra risks. An enhanced owner’s policy also may continue to provide coverage after a property has been transferred.

If you borrow money to buy your home or property, your lender is likely to require you to buy a lender’s policy. A lender’s policy only protects the lender if a title or ownership problem comes up after the property is purchased. A lender’s policy is issued for the amount of the mortgage, and the coverage goes down as you pay down your loan. Unlike an owner’s policy, the lender’s policy ends when you pay off your mortgage. You may be expected to pay the premium for a lender’s policy.

Because a lender’s policy only protects the lender from title problems, you’ll also need an owner’s policy if you want to protect yourself.

What Doesn’t Title Insurance Cover?

Title insurance policies do not cover ownership issues that come about after you’ve bought a home.

For example, if your neighbor builds a fence on your property after you’ve bought your home, your title insurance policy will not cover the costs to settle the dispute.
Also, most title insurance policies don’t cover issues such as easements, boundary line disputes, zoning violations and air or mineral rights.

Your title insurance policy may spell out other issues that won’t be covered. And if there’s a title issue specific to the home you’re buying or refinancing, your title policy may not cover it. Ask for a list of what will and will not be covered, and be sure to read your policy.

Who Sells Title Insurance?

Only licensed title insurance companies, agencies and agents can sell title insurance in [INSERT STATE].

Drafting Note: If a state permits other individuals and entities to sell title insurance, this sentence should be amended to include those parties.

You can buy title insurance directly from a title insurance company or a title agent who sells title insurance for a company.

The Right to Choose Your Own Title Agent/Company

You have the right to shop for and choose your provider of title insurance and settlement services

A good time to shop for title insurance is when you choose a real estate agent, and a lender has prequalified you for a loan. You’ll have an idea of the price you can pay for a home/property and a title insurance agent or company can use that information to estimate your title insurance costs.

There are several ways you can find a title insurance agent or company:

- You can ask the sellers who they used when they bought the home.
- You can check the [INSERT NAME OF DOI] website, [INSERT WEB ADDRESS].
- You can check online for title insurance agents, agencies and companies in your area.
- You can ask for recommendations from your real estate agent, attorney, mortgage lender, financial institution or builder.

If your real estate agent, attorney, builder or lender offers to arrange title insurance for you, or suggests you use a specific title agent or company, ask if they have a business arrangement with the title company or agent they’re recommending and if they’ll make money from the referral. Federal law requires real estate professionals, title agents and lenders to tell you about any business arrangements they may have.

Also, beware of statements such as:

- “Everyone charges the same price.”
- “We’ll give you a discount on something else if you use our title agent.”
- “If you choose another title agent, your purchase may be delayed.”

These types of statements may be used to convince you to give up your right to choose a title agent or company, and you may pay more for title insurance than if you had shopped around.

Who Pays for Title Insurance?

If you’re buying a home, who pays for title insurance depends in part on local custom. It may be something, however, that you can negotiate with the seller of the property. When buying a home, be sure to ask your real estate agent what the custom is in your area and if you’ll likely be the one to pay for title insurance.
If you’re refinancing your home, it’ll be your responsibility to buy and pay for the title insurance policy.

A title insurance policy is paid for with a one-time premium payment.

What Does Title Insurance Cost?

The cost of title insurance is usually tied to the value of the home.

If you’re buying an owner’s policy, the price of your policy will depend on the home’s selling price.

The price of title insurance also can include more than just insurance. One cost included in the price is a title search. When a title search is conducted, a title agent or company reviews local records, such as deeds, mortgages, wills, divorce decrees, court judgments and tax records looking for any title issues with the property. In [INSERT STATE NAME], a title search must be done before a company can issue a title insurance policy.

If you’re buying a lender’s policy, the price of title insurance will depend on your loan amount.

Ask if You’re Eligible for Discounts

When you buy title insurance, ask if you’re eligible for any discounts.

If there was a previous title policy on the home (because the home changed owners or you’re refinancing), you may get a discount known as a “reissue rate.”

If you decide to buy both an owner’s and lender’s policy, you may get a discount if you buy both policies together.

The Difference Between Title and Homeowners Insurance

Title insurance is different from homeowners insurance.

- Title insurance protects you against past title problems. Homeowners insurance protects you against future issues that cause damage to your home or personal property. Homeowners insurance also limits your personal legal responsibility (or liability) if someone is injured while they’re on your property.
- Licensed title agents and companies sell title insurance. Insurance agents licensed to sell property, and casualty insurance sell homeowners insurance.
- You pay the premium for title insurance with a one-time payment, when you buy or refinance a home. A homeowners insurance policy is paid for on an ongoing basis and is up for renewal each year.
- Homeowners insurance does not protect your ownership in the property and does not replace the need for title insurance.

Questions to Ask Before You Buy Title Insurance

When you shop for title insurance, be sure to ask the title agent or company the following questions:

- How long have you been licensed to sell title insurance in [INSERT STATE]?
- What title insurance company do you sell policies for?
- Are title insurance premiums regulated in [INSERT STATE]?
- Are any discounts available?
- Are you related or affiliated in any way with my real estate agent, mortgage lender, builder, or attorney?
- Will anyone be paid a referral fee or commission or be compensated if I buy title insurance from you or a company you represent?
- In addition to title insurance premiums, what other fees and charges will I pay?
- What policy endorsements are available?
- Do you charge a cancellation fee if I don’t buy title insurance from you after you do a title search?
• Will I need to pay for a survey before you can sell me title insurance?

The Real Estate Closing

The last step to buying or refinancing a home / property is known as the closing.

Shortly after the seller accepts your offer to buy their home or the lender approves your refinancing, a closing date will be set.

A closing can be done in person, electronically or by mail. As part of the closing, you’ll be asked to sign the legal paperwork required to finalize the real estate transaction. On the day of the closing, you (as well as the seller) will be expected to pay any money owed.

If an in person closing is scheduled, expect the closing to last an hour or two. In addition to you, the seller, real estate agent(s), attorney, title agent and lender may attend the closing.

Make sure you understand what you’re being asked to sign.

During the closing, you’ll be signing documents that are legal binding contracts. Take time to understand what they mean. If you don’t understand something, ask someone to explain it to you, or ask for time to contact a trusted friend, family member, attorney or advisor for help.

One document you’ll be asked to review and sign is the closing disclosure. The closing disclosure shows all of the money to be paid to complete the transaction. Some of the costs listed on the closing disclosure will include:

• Outstanding mortgages to be paid.
• Money to be exchanged between the buyer and seller.
• The amount of the new loan(s).
• Loan origination charges.
• Property appraisal fees.
• Credit report fees.
• Real estate agent fees.
• Tax preparation fees.
• Property taxes owed.
• Escrow funds.
• Title insurance premiums.
• Courier fees.
• Settlement or closing fees.
• Closing protection fees.
• Document or recording fees.

Federal law gives you the right to see the closing disclosure at least three business days before closing. It’s highly recommended that you ask for a copy of the closing disclosure ahead of time so you have a chance to review it and ask questions.

If everything isn’t in order by your scheduled closing date, your closing date may be moved to another date.

After the closing, you’ll be given copies of all the documents you signed.
Closing Agents

Closing agents handle real estate closings and coordinate all of the steps required to make the real estate transaction official. They’re responsible for getting mortgage and loan pay-off amounts from the seller’s lender(s) and the amount of property taxes owed. They also give instructions to the buyer and seller, hold money until the home’s title is transferred, prepare documents for the buyer and seller to sign, pay out money owed and file documents with the county recorder, who updates records to show a property has changed owners.

Some title agents do more than just sell title insurance. They also conduct real estate closings by serving as a closing agent. Their responsibilities as a closing agent are separate from what they do as a title agent.

Other professionals, such as attorneys, also can be closing agents.

Questions to Ask When You Choose a Closing Agent

When you choose a closing agent, be sure to ask the following questions:

- Can you give me a list of all the fees and charges I would pay if you were my closing agent?
- What fees and charges are negotiable?
- Are your closing staff licensed title insurance agents?
- How and when do you conduct closings?
- Who will handle my closing?
- When will you give me a copy of the settlement statement?
- Do you have references or testimonials available?
- Do you offer closing protection coverage?
- How much does closing protection cost?

Closing Protection Letters

Title insurance doesn’t protect the lender or buyer against mistakes made during the closing, or if money is stolen or paid to the wrong parties. For an added fee, title insurance agents and companies that conduct real estate closings offer closing protection letters. If you buy a closing protection letter, the title insurance company will reimburse you for any money you lose from negligence, fraud, theft of funds or errors the closing agent made. Without this, you’d have to sue the agent to get back any money lost.

If you buy closing protection coverage, be sure to ask for a copy of the closing protection letter for your records.

Drafting Note: States who do not require closing protection should delete this section.

Shop Around for Title Insurance and Closing Services

As rates and fees for title insurance and closing services may vary, you should shop for title insurance and closing services. Use the chart that follows to learn how much you’ll be charged for certain rates, fees and services.

Beware Of Real Estate Wire Fraud Schemes

Money often needs to change hands quickly in a real estate transaction. One way to move money quickly is to have a financial institution wire it. Your real estate broker or agent, the title and closing agent, or an attorney will give you the details you need for a wire transfer.

Criminals can hack into professionals’ email systems to send emails that look as though they are coming from someone you’re working with. The emails can have fake instructions about wiring money for your upcoming closing. If you follow these instructions, your money will go to the scammer’s bank account. If that happens, you could lose your money.

To avoid being a victim of real estate wire fraud, you should:

• Call or personally meet with the professionals who will conduct the closing to learn how the closing will take place and how funds will be transferred.
• Get the names, telephone numbers, and mailing and email addresses for all of the professionals who will be involved with your closing.
• Be suspicious of all telephone or email messages about a change in the closing process. If you get such a message, call the professional you’re working with. Use the contact information they gave you, not the contact information in the message.
• Carefully examine all email addresses and telephone numbers associated with a message about your closing to verify the message really came from an individual you’ve been dealing with.
• Never respond to a message or click on a link if you’re asked to verify or provide bank account information.

What To Do If You Believe You’re The Victim of a Real Estate Wire Fraud Scheme

Report suspected wire fraud immediately!

If you suspect you’re the victim of real estate wire fraud, it’s important to immediately report your suspicions and take the following steps to increase the chances of recovering your money:

1) Contact your bank or wire transfer company to report your suspicions and ask for a wire recall.
2) Ask your bank to notify the financial institution that received your funds.
3) Call your local Federal Bureau of Investigation (FBI) office and report the crime.
4) File a report with the FBI’s Internet Crime Complaint Center by visiting www.ic3.gov

Drafting note: States who have Fraud units who investigate real estate wire fraud may wish to add a Step 5. Consumers should contact the Department of Insurance.

Final Tips to Remember

• Deal only with licensed professionals who’re in good standing in [INSERT STATE].
• As soon as you make an offer on a house or choose a lender to refinance with, start shopping for title insurance.
• Decide up front who’ll pay for the title insurance policies.

DRAFT: 3-23-215-25-21
Whoever buys the title insurance policy has the right to choose the title agent or title company.
A professional who recommends a title insurance company or agent to you may receive a commission or referral fee.
Ask the seller which title insurance company they used.
Ask friends or family who recently bought a home if they would recommend their title agent/company.
If you buy an owner’s policy, be sure the coverage is equal to the price you paid for your home.
Comparison shop, and get at least three quotes before you buy title insurance and closing services.
Ask about available discounts.
Ask title and closing agents for an itemized list of their fees and charges.
Ask for a copy of the title commitment at least three weeks before your closing date.
Know exactly what your title insurance policy will cover.
If your title agent also will be the closing agent, ask if closing protection coverage is available.
Ask the closing agent for a settlement statement at least one business day before your scheduled closing.
Be suspicious of all communications relating there’s been a change to the closing process.
Knowledge is power, so don’t be afraid to ask questions!
Read and understand all documents before signing them.
Request copies of all documents.
Keep a copy of your title insurance policy for as long as you own your property.
Immediately report suspected real estate wire fraud.

How to File a Title Insurance Claim

If an issue arises about your home’s title, contact your title insurance company as soon as possible. If you don’t know the name of your title insurance company, check the paperwork you signed when you bought or refinanced your home. You also can contact your title agent or closing agent for help.

[OTHER SOURCE NAME & INFO]
The Casualty Actuarial and Statistical (C) Task Force met August 10, 2021. The following Task Force members participated: Grace Arnold, Chair, represented by Phil Vigliaturo (MN); James J. Donelon, Vice Chair, represented by Nichole Torblaa (LA); Lori K. Wing-Heier represented by Katie Hegland (AK); Jim L. Ridling represented by Daniel Davis (AL); Evan G. Daniels represented by Tom Zuppan (AZ); Ricardo Lara represented by Mita Sanandajifar and Lynne Wehmuller (CA); Michael Conway represented by Mitchell Bronson (CO); Andrew N. Mais represented by Wanchin Chou (CT); Karima M. Woods represented by David Christhilf (DC); David Altmairer represented by Sandra Starnes (FL); Colin M. Hayashida represented by Randy Jacobson (HI); Doug Ommen represented by Travis Grassel (IA); Dana Popish Severinghaus represented by Reid McClintock (IL); Vicki Schmidt represented by Nicole Boyd (KS); Kathleen A. Birrane represented by Walter Dabrowski (MD); Eric A. Cioppa represented by Sandra Darby (ME); Anita G. Fox represented by Kevin Dyke (MI); Chlorella Lindley-Myers represented by Cynthia Amann (MO); Troy Downing (MT); Mike Causey represented by Arthur Schwartz (NC); Chris Nicolopoulou represented by Christian Citarella (NH); Russell Toal represented by Anna Krylova (NM); Barbara D. Richardson represented by Gennady Stolyarov (NV); Judith L. French represented by Tom Botsko (OH); Glen Mulready represented by Andrew Schallhorn (OK); Andrew R. Stolfi represented by David Dahl (OR); Jessica K. Altman represented by James DiSanto (PA); Raymond G. Farmer represented by Will Davis (SC); Doug Slape represented by Miriam Fisk (TX); Michael S. Pieciak represented by Rosemary Raszka (VT); Mike Kreidler represented by Eric Slavich (WA); James A. Dodrill represented by Juanita Wimmer (WV); and Jeff Rude represented by Tana Howard (WY). Also participating was: Gordon Hay (NE).

1. Adopted its July 13, June 8, May 11, and March 9 Minutes

Mr. Vigliaturo said the Task Force met July 13, June 8, and May 11. During these meetings, the Task Force adopted responses to the Blanks (E) Working Group and a request for NAIC staff to gather information about statistical reports.

The Task Force also met May 20 and April 20 in regulator-to-regulator session, pursuant to paragraph 3 (specific companies, entities or individuals) of the NAIC Policy Statement on Open Meetings, to discuss rate filing issues.

The Task Force held the following Predictive Analytics Book Club meetings: Sam Madden (Cambridge Mobile Telematics) presented on telematics in March and Radost Wenman (Pinnacle Actuarial Resources) presented on generalized linear models (GLMs) to generalized additive models (GAMs) in April. In June, the American Academy of Actuaries (Academy) arranged presentations for the NAIC’s Insurance Summit. Dorothy Andrews (Academy) and Hao Li (Verisk) presented on big data and modeling; Howard Kunst (CoreLogic) and Matt Chamberlain (Milliman) presented on catastrophe modeling; James Guszcza (Center for Advanced Study in Behavioral Sciences—CASBS at Stanford University), Dani Bauer (University of Wisconsin-Madison), and Birny Birnbaum (Center for Economic Justice—CEJ) presented on ethics in analytics, Ms. Andrews and Sam Kloese (NAIC) presented on GAMs; Michael Regier (Verisk) and Tim Hagan (Verisk) presented on regularization methods; Jonathan Fesenmeyer (Allstate) and Evan Petzdolt (Allstate) presented on geographic rating in personal lines insurance pricing; and Caolan Kovach-Orr (Verisk) and Vahid Meimand (Verisk) presented on tree-based models. In July, Larry Baeder (Milliman) presented on interpretable machine learning for insurance.

Ms. Darby made a motion, seconded by Mr. Grassel, to adopt the Task Force’s July 13 (Attachment One), June 8 (Attachment Two), May 11 (Attachment Three), and March 9 (see NAIC Proceedings – Spring 2021, Casualty Actuarial and Statistical (C) Task Force) minutes. The motion passed unanimously.

2. Adopted the Report of the Actuarial Opinion (C) Working Group

Ms. Krylova said the Actuarial Opinion (C) Working Group generally agreed that 2020 Statement of Actuarial Opinion submissions were fine but that some additional regulatory guidance would be helpful. Topics under discussion include reconciliation to Schedule P and a Board of Director’s review of qualification documentation. The actuarial opinion instructions will be revised to eliminate reference to the Casualty Actuarial Society’s (CAS) principles due to the CAS’ rescission of the reserving principles.
Ms. Krylova made a motion, seconded by Mr. Dyke, to adopt the report of the Actuarial Opinion (C) Working Group, including its July 22 (Attachment Four) and July 1 (Attachment Five) minutes. The motion passed unanimously.

3. **Adopted the Report of the Statistical Data (C) Working Group**

Mr. Vigliaturo said he appointed Ms. Darby as chair of the Statistical Data (C) Working Group. Ms. Darby said the Working Group has not met recently, but NAIC staff are reviewing auto and home data submissions.

4. **Discussed the U.S. Qualification Standard**

Mr. Vigliaturo said the Academy’s Committee on Qualifications released the second exposure draft of the U.S. Qualification Standards with a comment deadline of Aug. 20. Mr. Stolyarov said the changes made by the Academy were responsive to the comments the Task Force submitted on the first draft. He said he had preliminary discussions with NAIC staff about the second exposure draft, and some issues need discussion in regulator-to-regulator session. He said he is not sure another comment letter needs to be submitted, but state insurance regulators should discuss the issues and see if they can come to any agreement. Mr. Schwartz said he has some additional comments for discussion during the regulator-to-regulator session. He said one issue is that a new requirement was added in the second draft to require one hour of continuing education (CE) on bias topics.

Mr. Vigliaturo asked if anyone objected to a plan to meet in regulator-to-regulator session followed by an e-vote of any comment letter the following week. No objections were voiced. Mr. Vigliaturo said the deadline for comments is Aug. 20.

5. **Received a Report on Project #2019-49: Retroactive Reinsurance Exception**

Mr. Hay said he would present a proposal for discussion at the Fall National Meeting.

6. **Adopted a Charge for the Statistical Data (C) Working Group and Discussed Proposal 2021-11BWG**

Mr. Vigliaturo said the Task Force unanimously adopted a motion during its July 13 meeting to inform the Blanks (E) Working Group the Task Force is ready to provide guidance regarding the implementation of proposal 2021-11BWG if that proposal moves forward. The Blanks (E) Working Group met July 22 and took the following action: 1) deferred the revised proposal for comment until Oct. 22; 2) decided to send the revised proposal to the Task Force for review and comment; and 3) decided to send a referral to the Financial Analysis Solvency Tools (E) Working Group and the Financial Analysis (E) Working Group for review and comment about whether the information in the proposal would be useful for regulating for solvency purposes.

Mr. Birnbaum presented the changes made to the proposal (Attachment Six) since the Task Force’s July 13 meeting. He said the proposed additions would provide timely and useful information for financial and market analysis, the proposed additions are financial and not statistical data, and the proposed additions do not conflict with nor replace the Task Force’s statistical reporting. He asked the Task Force to support the proposal in its response to the Blanks (E) Working Group.

Mr. Chou asked whether an alternative option to speed up the statistical report of premium and exposure information would have a similar impact as the proposal. Mr. Birnbaum said then the blanks proposal would not be necessary. Currently, the statistical reporting machine does not provide that data until a year and a half after the end of the experience period. He said reinventing the statistical reporting system is not a short-term project. Ralph Blanchard (Travelers) said the premium and loss information at the policy form level is statistical information because it is not captured in financial reporting systems today. Ms. Starnes asked whether the quarterly reporting would include data by state or only nationwide. Mr. Birnbaum said it would be nationwide only on the quarterly statements. He said the information is still useful although it would be helpful to have by state information. Mr. Davis asked how the data would be used. Mr. Birnbaum replied that it might not be as useful to actuaries, but could be quite valuable to financial and market analysts.

Ms. Darby said NAIC staff gathered information in response to the request adopted by the Task Force on July 13 to provide the data and normal reporting times for the *Auto Insurance Database Report* and the *Dwelling, Fire, Homeowners Owner-Occupied, and Homeowners Tenant and Condominium/Cooperative Unit Owner’s Insurance Report* (Homeowners Report).

Ms. Darby said data for the *Auto Insurance Database Report* is obtained from four statistical agents—American Association of Insurance Services (AAIS), Insurance Services Office (ISO), Independent Statistical Services (ISS), and National Independent Statistical Service (NISS)—and four state entities—the California Department of Insurance (DOI), Massachusetts Commonwealth Automobile Reinsurers, Maryland Automobile Insurance Fund (MAIF), and the Texas DOI. Data received in
2021 would be for 2018/2019. The two years refer to written and earned premiums. For instance, in 2021, written exposures would be reported for 2019, and earned exposures would be reported for 2018. There are additional caveats, like earned exposures, and incurred claims for Texas are not available at all. Therefore, the Texas pure premium, frequency, and severity cannot be calculated. The NAIC currently receives two separate files from each entity—one for premiums and exposures and a second file for claims and losses. Currently, the timing for which each file is received is substantially the same.

Ms. Darby said data for the Homeowners Report is received from four statistical agents: the AAIS, the ISO, the NISS, and the American Property Casualty Insurance Association (APCIA); the California DOI; the Texas DOI; and multiple residual market programs. The reported data is two years behind the current calendar year. For example, 2019 data is reported in 2021. This report only includes premium and exposure data, all of which is included in one file.

For both publications, Ms. Darby said requests for data are sent to statistical agents, states, and residual market organizations in late January, with final data due from all entities in July. If all goes well, the data is clean and states are responsive regarding the state law section of the publication. Then the report can be completed in early fall. In recent years, there have been data concerns that needed to be addressed prior to release of the publications. There are fluctuations in the data due to different companies reporting to statistical agents from one year to the next, which can result in significant year-over-year (YOY) changes to premium and exposure data provided.

Ms. Darby said the information contained in both the Auto Insurance Database Report and Homeowners Report is voluntarily reported to the NAIC and not required through a data-sharing agreement. If the timeline were to be revised, all reporting entities would need to voluntarily agree to the change. Otherwise, there may need to be a formal agreement in place to get everyone on the same timeline going forward. Additionally, the Statistical Data (C) Working Group members would need to sign off on the changes, as they oversee the publications and any amendments would need to be considered for adoption. In terms of next steps, the Working Group can draft a letter, requesting that all of the organizations providing content for each report provide input and participate in a meeting to discuss the feasibility of an expedited timeline for reporting. Ms. Darby said the Task Force could additionally consider producing the reports in different formats or at different timelines, such as the earlier suggestion to consider reporting premium and loss data separately, along separate timelines. Again, the Task Force would need to confirm that each entity can abide by the expedited timeline and that they continue to be willing to do so under the voluntary nature of the reporting agreement.

Mr. Dyke said he is concerned about the quality checks that might be lost by receiving this data directly from companies. He said there is a robust data quality process that statistical reporting agents use. He is also concerned about potential misuse of the data. He said use of the data at a company level to identify trends could be misleading. For example, he said if there is more premium written in downtown Detroit, MI, then the average statewide premium would be higher but would not be a premium trend.

Mr. Chou made a motion, seconded by Mr. Dahl, to ask the Statistical Data (C) Working Group to gather information about the statistical reporting study can be completed prior to the deadline to respond to the Blanks (E) Working Group.

Mr. Birnbaum expressed concern whether the timeline can be sped up on receipt of premium and exposure information from outside parties. The Working Group should report back to the Task Force before Oct. 12. The motion passed unanimously. Mr. Birnbaum expressed concern whether the statistical reporting study can be completed prior to the deadline to respond to the Blanks (E) Working Group.

7. Received a Report on the NAIC Rate Model Reviews

Mr. Vigliaturo asked for a shortened report on rate model reviews due to time constraints during the meeting. Kris DeFrain (NAIC) said there are 30 states contracted with the NAIC using a Rate Review Support Services Agreement. She said the NAIC rate review team has produced 60 technical reports, with 47 standard GLMs, six regularized GLMs, 11 tree-based models (which includes random forests and GBMs), and five GAMs. She said there are sometimes more than one model in a filing. NAIC staff asked the Task Force if it would review the issues being evaluated for non-GLM models and provide guidance.

8. Heard Reports from Professional Actuarial Associations

Lauren Cavanaugh (Academy) said the Academy’s Casualty Practice Council formed a racial equity task force to address racial equity in the context of property/casualty (P/C) insurance. Comment letters were submitted to the NAIC and Colorado. Two issue briefs were published by the auto committee: 1) COVID-19; and 2) consumer cost of auto insurance. The Federal Insurance Office (FIO) asked for information on the availability and affordability of auto insurance. Derek Freihaut (Academy) said the Committee on Property and Liability Financial Reporting (COPLFR) is conducting its opinion seminar in December and is working on the law manual and practice note. He said COPLFR is seeking a regulatory member(s).
Brian Fannin (CAS) provided the CAS’ research report (Attachment Seven). Dale Hall (Society of Actuaries—SOA) provided the SOA’s research report (Attachment Eight).

Having no further business, the Casualty Actuarial and Statistical (C) Task Force adjourned.
Casualty Actuarial and Statistical (C) Task Force

Virtual Meeting
July 13, 2021

The Casualty Actuarial and Statistical (C) Task Force met July 13, 2021. The following Task Force members participated: Grace Arnold, Chair, represented by Phil Vigliaturo (MN); James J. Donelon, Vice Chair, represented by Nichole Torblaa (LA); Lori K. Wing-Heier represented by Sian Ng-Ashcraft (AK); Evan G. Daniels represented by Tom Zuppan (AZ); Ricardo Lara represented by Lynne Wehmueller (CA); Michael Conway represented by David Christhilf (DC); David Altmaier represented by Sandra Starnes (FL); Colin M. Hayashida represented by Randy Jacobson (HI); Doug Ommen represented by Travis Grassel (IA); Dana Popish Severinghaus represented by Judy Mottar (IL); Vicki Schmidt represented by Nicole Boyd (KS); Kathleen A. Birrane represented by Ron Coleman and Walter Dabrowski (MD); Eric A. Cioppa represented by Sandra Darby (ME); Anita G. Fox represented by Kevin Dyke (MI); Chlora Lindley-Myers represented by Cynthia Amann (MO); Troy Downing represented by Mari Kindberg (MT); Mike Causey represented by Kevin Conley and Arthur Schwartz (NC); Chris Nicolopoulos represented by Christian Citarella (NH); Marlene Caride represented by Carl Sornson (NJ); Russell Toal represented by Anna Krylova (NM); Barbara D. Richardson represented by Gennady Stolyarov (NV); Judith L. French represented by Tom Botsko (OH); Glen Mulready represented by Andrew Schallhorn (OK); Andrew R. Stolfi represented by Ying Liu (OR); Jessica K. Altman represented by Kevin Clark (PA); Raymond G. Farmer represented by Will Davis and Michael Wise (SC); Doug Slape represented by J’ne Byckovski (TX); Michael S. Pieciak represented by Rosemary Raszka (VT); Mike Kreidler represented by Manabu Mizushima (WA); James A. Dodrill represented by Juanita Wimmer (WV); and Jeff Rude represented by Donna Stewart (WY).

1. Adopted Responses to Referrals from the Blanks (E) Working Group

Mr. Vigliaturo said the Task Force exposed the two referrals from the Blanks (E) Working Group and received comments (Attachment One-A). State insurance regulators and interested parties presented highlights from their written comments. Birny Birnbaum (Center for Economic Justice—CEJ) referred to a July 12 letter responding to specific comments submitted (Attachment One-B) and proposed some changes to proposal 2021-11BWG. The revised proposal is attached (Attachment One-C).

State regulatory discussion about proposal 2021-11BWG included: limitations on the use of average premiums (mostly to evaluate changes over time); a desire to get premium and exposure data earlier than the NAIC statistical reports; a question whether statistical reports could be published with more recent data; a question whether market data should be in the statutory financial statements; a question whether data compilation would be costly for insurers; a comment that states have the ability to issue data calls to get this type of information; a comment that data is not vital from a solvency standpoint so should not be in the statutory financial statements; and a desire to improve methods for reporting statistical data to the NAIC.

Mr. Birnbaum explained that the statistical reports cannot be sped up because the statistical agents collect claims data in addition to premium and exposure data. He added there are four statistical agents and two states that submit data, and then there is a significant amount of NAIC staff time taken to evaluate the data and fix reporting errors. He said use of data calls would result in a greater expense to insurers, and the reporting would not be uniform from one state to another.

Ms. Torblaa made a motion, seconded by Mr. Davis, to inform the Blanks (E) Working Group that the Task Force does not support proposal 2021-11BWG, but if the proposal does move forward for adoption, then the Task Force would offer additional guidance on the content. Discussion included it being premature to decide whether to support the proposal. Mr. Stolyarov requested a roll call vote. The motion failed 9-17 with four abstentions.

Mr. Schwartz made a motion, seconded by Mr. Jacobson, to request NAIC staff provide documentation to see sources of data for the auto and home reports and the time frames it takes to collect each of those pieces of data. The motion passed unanimously.

Mr. Stolyarov made a motion, seconded by Ms. Darby, to inform the Blanks (E) Working Group that the Task Force is ready to provide guidance regarding the implementation of proposal 2021-11BWG if that proposal moves forward. Furthermore, the
Task Force requests that Mr. Birnbaum submit the most current up-to-date version of the proposal for further consideration and suggestions from the Task Force. The motion passed unanimously.

Discussion about proposal 2021-13BWG included: a desire to have the proposed additional other liability data; a potential to add foster care other liability; a comment that the number of pieces seems too detailed; and a comment that incurred but not reported (IBNR) reserves are likely not available at this level of detail for most companies.

Ms. Torblaa made a motion, seconded by Mr. Davis, to inform the Blanks (E) Working Group that the Task Force supports proposal 2021-13BWG (with or without modification to the proposed lines of business), but it recommends that the reporting of IBNR be modified to be reporting of case reserves because the IBNR is likely not available at this level of detail. The motion passed unanimously.

2. **Discussed Exposure of the Academy’s U.S. Qualification Standards**

Mr. Vigliaturo said the Task Force commented on the first exposure draft of the American Academy of Actuaries (Academy) U.S. Qualification Standards. A second exposure has been released. Mr. Stolyarov and Mr. Schwartz volunteered to draft a comment letter for the Task Force’s consideration.

Having no further business, the Casualty Actuarial and Statistical (C) Task Force adjourned.

kdefrain@naic.org

Re: 2021 NAIC Blanks Proposals 2021-11BWG and 2021-13BWG

Dear Mr. Vigliaturo:

On behalf of the Committee on Property and Liability Financial Reporting (COPLFR) of the American Academy of Actuaries, I appreciate this opportunity to provide comments on the proposed changes to the financial requirements exposed by the Blanks (E) Working Group of the National Association of Insurance Commissioners (NAIC) which requested the Casualty Actuarial and Statistical (C) Task Force (CASTF) to review and evaluate the proposals and provide it with comments on issues that might affect the work of the CASTF or on interested parties concerns. The CASTF requested public comments on June 8, 2021, to be submitted with a deadline of July 7, 2021.

COPLFR appreciates your consideration of our comments.

The exposed two proposals that we would like to provide comment on.

I. 2021-11BWG- Add a new annual statement supplement to the Property and Casualty (P/C) statement to capture exposure data for Annual Statement Lines 2.5, 4, 19.1, 19.2 and 21.2 of the Exhibit of Premiums and Losses. Add a column to the Quarterly Parts 1 and 2 to capture exposure data for these annual statement lines for the quarter.

---

1 The American Academy of Actuaries is a 19,500-member professional association whose mission is to serve the public and the U.S. actuarial profession. For more than 50 years, the Academy has assisted public policymakers on all levels by providing leadership, objective expertise, and actuarial advice on risk and financial security issues. The Academy also sets qualification, practice, and professionalism standards for actuaries in the United States.
II. 2021-13BWG- Add a new supplement to capture premium and loss data for Annual Statement Lines 17.1, 17.2 and 17.3 of the Exhibit of Premiums and Losses (State Page) – Other Liability by more granular lines of business.

We believe that the potential benefit that may be derived by the public from having access to additional reported information needs to be considered relative to the effort to obtain the additional information. We also believe that the quality and consistency of the data that would be provided under the proposals are a concern, and that the proposals should ensure the additional data will serve the intended use.

The level of detail that would be requested by the two exposure drafts is not regularly captured in typical company financial data systems. It will require time for each company to clarify the detailed requirements and then additional lead time to implement within individual company systems to ensure quality data can be provided.

The value of the reported data will depend on what is available from each specific company. Additional granularity of some data may still only be achieved through judgment and allocations made at the individual company level. This often makes detailed information less valuable once obtained and aggregated to the industry level. In addition, requesting data with unclear requirements and with definitions not commonly used across the industry is not likely to produce consistent and useful quality data.

Specific issues that we would like to point out, given the currently provided details of these two proposals, are separately discussed below.

2021-11BWG

- **Definition of exposure**—A clearer definition of how exposure should be calculated for each requested line is needed. Some lines where this additional information is requested contain significant issues related to mix of exposure.
  - For example, “Homeowners line 4” contains exposures varying in type including owner occupied, apartment renters, condo owners, and mobile home owners, with significantly varying lines of amount of insurance per exposure.
  - For Auto lines, would exposure for a policy having Comprehensive & Collision coverage be measured similarly to a policy containing only one Physical Damage coverage?

Comparison year over year within each company will be distorted when there are material changes in mix across these various types of exposures. Comparisons between companies could also be distorted. We recognize that this aggregated information is regularly used to compare premium but comparing average premiums could be distorted.

- **Calendar date alignment**—We note that the timing for the source of exposure data requested (that is available currently in company ratemaking systems) may not match the financial reporting data for financial premium. Exposures are typically maintained in detailed policy-based systems along with policy premium and are provided on a policy year basis. They are often separate from financial reporting systems where premium is on
a calendar-year-earned basis. While premiums from ratemaking and financial systems could be reconciled, they might not provide a precise match. We note that data from ratemaking systems is already available and provided when requested by regulators or through specific data calls and filing inquiries.

- **Existing alternative data sources**—Some of the data requested is already available through statistical plan reporting which may meet the intended need. Statistical plan data is primarily available to regulators (the restricted availability is intended to protect the proprietary nature of each company’s data).

Changes that COPLFR would suggest that would improve the proposal (2021-11BWG):

- Include a complete and clear definition of exposure and calculation for each line proposed, particularly as respects the crossing (or overlap) of calendar time periods. Clear specifications ensure greater consistency across companies reporting.
- Definitions that account or minimize distortions from mix would be recommended.
- If these requests move forward to requirements, we respectfully suggest a 2023 implementation date as the earliest date for achievement of those requests.
- We recommend that flood coverage (Annual Statement Line 2.5) be removed from the proposal, as flood has a mix of both Personal and Commercial policies, written on both primary and excess bases.

**2021-13-BWG**

- **Granularity and definition**—The (29) proposed components of additional reporting for Other Liability will require clear definition (or instruction) on how to map class plan or package policies to these new required sublines of Other Liability. Significant judgment will be necessary at the individual company level depending on the policies written by that company. It is not clear that the proposed sublines are exclusively defined to eliminate overlap, nor that they will subsequently add up to the whole (e.g., internet liability vs cyber; employee benefit liability vs. fiduciary; one package policy covering three sublines of liability). A particular policy type could possibly be matched to one reporting line or another, generating inconsistency across companies, or year after year as policy changes evolve or new products are distributed. It is not clear why more granularity of data would not be put into the statistical data requirements, rather than being added into the Annual Statement. The proposal notes an additional Appendix defining the 29 granular pieces, but we do not find those proposed components included in the exposure draft for review.
- **Credibility/Quality (IBNR)**—We note that further subdividing the Liability data, already sparse in areas, will not necessarily provide valuable additional information across all the data elements requested. Inclusion of Incurred But Not Reported (IBNR) reserves at this new granular level of detail will most likely be arrived at through a company-determined allocation process. Liability is generally a low frequency / high severity line of business. Actuarial reserves for Liability are necessarily analyzed at higher levels of aggregated data to arrive at meaningful estimates and to reduce volatility in those reserve estimates.
over time. While some companies may segment Liability into credible pieces given their business profile, likely no company utilizes the (29) sublines proposed in their derivation of IBNR reserves.

- **Inconsistency with the underlying policies**—We find that this breakout of a broad type/cause of loss product such as Liability would be excessive and also is not consistent with the purpose of the General Liability policy, which is to provide broader aggregated coverage across a variety of situations which by themselves may not be as easily or affordably insurable.

- **Preparation**—The proposed breakouts of Other Liability as currently listed as the sublines requested would not be consistently defined across companies. If this list will continue to change, it should be noted that the value and quality of the information would be reduced with each change, and each change would require additional company preparation time as well as discretion to report. Given appropriate time to prepare systems for this change, the quality of the data would improve.

Changes that COPLFR would suggest that would improve the proposal (2021-13-BWG):

- Remove the requirement to include IBNR reserves from this new granular level of Liability reporting.
- Clearly define the sublines and eliminate any overlap or redundancies. Balance the additional information requested with the value added by collecting that additional granularity. For example, what is the difference between cyber and internet liability? Where would you categorize a package Liability policy that provides coverage across three of the above proposed sublines?
- Please provide and expose for comment the Appendix noted in the proposal that clearly defines the lines and coverages requested.
- Provide sufficient lead time for system preparation and implementation to improve the quality of data obtained. If these requests move forward to requirements, we respectfully suggest a 2023 implementation date as the earliest date for achievement of those requests.

COPLFR appreciates this opportunity to provide comments to the NAIC Blanks Working Group (and CASTF). We hope these observations are helpful, and we welcome further discussion. If you have any questions about our comments, please contact Rob Fischer, the Academy’s casualty policy analyst, at fischer@actuary.org.

RE: Blanks Proposals

Dear Casualty Actuarial and Statistical Task Force Committee Members:

The American Property Casualty Insurance Association (APCIA)¹ appreciates the opportunity to provide feedback to the National Association of Insurance Commissioners’ (NAIC) Casualty Actuarial and Statistical (C) Task Force (CASTF) on the two referrals from the Blanks (E) Working Group. APCIA has significant concerns with both proposals and respectfully requests that CASTF not support their adoption.

New Supplement to Capture Property/Casualty Direct Exposure Written and Direct Exposure Earned

During CASTF’s initial discussion of the exposure for a new annual supplement to the financial statement for property and casualty direct exposure written and direct exposure earned, there was support for the proposition that this proposal would provide more timely information. Unfortunately, using this proposal to gain more timely information will lead to misleading data for both regulators and the public. Additionally, the public nature of these filings will offer competitor insight into proprietary information. As noted by at least one regulator on the call, regulators already have tools available to them to obtain necessary timely data. For example, regulators have the authority to review company data if they have concerns, and the Schedule P and Actuarial Statement of Opinion in the Annual Statement and rate filing submissions can also elicit the data sought. Even if this data is insufficient, the regulators have access to detailed market conduct data. Finally, regulators and industry worked well together to develop a data call under difficult circumstances to provide necessary information during the pandemic. APCIA struggles to identify why regulators need this new publicly available supplement data when there are many additional avenues to obtain this information.

Significantly, this proposal will sacrifice timely data for misleading data. The defined Exposure counts may, in some instances, not be appropriately inclusive of the coverage reported under the respected Annual Statement Line of Business. The Interested Party comment letter filed with the Blanks Working Group

¹ Representing nearly 60 percent of the U.S. property casualty insurance market, the American Property Casualty Insurance Association (APCIA) promotes and protects the viability of private competition for the benefit of consumers and insurers. APCIA represents the broadest cross-section of home, auto, and business insurers of any national trade association. APCIA members represent all sizes, structures, and regions, protecting families, communities, and businesses in the U.S. and across the globe.
provides the following useful example: “If ASL 4 Homeowners Exposures is all inclusive, the proposal to count written and earned ‘residences’ would include an array of policies ranging from rental policies to mansions, resulting in an average premium that has no real value to users. If ASL 4 Exposure does not include condo and/or rental policies, then the average premium would be misleadingly inflated.”

The consequences of misleading data, availability of alternative sources for timely information, and impact of the availability of proprietary information to competitors all suggest that this proposal should not be advanced.

New Supplement to Capture Property/Casualty Premium and Loss Data
APCIA notes that this proposal has some ambiguities and ultimately will not provide the insights that may be sought. For instance, there will be inconsistencies in reporting as companies use their individual judgment to identify how a package policy would fit into the new sublines and there is some question as to whether the reporting method will eliminate overlap or just cause additional confusion.

Further, this proposal will require a significant amount of work to retool systems to be able to capture the information as requested. The resulting capital and human resource costs are not necessary when regulators can request this detail from individual companies on a case-by-case basis or through a data call.

Thank you for the opportunity to comment. APCIA encourages members of CASTF to review the comment letters that have already been submitted to the Blanks Working Group for additional observations.

Respectfully submitted,

Angela Gleason
June 25, 2021

Mr. Jake Garn, Chair
Blanks Working Group
National Association of Insurance Commissioners
1100 Walnut St.
Kansas City, MO  64106

SUBJECT:   Blanks Working Group ("BWG") proposals exposed during the conference call on May 26, 2021

Dear Mr. Garn:

Interested parties ("IPs") appreciate the opportunity to review and comment on the 5 proposals that were exposed during a conference call by BWG on Wednesday, May 26, 2021.

2021-10     [Exposed changes remove language in Line 4.1 of the quarterly General Interrogatories Part 1 that requires filing of a quarterly merger/history form, which does not function with the database system as currently designed. The annual form shall still be required. Anticipated effective date is 1st Quarter 2022]

   IPs have no comments.
Exposed changes to add a new annual statement supplement in the Property/Casualty Statement to capture direct exposures written and direct exposures earned which will be reported for Annual Statement Lines 2.5, 4, 19.1, 19.2 and 21.2; also, add a column to the Quarterly Parts 1 and 2 to capture exposure data for these annual statement lines for the quarter. Anticipated effective date is 1st Quarter 2022 / Annual 2022]

IPs do not support 2021-11BWG for several reasons. Primarily, we are concerned that a fatal flaw exists at the core of this proposal, which, if adopted, would result in the reporting of misleading information and potentially provide competitors with proprietary information. We believe that there is no benefit to providing information on a timely basis if that information is misleading. The fatal flaw and additional concerns are outlined in the following discussion.

Fatal flaw: IPs believe that this proposal, if adopted, would result in misleading information and provide competitor insight into proprietary information.

The proposal focuses on collecting defined Exposure counts of specific ASLs, while presenting and analyzing it with total Premiums reported in the respective ASL. These defined Exposure counts may in some instances not be appropriately inclusive of the coverage reported under the respective ASL. For example, if ASL 4 Homeowners Exposures is all inclusive, the proposal to count written and earned “residences” would include an array of policies ranging from rental policies to mansions, resulting in an average premium that has no real value to users. If ASL 4 Exposure does not include condo and/or rental polices, then the average premium would be misleadingly inflated. For ASL 19.2 auto policies, if Premiums include, but Exposures exclude, miscellaneous vehicles, such as golf carts, private passenger trailers, and all-terrain vehicles, the average premium would be inflated. Furthermore, how misleading this broadly applied average may be for any individual company depends on the size and mix of their business reported under each ASL impacted by the proposal. This information, taken out of context, could be negatively construed and lead to detrimental results for companies. At the same time, publicizing Exposure counts by company would provide competitors with proprietary information.

The existing reports cited in this proposal (i.e. "Auto Database Report" and "Dwelling, Fire, Homeowners Owner-Occupied, and Homeowners Tenant and Condominium/Cooperative Unit Owners" reports) may be distributed with a time lag, but they also have important context and underlying details, such as business line detail, which helps analyze and understand the data. The "Dwelling, Fire, Homeowners Owner-Occupied, and Homeowners Tenant and Condominium/Cooperative Unit Owners" report issued in 2020 was almost 200 pages of data and narrative and included the fact that some of the information came from residual market data providers. The "Auto Database Report" issued in February 2021 was 255 pages and also acknowledged "Written premium and written exposure data were obtained from AAIS, ISO, ISS, NISS, the California Department of Insurance, the Texas Department of Insurance, MAIF, and the M-CAR". Additionally, the existing reports provide aggregate information and do not reveal company specific details. If the primary reason for this proposal is faster information, perhaps a more prudent approach would be a discussion with CASTF regarding whether opportunities exist in the process to produce quicker publication of existing reports.
Additional concerns:
1. The proposal’s justification included a comment that “…the severe time lag between actual experience and reporting fails to inform the public or policymakers of recent trends or outcomes and can, consequently, mislead the public and policymakers.” However, other data exists in quarterly and annual financial filings, and in rate filings, that can be used to identify meaningful trends. We would contend that the proposal, if adopted, would result in misleading information for which detailed clarification would not exist at the same time. This could have detrimental results to companies and the states in which they do business.

2. It is unclear to IPs why the disclosures in this proposal are needed. Regulators already have the authority to review a company’s data and operation if they have specific concerns. There is also a significant amount of company-level and more granular data and information available to regulators in Schedule P and the Actuarial Statement of Opinion in the annual statement, as well as in rate filing submissions. In addition, statistical data may be provided via statistical agents (e.g. ISO) rather than from individual companies. And, if this vast amount of data is insufficient for a regulatory need, regulators also have access to companies’ detailed market conduct data. IPs strongly believe these data sources obviate any need for the highly sensitive public disclosures contemplated in this proposal.

3. The proposal’s justification included, “Consider how valuable timely average premium values would have been for personal lines as the pandemic unfolded.” How would this data have been used? Is this to suggest that misleading average premiums would have been used as actionable information toward insurers? To what end? At this point, we are still seeing longer-reaching pandemic impacts such as repair/replacement cost increases due to unexpected supply shortages. Taking today’s general average premium per exposure out of context and adding a prospective narrative would be misleading and the possibility of it is concerning.

4. Does the definition of Exposure match that used for Exposure in the cited existing reports? If not, this would result in a disconnect between the proposed annual reporting and the cited existing reports.

5. Providing statistical data via financial reporting. Statistical data may be provided via statistical agents, such as ISO, rather than directly from individual companies. Therefore, not all companies have this Exposure information available today, or may not be available as defined, and would require enough time to implement. However, IPs do not believe this is a cost that would benefit policyholders or regulators.

IPs recommend that this exposure be rejected and that the regulators consider the need for ‘Exposure’ data within the annual statement filing process.
**2021-12** [Exposed changes to modify the Analysis of Operations by Lines of Business – Accident and Health for Life/Fraternal entities by adding and deleting lines to capture health specific data captured on the Health Analysis of Operations by Lines of Business but not on the Life/Fraternal Analysis of Operations page; also, add new crosschecks for the new lines and new crosschecks to the Analysis of Operations by Lines of Business – Summary to map the lines on the accident and health page to the summary. The purpose of the proposal is to modify the Analysis of Operations by Lines of Business – Accident and Health for Life/Fraternal entities to capture health specific data points captured on the Health Analysis of Operations page. Anticipated effective date is Annual 2022]

IPs offer the following general comments and request an extended comment period for this item to allow additional time for further evaluation. Since the suggested effective date is Annual 2022, there is still time to review, analyze and revise this proposal.

- The NAIC recently implemented changes to the 2019 annual statement for Life/Fraternal entities modifying the Analysis of Operations by Lines of Business (ANAOPS) to provide a more detailed breakdown by product group with a corresponding Summary page; considerable time and cost was spent by the NAIC and industry to develop and capture the revised reporting requirements. To comply with this proposal, the NAIC and industry would be required to develop and implement additional system updates again. This proposal requires more granular details, specifically for lines 1 and 9, which may not be readily available.
- The proposed changes would result in inconsistencies between the ANAOPS – Summary page and the ANAOPS – Lines of Business pages by creating different lines. The changes would negate current validations the NAIC has in place between the Summary and the detail pages, making the flow of information difficult to follow.
- The format changes suggested in this proposal would be in direct conflict with the tying in of data that the Schedule H proposal (2021-14BWG) is trying to achieve.
- Instead of the proposed changes to modify the existing ANAOPS – Accident and Health page, IPs recommend that consideration be given to retaining the current ANAOPS structure by developing an alternative method to capture the additional data separately. In addition, clarity would be needed on how certain products would be reflected in certain lines (e.g. LTC and DI benefits in lines 9.1 and 9.6). Perhaps the sponsors of this proposal and 2021-14BWG could collaborate on alternative reporting methods.
- IPs recommend making the following editorial revisions if this item moves forward as exposed:
  - On page 2 of the PDF, the instructions for ‘Line 1.6’ should be changed from “in the Exhibit, Part 1” to “in Exhibit 1, Part 1”.
  - On page 3 of the PDF, the instructions for ‘Line 7.2’ should be changed from “Aggregated at Line 8.3” to “Aggregated at Line 7.2”.
  - On page 5 of the PDF, the instructions for ‘Line 9.5’ should be changed from “Hospital/Medical Benefits on Line 9.2” to “Hospital/Medical Benefits on Line 9.1”.

© 2021 National Association of Insurance Commissioners
Exposed changes add a new supplement (Exhibit of Other Liabilities By Lines Of Business) to the Property annual statement to capture premium and loss data for Annual Statement Lines 17.1, 17.2 & 17.3 of the Exhibit of Premiums and Losses (State Page) – Other Liability to provide regulators more granular detail of the premium and losses of the diverse lines of business reported on such lines. Anticipated effective date is Annual 2022]

IPs offer the following comments, but also request an extended comment period for this item to allow additional time to further evaluate the significant proposed changes to the Property statement. Since the suggested effective date is Annual 2022, there is still time to review, analyze and revise this proposal.

- Business reported in ASL 17 is not usually internally managed to this proposed level of granularity; therefore, data infrastructure does not exist to capture or calculate all the requested data at this level (i.e. IBNR). A large expenditure of both NAIC and industry resources would be required to achieve this level of reporting. Regulators could request this detailed information from individual companies on a case-by-case basis where there is concern or the data seems relevant and meaningful. In addition, data calls could be used.
- If this item moves forward as exposed, IPs recommend that a new question be added to the 2022 Supplemental Exhibits and Schedules Interrogatories related to the filing of this new exhibit.
- IPs recommend making the following editorial revision if this item moves forward as exposed:
  - On page 2 of the PDF, the reference “Line 26 – All Other” should be “Line 29 – All Other”.

© 2021 National Association of Insurance Commissioners
Exposed changes expand the number of lines of business reported on Schedule H (Accident and Health Exhibit) to match the lines of business reported on the Health Statement and modify the instructions to be uniform between life/fraternal and property. The purpose of the proposal is to bring uniformity in the accident and health lines of business used on Schedule H with other schedules and exhibits in the annual statement. Anticipated effective date is Annual 2022.

IPs request an extended comment period for this item to allow interested parties additional time to evaluate the impacts to the Life/Fraternal and Property blanks. Since the suggested effective date is Annual 2022, there is still time to review, analyze, and revise this proposal as needed.

IPs recommend the following editorial revisions:

Use a consistent description for the 2 Comprehensive Hospital and Medical lines of business throughout 2020-33BWG_Modified (Health ASLs – Property Blank) and 2021-14BWG (Schedule H) as indicated below.

- Comprehensive (Hospital and Medical) Individual
- Comprehensive (Hospital and Medical) Group

2020-33BWG_Modified:
- Underwriting & Investment Exhibit I Parts 1, 1A, 1B, 2, and 2A
  - 13.1 Comprehensive (hospital and medical) individual
  - 13.2 Comprehensive (hospital and medical) group
- Insurance Expense Exhibit Parts II and III
  - 13.1 Comprehensive Individual
  - 13.2 Comprehensive Group
- Exhibit of Premiums and Losses (Statutory Page 14)
  - 13.1 Comprehensive (hospital and medical) Individual
  - 13.2 Comprehensive (hospital and medical) Group
- Quarterly PART 1 – LOSS EXPERIENCE and PART 2 – DIRECT PREMIUMS WRITTEN
  - 13.1 Comprehensive (hospital and medical) individual
  - 13.2 Comprehensive (hospital and medical) group
- Appendix P&C LOB
  - 13 Comprehensive (Hospital and Medical)

2021-14BWG:
- Underwriting & Investment Exhibit I Parts 1, 1A, 1B, 2, and 2A
  - 13.1 Comprehensive Individual Accident and Health
  - 13.2 Comprehensive Group Accident and Health
- Schedule H column headings:
  - Comprehensive (Hospital and Medical) Individual
  - Comprehensive (Hospital and Medical) Group

Re: 2021-11BWG

Dear Chair,

We appreciate the opportunity to submit the following comments on the 2021-11BWG proposal.

As the NAIC puts it, “The public wants two things from insurance regulators:
They want solvent insurers who are financially able to make good on the promises they have made, and
they want insurers to treat policyholders and claimants fairly. All regulatory functions will fall under
either solvency regulation or market regulation to meet these two objectives.”

We support the idea to have more timely report of current NAIC Homeowners Report and Auto Report.
We also appreciate the spirit of this proposal to address regulatory concerns regarding the needed
average written and average earned premium for residential property and personal auto coverages in a
far more timely fashion for market regulation. That said, we do not believe the proposal appropriately
addresses the root causes of problems, nor do we believe that the proposal as currently drafted would
meet the market regulation needs to provide accurate statistical reports in a timely manner.

Current NAIC Homeowners Report has 5 tables with statistics for house-years by state and countrywide
by policy type, policy form, amount of insurance, and average premiums by policy form/amount of
insurance by homeowners owner-occupied and tenants. NAIC Auto Report has 5 tables with statistics
for average premiums and expenditures for Liability, Collision and Comprehensive. The Auto Report also
has many tables for voluntary/residual, limits, and others by coverage. Although current NAIC statistics
reports have significant time lag, it does provide the accuracy and consistency for the needed statistics.
To create a supplement to those specific annual statement lines (ASL) without clearly defined statistics
and accuracy, the benefits are very limited if not also very confusing.

It is better to be late than incomplete or inaccurate. Different companies in different states may have
different market segment mix in term of coverage forms, house value, etc. 2021-11BWG proposal with
aggregate level exposures by state may create misleading results and conclusions. Similar situations will
also exist in the personal auto coverages. More exposures information with more granulated details is
available in the current NAIC Homeowners Report and Auto Report as described above, with some time
lag.

As an alternative, we would suggest looking at the current NAIC statistics reports and identify the root
causes of problems in time delay. If companies are using timely data to grow their business
strategically, NAIC and regulators should be able to work with the industry to improve the time lag. Are
the problems coming from delay reporting in specific few companies? Are the problems coming from
too many required statistics in the process? Are the problems coming from inconsistent reporting
databases?
We appreciate the consideration of our comments and look forward to discussing on a future call.

Best Regards,

Subject: Louisiana Comments regarding 2021-11BWG and 2021-13BWG Exposure Drafts

Louisiana does not support moving either Blanks proposal 2021-11BWG or 2021-13BWG forward at this time.

Proposal 2021-11BWG

2021-11BWG proposes a new annual statement supplement to the Property and Casualty (P/C) statement to capture exposure data for Annual Statement Lines 2.5, 4, 19.1, 19.2 and 21.2 of the Exhibit of Premiums and Losses. It adds a column to the Quarterly Parts 1 and 2 to capture exposure data for these annual statement lines for the quarter. According to the author, “This AS and QS Blanks proposal would allow the calculation of average written and average earned premium for residential property and personal auto coverages in a far more timely fashion.”

Louisiana believes it is premature to consider the proposed changes to financial statement exhibits and that this proposal should be studied by CASTF before changes to financial exhibits are made. If more current average premiums are needed, CASTF should create a supplemental report, to existing CASTF reports, that includes average premium on a timelier reporting schedule.

- Louisiana characterizes the data requested to be general/actuarial/rate information and not information that improves solvency regulation. The purpose and context of the AS and QS statements is the monitoring and regulation of company solvency. The proposed data does not fit within the context of solvency’s financial statements for collection, even if convenient. When discussing with Louisiana financial analysts, their comment is they have never felt this type of data was needed and, if made available by this proposal, would probably not be analyzed. If needed, our financial analyst would request such data on a case-by-case basis (which has never been done in Louisiana).
- The expense to companies to build a system to report the requested information outweighs its value to state regulators.
  - The collection of this data will require companies to build a new system to capture and report exposure details.
  - The collection of this new data, unless validated/audited, will be of limited value.
  - The proposal, though resulting in more current calculation of average premiums, will have its own set of issues, e.g., reliability when comparing state data because it only reports on the aggregation across coverages and forms; it is not a separate reporting by coverage or form as with the existing CASTF reports.
- Even though the average premiums from CASTF’s “Auto Database Report” and “ Dwelling Fire, Homeowners Owner-Occupied, and Homeowners Tenant and Condominium/Cooperative Unit Owners’ Insurance Report: Data for XXXX” may be “stale,” the average premium rankings do not change significantly over the course of two years and the reported average premiums remain useful for comparison purposes. The proposed data
collection and frequency (quarterly) would not add great value above the existing reports’ primary use.

- An increase in expenses to companies will be passed along to consumers in the form of higher premiums.
- Lastly and importantly, the collection of more timely average premium data, to supplement the existing CASTF “Auto Database Report” and “Dwelling Fire, Homeowners Owner-Occupied, and Homeowners Tenant and Condominium/Cooperative Unit Owners’ Insurance Report: Data for XXXX”, can easily, efficiently, and effectively be requested by CASTF as a supplemental report (either annual or quarterly). Such supplemental report can be integrated into the existing CASTF report workstream and can be reported upon either annually or quarterly. This new report would be for just average premiums (no loss data) and would not be expensive to create or disruptive to financial reporting requirements and systems.

Proposal 2021-13BWG

2021-13BWG proposes adding a new supplement to capture premium and loss data for Annual Statement Lines 17.1, 17.2 and 17.3 of the Exhibit of Premiums and Losses (State Page) – Other Liability by more granular lines of business. The purpose of this proposal is to provide regulators more granular detail of the premium and losses of the diverse lines of business reported on Annual Statement Lines 17.1, 17.2 & 17.3 of the Exhibit of Premiums and Losses (State Page).

Louisiana believes it is premature to consider the proposed changes to financial statement exhibits and that this proposal should be studied by CASTF before changes to financial exhibits are made. If more detailed liability data is needed, CASTF could create a supplemental report that includes average premium on a timelier reporting schedule.

- Louisiana characterizes the data requested to be general/actuarial/rate information and not information that improves solvency regulation. The purpose and context of the AS and QS statements is the monitoring and regulation of company solvency. The proposed data does not fit within the context of solvency’s financial statements for collection, even if convenient. When discussing with Louisiana financial analysts, their comment is they have never felt this type of refined data was needed and, if made available by this proposal, would probably not be analyzed. If needed, our financial analyst would request such data on a case-by-case basis (which has never been done in Louisiana).

- The expense to companies to build a system to report the requested information outweighs its value to state regulators.
  - The collection of this data will require companies to build a new system to capture and report the refined premium, exposure, loss, and expense details.
  - The collection of this new data, unless validated/audited, will be of limited value.
  - Louisiana would not be interested in having this data available. The collection of more detailed other liability data can easily be requested by individual states on a case-by-
case basis. Such a state request would not be as expensive to create or disruptive to financial reporting requirements impacting the entire commercial industry.

- An increase in expenses to companies will be passed along to consumers in the form of higher premiums.

RE: 2021-11BWG and 2021-13BWG

Dear Chair, Vice Chair, and Task Force Members:

On behalf of the member companies of the National Association of Mutual Insurance Companies\(^1\) we respectfully submit these comments which are responsive to the proposed changes to the annual and quarterly statement blanks that, if adopted, would add a new annual statement supplement to capture direct exposures written and direct exposures earned for certain lines of business (2021-11BWG). It would also add a new exhibit in the statement of Premium and Losses (State Page) to capture more details regarding certain line of business premium and loss data (2021-13BWG). We submit these comments in hopes that regulators will join us in the effort to protect and educate consumers with relevant, timely information so that they may find the right product, at the right price, at the right time.

Although there is a strong desire to partner with regulators to resolve several outstanding issues, the NAMIC membership opposes both proposals as exposed. Further, we have specifically requested the Blanks (E) Working Group reject Agenda Item 2021-11BWG and provide an extended comment period for Agenda Item 2021-13BWG. NAMIC members support the Interested Parties comment letter (dated June 25, 2021) to the Financial Condition Blanks Working Group, stating their opposition to agenda item 2021-11BWG and their request for an extended comment period for Agenda Item 2021-13BWG. However, it is impossible to support an effective date for Annual 2022 for either proposal. We respectfully request that an effective date not be established until a policy decision is made as to whether the information requested serves a specific regulatory need. This shall include

\(^1\) The National Association of Mutual Insurance Companies is the largest property/casualty insurance trade group with a diverse membership of more than 1,400 local, regional, and national member companies, including seven of the top 10 property/casualty insurers in the United States. NAMIC members lead the personal lines sector representing 66 percent of the homeowner’s insurance market and 53 percent of the auto market. Through our advocacy programs we promote public policy solutions that benefit NAMIC member companies and the policyholders they serve and foster greater understanding and recognition of the unique alignment of interests between management and policyholders of mutual companies.
a full cost/benefit analysis for each proposal to ensure that the information being requested is meaningful and relevant to the consumer and the costs associated with implementation and compliance for both regulator and industry don’t outweigh the benefits.

The following comments are offered on each individual agenda item.

2021-11BWG
Agenda item 2021-11BWG proposes to add a new annual statement supplement to the Property and Casualty annual statement to capture direct exposures written and direct exposures earned. In addition, the proposal would also require new quarterly reporting on Part 1 – Loss Experience to capture the number of direct earned exposures and Part 2 – Direct Premium Written to capture the number of direct written exposures. Both the annual statement proposed change and the proposed changes to the quarterly statement are focused on the private flood (Line 2.5), homeowners (Line 4), private passenger auto no-fault (Line 19.1), other private passenger liability (Line 19.2), and private passenger auto physical damage (Line 21.1) lines of business.

The stated justification for agenda item 2021-11BWG is to obtain average personal auto and homeowners’ premiums (as well as private flood) per exposure in a more-timely manner. The quarterly and annual statement should not be used to collect meaningless or incomplete data elements, as it runs the risk of misleading consumers and takes away from regulators core mission to educate consumers and efficiently regulate a competitive insurance marketplace. Because the annual reports produced by the NAIC that include average personal auto and homeowners’ premiums are typically published 24 months after the end of the experience period, some believe there is validity in obtaining this information sooner. However, there are significant flaws with how the proposal is constructed, including using exposure counts to calculate average premium. If the proposal is adopted as exposed, it will produce misleading results that instead of educating consumers on average premium values will have the opposite effect. The mission of insurance regulators is often to educate and protect consumers, rather than support proposals that provide inaccurate and misleading information and consumer confusion.

To the best of our knowledge, exposure counts are not required anywhere else in the annual or quarterly statement; however, exposure counts are required for certain direct state reporting filings, but those filings are at the policy level. The purpose of those filings is to provide policy level information to the Statistical Agency in order to illustrate the direct relationship between the premium being written and the exposures. Nevertheless, it is difficult to see what value the regulator would get with exposure counts, absent other significant data elements at the policy level, and the risk of misinterpretation by consumers far outweighs the benefits.
Therefore, in addition to capturing information that appears useless in the calculation of average premium values, there is a valid concern that the data will create false impressions and unintended consequences for all parties involved. Regulators should be aware that exposure counts are typically included as part of the rating filing. This information may already be in the possession of the regulator. Consequently, there is concern with exposing this proprietary data on annual statements especially if unnecessary. One must consider the regulatory purpose of requiring reporting entities to produce this information more than once, if at all. Further, it is imperative to consider why the request is only for a limited set of information. Absent other pertinent data elements, this information is meaningless in achieving the objective of obtaining average personal auto and homeowners’ premium per exposure.

NAMIC implores the working group to take a measured approach in arriving at conclusions on these action items in order to ascertain the benefit of requiring this information be provided with the costs in terms of regulatory compliance for both regulator and industry given the potential futility of outcome. NAMIC specifically requests that statistical data not be included on the annual/quarterly statement blanks and encourages the working group to instead look for opportunities to assist the NAIC in speeding up the process of publishing its’ annual report of average personal auto and homeowners’ premiums. Further, NAMIC encourages the working group to have ongoing conversations with industry to find a solution that is amenable, amendable, timely, and achieves the objective of protecting and educating the consumers we all serve.

2021-13BWG

Agenda Item 2021-13BWG proposes to add a new “Exhibit of Other Liabilities by Line of Business” that if adopted would require all reporting entities that report “other liability” on Line 17 of the Exhibit of Premiums and Losses to prepare this new exhibit annually. The stated purpose of the exhibit is to provide more information on the “diverse lines of business filed on Annual Statement Line 17” and includes 28 different liability lines of business requiring the reporting of the following direct business categories: written premium, earned premium, unearned premium reserve, losses paid, losses incurred, losses unpaid, defense and cost containment paid, DCC incurred, and DCC unpaid.

To implement this new exhibit would require significant changes to how insurers manage the business reported on Line 17, including systems updates to track the additional granularity required in the proposed reporting. While Other Liability encompasses a sizable portion of premiums written by property/casualty insurers, it remains unclear what regulatory purpose would be served by dividing this LOB into 28 sub-LOBs. NAMIC members request

---

2 Direct premiums written in 2020 for property/casualty insurers reporting on Line 17.1, 17.2 – Other Liability totaled $91 billion or 12.5% of total premiums written – NAIC 2020 Market Share Report.
additional time to comment on this proposal, as many of the new categories in the exhibit have not been defined, nor included in the Annual Statement Instructions.

Further, NAMIC members request the working group defer making any policy decision on whether to collect these data elements from all reporting entities until a cost/benefit study has been conducted. This study should factor in the cost of doing individual data calls as opposed to creating a new reporting supplement requirement for all reporting entities to comply with. As regulators consider their role in promoting a stable and competitive environment for consumers and insurers, top of mind should be how to balance what information from insurers is meaningful and relevant to the consumer but also would not put insurance companies at a competitive disadvantage. This issue strikes at the heart of that balance and requires a more deliberative process and additional time to consider. At very minimum, the regulators should take the necessary steps to protect consumers from misinformation and confusion.

* * * *

NAMIC appreciates the opportunity to take part in the process. Thank you for your consideration of these comments on this matter of importance to NAMIC, its member companies, and their policyholders. If there are any questions, please do not hesitate to contact me.

Sincerely,

Jonathan Rodgers
Director of Financial and Tax Policy
National Association of Mutual Insurance Companies

Comments of the Center for Economic Justice to the
NAIC Blanks Working Group and Casualty Actuarial and Statistical Task Force

Response to Comments on Blanks Proposal 2021-11BWG

July 12, 2021

CEJ offers the following responses to comments submitted on Blanks Proposal 2021-11BWG. The proposal would add earned exposure and written exposure data elements for the personal auto and homeowners lines of business to the annual and quarterly financial statements. For the annual statement, the reporting would be by-state in new exhibits that pull written premium and earned premium for the relevant lines of business from the Exhibit of Premiums and Losses (State Page). For the quarterly statements, earned exposures and written exposures would be added to Part 1 and Part 2, respectively.

We have already amended our proposal to remove the private flood line of business.

The benefits of the additions are significant, as set out in the proposal. Most important, with the additions, regulators and the public would be able to identify trends in exposures and average premium for the largest personal lines of property casualty insurance in a time frame to make this information useful.

CEJ has offered to work with interested parties to strengthen the proposal and address any shortcomings. No interested party has reached out to CEJ. Further, only one interested party has offered “suggestions” for improvements, but those “suggestions” were non-specific and were criticisms of the proposal incorrectly framed as “suggestions.”

CEJ organizes our response to the commenters by category of comment.

1. “Misleading data for regulators and the public.”

The most common objection among thecommenters is that the average written and earned premiums calculated from the proposed financial statement additions would be “misleading data for regulators and the public.” A representative comment comes from the interested parties:
“If ASL 4 Homeowners Exposures is all inclusive, the proposal to count written and earned ‘residences’ would include an array of policies ranging from rental policies to mansions, resulting in an average premium that has no real value to users. If ASL 4 Exposure does not include condo and/or rental policies, then the average premium would be misleadingly inflated.”

“For ASL 19.2 auto policies, if Premiums include, but Exposures exclude, miscellaneous vehicles, such as golf carts, private passenger trailers, and all-terrain vehicles, the average premium would be inflated. Furthermore, how misleading this broadly applied average may be for any individual company depends on the size and mix of their business reported under each ASL impacted by the proposal. This information, taken out of context, could be negatively construed and lead to detrimental results for companies.”

**The claim of “misleading” is without merit for several reasons.**

First, commenters point to the two statistical reports as providing information that is not misleading. Yet, the average premium that could be calculated from the proposed additions are the same average premium calculations found in the two statistical reports. It is unclear how the same average premium calculation can be simultaneously misleading and relevant information.

The proposed additions will permit the calculation of average homeowners premium by dividing premium by exposure. This is the same calculation found in the total column of Table 4 of that report, including a report by state and countrywide aggregate.1 While the report also provides average premium by homeowners policy form, the fact that an aggregate average premium is calculated and presented demonstrates that regulators who publish the report and industry who have never objected to this metric do not find aggregate average premium “misleading.”

The same response applies to the “misleading” claim for personal auto. The auto database report provides several average premium calculations. One is “average expenditure” which is the sum of liability, collision and comprehensive premium divided by liability written exposures. A second is combined average premium which is the sum of liability premium divided by liability written exposures, collision premium divided by collision written exposures and comprehensive premium divided by comprehensive written exposures.2

---

1 [https://content.naic.org/sites/default/files/publication-hmr-zu-homeowners-report.pdf](https://content.naic.org/sites/default/files/publication-hmr-zu-homeowners-report.pdf)
The proposed addition permits the exact same calculation of average expenditure as found in the auto database and a very similar calculation to the combined average premium calculation.

**Second, commenters seem to be complaining about the basic concept of an average.** Interested parties complain that any average premium calculation will be misleading because it combines different types of policies and different vehicles – “policies ranging from rental policies to mansions, resulting in an average premium that has no real value to users.”

By this logic, every average premium calculation found in the two statistical reports are “misleading.” For example, even within the average premium calculation by policy form in the homeowners statistical report, that average premium averages the premiums from small homes to mansions. The average premium calculations in the auto database average premiums for old and new vehicles for inexpensive vehicles and expensive vehicles and for different liability limits.

The nature of the average statistic is that it is a description of different outcomes. Consider some of the most highly-used statistics – average home prices, average family income or the unemployment rate. Each is a summary statistic of widely varying situations – the average of home prices for small, medium, large and massive homes in different locations, the average of income for different professions and family composition and the average of unemployment across different industries and markets. *Yet, these statistics are recognized as useful, despite these limitations, predominantly because they permit a timely analysis of changes over time. That is precisely what the proposed additions to the annual and quarterly statement will permit.*

**Third, while interested parties argue that the proposed additions will produce “misleading” average premium calculations, they ignore the fact that the current statistical reports produce misleading information.** The current statistical reports are misleading because they present average premium values that are two to three years old. In March 2021, the NAIC issued a press release and released the auto database report with average premium calculations for 2018. Some states – with low average premiums – issued press releases citing the report. We suggest it is far more misleading to release average premium data for 2018 in March 2021 than any of the concerns raised by interested parties with the blanks proposal. When someone reads that press release or references the average premium calculation in the two statistical reports, they will be misled into thinking that the data are somehow relevant and timely.
2. “Provide Competitors with Proprietary Information”

Interested parties offer the claim of “proprietary information” without evidence or explanation. Presumably, the claim of “proprietary information” is offered to suggest that if written and earned exposures were reported, reporting companies would suffer competitive harm – that, somehow, competitors could use the written and earned exposure data – by state on an annual basis and countrywide on a quarterly basis – to learn the competitor’s strategy.

Interested parties provide no evidence or even an explanation for this claim because it is an absurd claim. First, we know that the insurer achieving the fastest growth over the last decade – Progressive – provides the number of policies in force along with written and earned premium on a monthly basis – broken out not just for personal auto but by personal auto sold through agency versus direct channels. The fact that the fastest growing personal auto insurer – the one with the most to lose by providing “proprietary” information – voluntarily provides exposure counts on a monthly basis explodes the interested parties’ “proprietary” argument,

Second, it is unclear why or how any competitor would or could use this exposure information to gain some competitive advantage. Putting aside the fact that the quarterly exposure counts are countrywide and the annual counts are by state – aggregates too large to gain any meaningful insight for competitive purposes – insurers have access to many other data sources to gain far more timely and granular competitive insight. Insurers have real-time access to competitors’ rate filings as well as competitor quoting information, among other sources.

Third, the financial statements contain public information far more relevant and useful for competitors to ascertain another insurers’ business strategy. Consider the detailed reporting of loss reserves and changes in loss reserves by line of business. Using this information, a competitor could assess the loss reserving strategy of other insurers. Or consider the detailed reporting of investments – literally every stock and bond bought, held and sold. A competitor could use this information to assess the investment strategy of other insurers. Or consider the detailed reporting of every reinsurance agreements. A competitor could assess other insurers’ use of affiliated and unaffiliated reinsurance strategies. In contrast, the highly-aggregated exposure data cannot possibly provide the same types of insights.

3 https://ml.globenewswire.com/Resource/Download/5cef1e8f-b788-4e83-9daa-2f1cf5cd9d33
3. "Costs outweigh benefits"

Interested parties argue that benefits are lacking for 2021-11BWG and costs are significant. Again, interested parties’ claims are without evidence or support. Louisiana, for example, claims that “Expense to companies outweighs benefits,” “Require[s] companies to build a new system to capture and report exposure details,” and “Unless validated/audited will be of limited value.”

It is unclear why the costs of providing this information will be material to insurers and consumers. The new data elements – written exposures and earned exposures – are routinely captured in the course of insurers’ business, routinely used in insurers’ personal auto and residential property insurance rate filings and reported by many insurers in pay-for-public reports – Fast Track reports:

The Fast Track Monitoring System was developed to provide insurance professionals with a sampling of significant data by line of insurance at the earliest possible date. Participation in the Fast Track Monitoring System for Private Passenger Automobile involves the reporting of quarterly loss ratio data and claim cost and frequency data on an accelerated basis, so that it is received by the statistical agent within 45 days of the end of each quarter. The statistical agents collecting Fast Track data are Independent Statistical Service, Inc. (ISS), National Independent Statistical Service (NISS), and ISO Data, Inc.

For personal auto insurance, fast track data included earned exposures – “earned car years” and “earned house years” – for personal auto and homeowners, respectively.

Given the widespread use by insurers of these exposure metrics, it is unclear why “new systems to capture” the data would be required. While the data elements may need to be pulled from different data pools within an insurers’ overall information system, that is no different from other information reported in the annual and quarterly financial statements.

Further, the relevant cost metric for evaluation is the marginal cost of reporting additional data in the financial statements. We suggest that marginal cost is low in absolute terms and lower in relative terms to the many other changes and additions to the annual and quarterly statements that occur each year.

Let’s put the cost in perspective relative to premiums. According to data published by the NAIC, in 2020, there was $110 billion in homeowners (line 4) written premium and $249 billion in personal auto (lines 19.1, 19.2 and 21.1) written premium. Now let’s assume a preposterously large marginal cost for insurers of, say, $10 million to report the new data elements. That would represent less than 3/1000ths of a percent of premium – or less than 3

---

4 https://content.naic.org/sites/default/files/web_market_share_property_casualty.pdf

© 2021 National Association of Insurance Commissioners
cents for a policy with a $1,000 premium. Of course, the marginal cost of second and later years’ reporting would be far less than the initial reporting. So the cost per premium dollar would be much lower when considered over a multiple year period.

The benefits are significant and clearly outweigh any costs to insurers. First, the benefits to the proposal additions include more timely data that is clearly of interest to regulators and the public. While the two statistical reports have much useful information beyond average premium calculations, it is unclear what purpose is served by publishing average premium in these reports since the data are so old and not relevant for current analysis.

Imagine if insurers were to make rate filings in March 2021 with data only through year-end 2018. No regulator would accept such stale data. Or imagine that any of the other data in the annual statement were that stale – 2018 investments instead of 2020 investments reported in March 2021. The relevance of timely data is no less true for exposure counts and average premium.

Second, the most significant benefit for both financial and market analysis is the ability to track trends in exposures and average premium on a timely, quarterly basis. As with most indices or major averages, it is the analysis of changes over time that provide the most useful information. The proposed additions will create the opportunity for this type of timely analysis of changes over time.

Third, the proposal is, by far, the most efficient method of capturing this important information. Some commenters suggested that regulators have other means of collecting these data – from rate filings or special data calls. There is no existing, timely data collection of these data elements. Rate filings are not a comprehensive or uniform or timely source of the data since insurers do not routinely make complete rate filings on a quarterly basis or include the relevant information in every rate filing. Special data calls are far more expensive for insurers than routine ongoing reporting and are far less reliable for data quality. By adding the data elements to existing, routine reporting, the data will reported using the most efficient and common data reporting tools and provide comprehensive and uniform reporting.

Fourth, regulators, insurers and the public benefit with reporting of and publishing of current experience. As noted above, we believe it is far misleading to issue average premium data in March 2021 – which will likely be misinterpreted as current information – than any alleged problems with “averages.”

Fifth, the proposal provides new data elements that will make other information in the annual and quarterly statements more useful. For example, the availability of exposure counts offers new and improved opportunities to analyze changes in written and earned premiums.
Sixth, the proposal provides relevant information to interested stakeholders, including academics, policy-makers and other third parties who routinely publish “average premium” information. A major benefit of the proposal is the availability of relevant and timely public information from a respected source. Right now, there are a variety of websites that publish “average premium” values based on a variety of methodologies – none of which are as reliable as those available with the proposed financial statement additions.

In summary, the benefits of the proposed addition far outweigh the costs to insurers.

4. “Improve the timeliness of the current statistical reports instead.”

Some commenters suggested, as alternatives to the proposed financial statement additions, speeding up the production of the current statistical reports or issuing special data calls or culling information from existing sources. None of these suggested alternatives are a viable substitute for the proposed financial statement additions.

First, the proposal is not intended to replace the existing statistical reports because those reports have far more information than simply average premium. Most importantly, the statistical reports include claims information – and that is the source of the lengthy delay between the experience period and the publication of the reports. Simply stated, claims take time to develop, so matching claims to exposures requires time for the claims to be reported and settled.

In addition, the nature of the data collection for the statistical reports requires a far lengthier and complicated process than the proposed financial statement additions. To produce the statistical reports, the NAIC must gather data from several statistical agents and several individual states and then combine and audit those data. In contrast, the proposed financial statement additions involve direct reporting from insurers to the NAIC through an existing reporting document and, consequently, will always be much faster than the reporting and compilation associated with the statistical reports.

Second, as discussed above, there are no other timely sources of the data in a comprehensive and uniform manner. Rate filings cannot generate comprehensive and uniform data. Fast Track data is reported by only a portion of the industry and is not readily available to the public.

Third, as discussed above, special data calls are far more inefficient, costly and less reliable than routine financial statement reporting and don’t permit the critical use of timely analyzing trends in average premium over time. Insurers have long complained about the cost of special data calls, so when insurers argue against routine reporting of data through existing reporting instruments, we can be certain that the complaint is not about cost.
5. “Clearer definitions of exposure are needed.”

The Academy comments include the following as suggestions that would “improve the proposal.”

Include a complete and clear definition of exposure and calculation for each line proposed, particularly as respects the crossing (or overlap) of calendar time periods. Clear specifications ensure greater consistency across companies reporting; and Definitions that account or minimize distortions from mix would be recommended.

While we welcome the opportunity to improve the proposal, we cannot identify the problems alleged by the Academy. Of note is the fact that the Academy has not offered the proposed guidance it alleges that insurers seek. Comments for blanks proposals routinely offer the specific wording in the comments to implement the concepts they propose. But, not for this proposal.

The Academy argues that additional, clearer definitions are needed to address the fact that the homeowners lines contains different policy forms. Yet, it is unclear how any reporting company could misinterpret the proposed instruction which refer to either an insured vehicle or an insured property.

The proposed definitions are:

A Written Exposure for Annual Statement Line 4 is defined as a single residential property for which coverage was written at any time during the calendar reporting period and remained in force through the end of the calendar reporting year. If the coverage was written and cancelled within the calendar reporting year, the written exposure is the fraction of the year the coverage was in force.

A Written exposure for Annual Statement Lines 19.1, 19.2 and 21.1 is defined as single motor vehicle for which coverage was written at any time during the calendar reporting year and remained in force through the end of the calendar reporting year. If the coverage was written and cancelled within the calendar reporting year, the written exposure is the fraction of the year the coverage was in force.

An Earned Exposure for Annual Statement Line 4 is defined as the fraction of the calendar reporting year for which a single residential property had coverage in force.

An Earned Exposure for Annual Statement Lines 19.1, 19.2 and 21.2 is defined as the fraction of the calendar reporting year for which a single motor vehicle had coverage in force.
Given these definitions, the Academy “suggestions” make no sense. First, it is crystal clear how exposures should be calculated for each line of business – the definitions are industry standard for two of the most common metrics in insurance. The Academy’s complaint that homeowners include a variety of homeowners policy forms has no relevance for defining an exposure. Given the proposed instructions, it is unclear how an insurer could misinterpret an exposure for a renter’s policy form or a condo policy form. Similarly, it is unclear how an insurer could misinterpret an exposure for a motorcycle or a mobile home written on a personal auto policy form.

Similarly, the complaint / “suggestion” regarding “crossing (or overlap) of calendar time periods” is clearly addressed in the definitions. There are few concepts in property casualty insurance more widely used than written exposure and earned exposure. The difference between the two measures of exposure relates specifically to what portion of the exposure is counted within a calendar year. The proposed definitions directly address – with industry standards – how to measure exposures that may overlap reporting periods.

6. “The requested information is not solvency related and shouldn’t be in the AS and QS.”

This comment from Louisiana is deeply flawed in two major respects – the data do have relevance for financial oversight and the financial statements include much information that is not “solvency-related.”

We strongly believe that the addition of exposure elements to the annual and quarterly financial statements will assist financial analysts, as well as market analysts. The addition of exposure data permits financial analysts to better understand and assess changes in premium from one reporting period to the next. Change in quarterly premium written and earned can be better understood with related exposure counts – is the insurer’s premium change a result of changes in average premium per exposure or simply changes in exposure?

Further, the financial statements include a variety of information not related to insurer solvency, including, for example, the new private flood supplement, the credit insurance experience exhibit, the bail bond supplement and Schedule T Exhibit of Premiums Written. While not solvency related, these parts of annual statement reporting provide necessary information for regulators to carry out statutory responsibilities. These non-solvency exhibits and supplements in the financial statements because it is the most efficient and effective method of collecting comprehensive and uniform data from insurers to meet a specific regulatory purpose. That same rationale applies to the proposed 2021-11BWG.

Thank you for your consideration. We urge both CASTF and Blanks to support proposal 2021-11BWG.

Anticipated Effective Date: 1st Quarter Annual 2022

**IDENTIFICATION OF ITEM(S) TO CHANGE**

Add a new annual statement supplement to capture exposure data for Annual Statement Lines 2.5.4, 19.1, 19.2 and 21.2. Add a column to the Quarterly Parts 1 and 2 to capture exposure data for these annual statement lines for the quarter.

***See Next Page For More Details***

**REASON, JUSTIFICATION FOR AND/OR BENEFIT OF CHANGE**

***See Next Page For Details***

**NAIC STAFF COMMENTS**

Comment on Effective Reporting Date: ____________________________________________

Other Comments:

** This section must be completed on all forms.
IDENTIFICATION OF ITEM(S) TO CHANGE

Add a new annual statement supplement to the Property and Casualty annual statement to capture “Direct Exposures Written” and “Direct Exposures Earned” which will be reported, initially only for Annual Statement Lines 2.5 (Private Flood), 4 (Homeowners), 19.1 (PPA No Fault), 19.2 (PPA Liability) and 21.1 (PPA Physical Damage).

Add one column to property casualty quarterly statement Part 1 Loss experience between current columns 1 and 2 for “Direct Exposures Earned” only for only for Lines 2.5 (Private Flood), 4 (Homeowners), 19.1 (PPA No Fault), 19.2 (PPA Liability) and 21.1 (PPA Physical Damage).

Add one column to property casualty quarterly statement Part 2 Direct Premium Written between current columns 1 and 2 for “Direct Exposures Written” only for only for Lines 2.5 (Private Flood), 4 (Homeowners), 19.1 (PPA No Fault), 19.2 (PPA Liability) and 21.1 (PPA Physical Damage).

Add instructions for reporting the additional data elements, consisting of definitions and examples for the new data elements.

REASON, JUSTIFICATION FOR AND/OR BENEFIT OF CHANGE**

The average written and average earned premium per exposure is an important metric for a variety of regulatory and public policy purposes. The NAIC annually produces reports of average personal auto and homeowners premiums, but the data in these reports are old and stale for timely assessment of absolute average premium and changes in average premium over time. Both reports are typically produced 24 months after the end of the experience period and 36 months after the beginning of the experience period. Homeowners average premiums for 2018 was published in January 2021 in the “Dwelling Fire, Homeowners Owner-Occupied, and Homeowners Tenant and Condominium/Cooperative Unit Owners’ Insurance Report: Data for 2018.” Personal auto average premiums for 2018 was published in March 2021 in the “Auto Database Report.” While there are valid reasons for the length of time needed to produce these reports – primarily because these reports contain information beyond average premium – the average premium numbers lose significant relevance because of their age.

This AS and QS Blanks proposals would allow the calculation of average written and average earned premium for residential property and personal auto coverages in a far more timely fashion – within three to four months following the reporting year instead of 24 months and would provide timely and useful quarterly information. The benefits of timelier average premium data are considerable. Timely average premium data would permit financial analysts to utilize changes in average premium as part of financial analysis. Similarly, the more-timely average premium data would become a valuable tool for market regulation analysts, including, but not limited to, an added data point for use with the Market Conduct Annual Statement. Last, but not least, this proposal would allow the NAIC to calculate and publish average annual premium data for residential property and personal auto insurance by state in a time frame to both make the data meaningful for describing market conditions and to inform individual state regulators and policymakers of actual changes in personal lines average premiums – as opposed to expected changes gleaned from rate filings.

Consider how valuable timely average premium values would have been for personal lines as the pandemic unfolded. Consider also the value of quarterly data for average premium for personal lines versus only an annual average. The lack of timeliness of the average premium values means that these data have very limited or no use for either financial or market analysis. The lack of timeliness also means that the data are no use in informing public policy debates about personal lines insurance costs. In addition, the severe time lag between actual experience and reporting fails to inform the public or policymakers of recent trends or outcomes and can, consequently, mislead the public and policymakers.
ANNUAL STATEMENT INSTRUCTIONS – PROPERTY

DIRECT PREMIUM AND EXPOSURES
Annual Statement Lines 2.5, 4, 19.1, 19.2 and 21.1
Allocated by States and Territories

This supplement must be filed with the NAIC by March 1 each year.

This supplement should be completed by those reporting entities that write direct business reported on the Exhibit of Premiums and Losses for each Annual Statement Lines (ASL) listed below. A separate page will be completed for each ASL.

<table>
<thead>
<tr>
<th>ASL 2.5 (Private Flood)</th>
</tr>
</thead>
<tbody>
<tr>
<td>ASL 4 (Homeowners)</td>
</tr>
<tr>
<td>- Excluding Renters, Condominiums and Co-ops</td>
</tr>
<tr>
<td>- Renters, Condominiums and Co-ops</td>
</tr>
<tr>
<td>ASL 19.1 (Private Passenger Auto No-Fault – Personal Injury Protection)</td>
</tr>
<tr>
<td>ASL 19.2 (Other Private Passenger Auto Liability)</td>
</tr>
<tr>
<td>ASL 21.1 (Private Passenger Auto Physical Damage)</td>
</tr>
</tbody>
</table>

Column 1 – Direct Premiums Written

The amounts reported for each line should agree with the amounts reported for the corresponding Annual Statement Line in Column 1, Line 35 of the Exhibit of Premiums and Losses for that state.

| Line 59 (Part 1 plus Part 2) should equal Line 4, Column 1, Line 35 of the Exhibit of Premiums and Losses (GT Page) |
| Line 59 (Part 3) should equal Line 19.1, Column 1, Line 35 of the Exhibit of Premiums and Losses (GT Page) |
| Line 59 (Part 4) should equal Line 19.2, Column 1, Line 35 of the Exhibit of Premiums and Losses (GT Page) |
| Line 59 (Part 5) should equal Line 21.1, Column 1, Line 35 of the Exhibit of Premiums and Losses (GT Page) |

Column 2 – Direct Written Exposures

A Written Exposure for Annual Statement Lines 2.5 and 4 is defined as a single residential property for which coverage was written at any time during the calendar reporting period and remained in force through the end of the calendar reporting year. If the coverage was written and cancelled within the calendar reporting year, the written exposure is the fraction of the year the coverage was in force.

A Written exposure for Annual Statement Lines 19.1, 19.2 and 21.1 is defined as single motor vehicle for which coverage was written at any time during the calendar reporting year and remained in force through the end of the calendar reporting year. If the coverage was written and cancelled within the calendar reporting year, the written exposure is the fraction of the year the coverage was in force.
Examples. Assume a homeowners policy is written on July 1 during the reporting year and remains in force through the end of the reporting year. This activity would be reported as one (1.0) written exposure.

Assume a private passenger policy with No-Fault, Liability and Physical Damage coverages was written on April 1 and cancelled by the insured on July 1. This activity would be reported as 0.25 written exposure.

Column 3 – Direct Premiums Earned

The amounts reported for each line should agree with the amounts reported for the corresponding Annual Statement Line in Column 2, Line 35 of the Exhibit of Premiums and Losses for each state.

| Line 59 (Part 1 plus Part 2) should equal Line 4, Column 2, Line 35 of the Exhibit of Premiums and Losses (GT Page) |
| Line 59 (Part 3) should equal Line 19.1, Column 2, Line 35 of the Exhibit of Premiums and Losses (GT Page) |
| Line 59 (Part 4) should equal Line 19.2, Column 2, Line 35 of the Exhibit of Premiums and Losses (GT Page) |
| Line 59 (Part 5) should equal Line 21.1, Column 2, Line 35 of the Exhibit of Premiums and Losses (GT Page) |

Column 4 – Direct Earned Exposures

An Earned Exposure for Annual Statement Lines 2.5 and 4 is defined as the fraction of the calendar reporting year for which a single residential property had coverage in force.

An Earned Exposure for Annual Statement Lines 19.1, 19.2 and 21.2 is defined as the fraction of the calendar reporting year for which a single motor vehicle had coverage in force.

Examples. Assume a homeowners policy is written on July 1 during the reporting year and remains in force through the end of the reporting year. This activity would be reported as 0.5 earned exposure.

Assume a private passenger policy with No-Fault, Liability and Physical Damage coverages was written on April 1 and cancelled by the insured on July 1. This activity would be reported as 0.25 earned exposure.
QUARTERLY STATEMENT INSTRUCTIONS – PROPERTY

PART 1 – LOSS EXPERIENCE

Column 1 – Direct Premiums Earned

Display direct premiums earned by line of business. The total must agree with the Statement of Income Page 4, Direct Premiums Earned Line 1.1, Column 1.

Column 2 – Direct Earned Exposures

An Earned Exposure for Annual Statement Lines 2.5 and 4 is defined as the fraction of the calendar reporting year for which a single residential property had coverage in force.

An Earned Exposure for Annual Statement Lines 19.1, 19.2 and 21.2 is defined as the fraction of the calendar reporting year for which a single motor vehicle had coverage in force.

Examples. Assume a homeowners policy is written on July 1 during the reporting year and remains in force through the end of the reporting year. This activity would be reported as 0.5 earned exposure.

Assume a private passenger policy with No-Fault, Liability and Physical Damage coverages was written on April 1 and cancelled by the insured on July 1. This activity would be reported as 0.25 earned exposure.

Column 23 – Direct Losses Incurred

Display direct losses incurred by line of business. The total must agree with the Statement of Income Page 4, Direct Losses Incurred Line 2.1, Column 1.

Column 24 – Direct Loss Percentage

Column 23 (Direct Losses Incurred)/Column 1 (Direct Premiums Earned) multiplied by 100.

Column 45 – Prior Year to Date Direct Loss Percentage

Display year-to-date direct loss percentages by line of business for the same quarter of the prior year.

Line 30 – Warranty

Data for this line should be reported prospectively (i.e., Prior year amounts need not be restated) starting with the 2008 reporting year.
PART 2 – DIRECT PREMIUMS WRITTEN

### SUPPLEMENTAL EXHIBITS AND SCHEDULES INTERROGATORIES

The following supplemental reports are required to be filed as part of your statement filing unless specifically waived by the domiciliary state. However, in the event that your domiciliary state waives the filing requirement, your response of WAIVED to the specific interrogatory will be accepted in lieu of filing a "NONE" report and a bar code will be printed below. If the supplement is required of your company but is not being filed for whatever reason, enter SEE EXPLANATION and provide an explanation following the interrogatory questions.

#### MARCH FILING

<table>
<thead>
<tr>
<th>Interrogatory</th>
<th>RESPONSES</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Will an actuarial opinion be filed by March 1?</td>
<td></td>
</tr>
<tr>
<td>2. Will the Supplemental Compensation Exhibit be filed with the state of domicile by March 1?</td>
<td></td>
</tr>
<tr>
<td>3. Will the confidential Risk-based Capital Report be filed with the NAIC by March 1?</td>
<td></td>
</tr>
<tr>
<td>4. Will the confidential Risk-based Capital Report be filed with the state of domicile, if required, by March 1?</td>
<td></td>
</tr>
</tbody>
</table>

#### APRIL FILING

<table>
<thead>
<tr>
<th>Interrogatory</th>
<th>RESPONSES</th>
</tr>
</thead>
<tbody>
<tr>
<td>5. Will the Insurance Expense Exhibit be filed with the state of domicile and the NAIC by April 1?</td>
<td></td>
</tr>
<tr>
<td>6. Will the Management’s Discussion and Analysis be filed by April 1?</td>
<td></td>
</tr>
<tr>
<td>7. Will the Supplemental Investment Risks Interrogatories be filed by April 1?</td>
<td></td>
</tr>
</tbody>
</table>

#### MAY FILING

<table>
<thead>
<tr>
<th>Interrogatory</th>
<th>RESPONSES</th>
</tr>
</thead>
<tbody>
<tr>
<td>8. Will this company be included in a combined annual statement that is filed with the NAIC by May 1?</td>
<td></td>
</tr>
</tbody>
</table>

#### JUNE FILING

<table>
<thead>
<tr>
<th>Interrogatory</th>
<th>RESPONSES</th>
</tr>
</thead>
<tbody>
<tr>
<td>9. Will an audited financial report be filed by June 1?</td>
<td></td>
</tr>
<tr>
<td>10. Will the Supplemental Compensation Exhibit be filed with the state of domicile by March 1?</td>
<td></td>
</tr>
</tbody>
</table>

The following supplemental reports are required to be filed as part of your statement filing if your company is engaged in the type of business covered by the supplement. However, in the event that your company does not transact the type of business for which the special report must be filed, your response of NO to the specific interrogatory will be accepted in lieu of filing a "NONE" report and a bar code will be printed below. If the supplement is required of your company but is not being filed for whatever reason, enter SEE EXPLANATION and provide an explanation following the interrogatory questions.

#### MARCH FILING

<table>
<thead>
<tr>
<th>Interrogatory</th>
<th>RESPONSES</th>
</tr>
</thead>
<tbody>
<tr>
<td>11. Will Schedule 54 (Stockholder Information Supplement) be filed with the state of domicile by March 1?</td>
<td></td>

1. Exposed the Referrals from Blanks (E) Working Group

Mr. Vigliaturo said the Blanks (E) Working Group sent the Task Force two referrals (Attachment Two-A).

Birny Birnbaurm (Center for Economic Justice—CEJ) described his proposal, 2021-11BWG; its purpose; and its benefits. He said his proposal would add a new annual statement supplement to capture exposure data for specific lines of business and add a column to the Quarterly Part 1 and Part 2 to capture exposure data for the same lines of business. He stated the Task Force’s Auto Insurance Database Report and Dwelling Fire, Homeowners Owner-Occupied, and Homeowners Tenant and Condominium/Cooperative Unit Owner’s Insurance Report (Homeowners Report) include similar information but are published so late that its data is old. He asked the Task Force to provide suggestions for improvement to the proposal, support the proposal, and support implementation for annual statement 2021 reporting. Mr. Birnbaurm said the reporting should not be difficult for companies or cost much.

Mr. Stolyarov said he supports the proposal to gain insights earlier. Mr. Jacobson said the definition of “exposure” may vary across different parties. Mr. Chou said homeowner averages are affected by the distribution of companies’ issued owners or others forms. Typical contract types and average premiums would not be comparable from one company to another. He also asked whether the Best’s Aggregate & Averages could be used instead of this proposal. Mr. Conley asked about the exposure definition for auto physical damage. Mr. Birnbaurm verified that if an auto had comprehensive and collision coverage, one exposure would be reported; if it only had comprehensive coverage, the number of exposures would still be one. Mr. Schwartz said there are issues with the requested data not being homogeneous to produce useable information. Mr. McKenney said reporting on the new flood insurance supplement was fraught with errors and that he feared similar reporting issues with this proposal because it would need to be verified by someone. Mr. Birnbaurm said this proposal should be easier for companies to complete accurately because it flows with information already reported. Mr. Will Davis said from a solvency perspective, he does not believe having this data in the annual statement would be useful. He said he can obtain information from the actuarial report and other sources already. He said the state can issue a data call if there is need for market information. Ralph Blanchard (Travelers) expressed concerns about the timing and accuracy and said that if the proposal passes, the reporting should be delayed until 2023. He said statistical information should not be in the annual statement. Mr. Birnbaurm said the averages resulting from this reporting would be similar to what is produced by the Statistical Data (C) Working Group when it reports average home insurance or auto insurance premium by state.

Mr. Chou made a motion, seconded by Mr. Piazza, to exposed proposal 2021-11BWG for a 30-day public comment period ending July 7, 2021.
Mr. Vigliaturo said the second proposal referred to the Task Force, 2021-13BWG, would add an exhibit to provide more granular detail for the diverse lines of business reported as “other liability.” He said this proposal from a New Hampshire state insurance regulator would not affect any of the Task Force’s statistical reports. Mr. Schwartz asked how the data would be used. He said he is interested in adding another line to report liability for foster parents. Mr. Slavich said the proposal would capture most data required to be reported in an annual data call for Washington. He said he would like to see the report expanded in a couple of places. Mr. Blanchard said the biggest issue is that asking for incurred but not reported (IBNR) reserves at the proposed level of detail is problematic. He suggested a focus on case reserves instead.

Mr. Piazza made a motion, seconded by Mr. Slavich, to expose proposal 2021-13BWG for a 30-day public comment period ending July 7, 2021.

Having no further business, the Casualty Actuarial and Statistical (C) Task Force adjourned.

RE: 2021-11BWG – New Supplement to Detail Direct Exposures Written and Earned
2021-13BWG – Exhibit of Other Liabilities by Lines of Business

The Blanks (E) Working Group exposed two proposals at its May 26 meeting. Interested parties asked that the proposals be concurrently referred to the Casualty Actuarial and Statistical (C) Task Force for comment. Some concerns expressed by interested parties were in the reporting breakout level of exposures in proposal 2021-11BWG, indicating that there are mid-term cancellations and additions as well as multi-auto policies, which may be difficult to record. Interested parties also indicated that the additional breakout in proposal 2021-13BWG could affect the accuracy of the incurred but not reported amounts. The Working Group would like the Task Force to review the proposals and evaluate any issues that may affect the work of the Task Force, as well as comment on the interested parties’ concerns.

In proposal 2021-11BWG, the sponsor requests the addition of a new Property and Casualty annual statement supplement to capture “Direct Exposures Written” and “Direct Exposures Earned,” which will be reported initially only for annual statement line 2.5 (Private Flood), line 4 (Homeowners), line 19.1 (PPA No Fault), line 19.2 (PPA Liability) and line 21.1 (PPA Physical Damage). The sponsor requests a first quarter 2022 effective date.

In proposal 2021-13BWG, the sponsor requests the addition of a new supplement to capture premium and loss data on a more granular level for annual statement line 17.1, line 17.2 and line 17.3 of the Exhibit of Premiums and Losses (State Page) – Other Liability. The purpose of this proposal is to provide state insurance regulators greater detail of the premium and losses of these diverse lines of business. The sponsor requests an annual 2022 effective date.

To facilitate the sponsors’ effective dates and the Blanks (E) Working Group time frame, NAIC staff request that comments be provided by June 25 to Mary Caswell (NAIC) at mcaswell@naic.org.

**NAIC STAFF COMMENTS**

Comment on Effective Reporting Date: _____________________________________________

Other Comments: ________________________________________________________________

** This section must be completed on all forms.  Revised 7/18/2018
IDENTIFICATION OF ITEM(S) TO CHANGE

Add a new annual statement supplement to the Property and Casualty annual statement to capture “Direct Exposures Written” and “Direct Exposures Earned” which will be reported, initially only for Annual Statement Lines 2.5 (Private Flood), 4 (Homeowners), 19.1 (PPA No Fault), 19.2 (PPA Liability) and 21.1 (PPA Physical Damage).

Add one column to property casualty quarterly statement Part 1 Loss experience between current columns 1 and 2 for “Direct Exposures Earned” only for only for lines 2.5 (Private Flood) 4 (Homeowners), 19.1 (PPA No Fault), 19.2 (PPA Liability) and 21.1 (PPA Physical Damage).

Add one column to property casualty quarterly statement Part 2 Direct Premium Written between current columns 1 and 2 for “Direct Exposures Written” only for only for lines 2.5 (Private Flood) 4 (Homeowners), 19.1 (PPA No Fault), 19.2 (PPA Liability) and 21.1 (PPA Physical Damage).

Add instructions for reporting the additional data elements, consisting of definitions and examples for the new data elements.

REASON, JUSTIFICATION FOR AND/OR BENEFIT OF CHANGE**

The average written and average earned premium per exposure is an important metric for a variety of regulatory and public policy purposes. The NAIC annually produces reports of average personal auto and homeowners premiums, but the data in these reports are old and stale for timely assessment of absolute average premium and changes in average premium over time. Both reports are typically produced 24 months after the end of the experience period and 36 months after the beginning of the experience period. Homeowners average premiums for 2018 was published in January 2021 in the “Dwelling Fire, Homeowners Owner-Occupied, and Homeowners Tenant and Condominium/Cooperative Unit Owners’ Insurance Report: Data for 2018.” Personal auto average premiums for 2018 was published in March 2021 in the “Auto Database Report.” While there are valid reasons for the length of time needed to produce these reports – primarily because these reports contain information beyond average premium – the average premium numbers lose significant relevance because of their age.

This AS and QS Blanks proposals would allow the calculation of average written and average earned premium for residential property and personal auto coverages in a far more timely fashion – within three to four months following the reporting year instead of 24 months and would provide timely and useful quarterly information. The benefits of timelier average premium data are considerable. Timely average premium data would permit financial analysts to utilize changes in average premium as part of financial analysis. Similarly, the more-timely average premium data would become a valuable tool for market regulation analysts, including, but not limited to, an added data point for use with the Market Conduct Annual Statement. Last, but not least, this proposal would allow the NAIC to calculate and publish average annual premium data for residential property and personal auto insurance by state in a time frame to both make the data meaningful for describing market conditions and to inform individual state regulators and policymakers of actual changes in personal lines average premiums – as opposed to expected changes gleaned from rate filings.

Consider how valuable timely average premium values would have been for personal lines as the pandemic unfolded. Consider also the value of quarterly data for average premium for personal lines versus only an annual average. The lack of timeliness of the average premium values means that these data have very limited or no use for either financial or market analysis. The lack of timeliness also means that the data are no use in informing public policy debates about personal lines insurance costs. In addition, the severe time lag between actual experience and reporting fails to inform the public or policymakers of recent trends or outcomes and can, consequently, mislead the public and policymakers.

ANNUAL STATEMENT INSTRUCTIONS – PROPERTY

DIRECT PREMIUM AND EXPOSURES
Annual Statement Lines 2.5, 4, 19.1, 19.2 and 21.1
Allocated by States and Territories

This supplement must be filed with the NAIC by March 1 each year.

This supplement should be completed by those reporting entities that write direct business reported on the Exhibit of Premiums and Losses for each Annual Statement Lines (ASL) listed below. A separate page will be completed for each ASL.

ASL 2.5 (Private Flood)
ASL 4 (Homeowners)
ASL 19.1 (Private Passenger Auto No-Fault – Personal Injury Protection)
ASL 19.2 (Other Private Passenger Auto Liability)
ASL 21.1 (Private Passenger Auto Physical Damage)

Column 1 – Direct Premiums Written

The amounts reported for each line should agree with the amounts reported for the corresponding Annual Statement Line in Column 1, Line 35 of the Exhibit of Premiums and Losses for that state.

Column 2 – Direct Written Exposures

A Written Exposure for Annual Statement Lines 2.5 and 4 is defined as a single residential property for which coverage was written at any time during the calendar reporting period and remained in force through the end of the calendar reporting year. If the coverage was written and cancelled within the calendar reporting year, the written exposure is the fraction of the year the coverage was in force.

A Written exposure for Annual Statement Lines 19.1, 19.2 and 21.1 is defined as single motor vehicle for which coverage was written at any time during the calendar reporting year and remained in force through the end of the calendar reporting year. If the coverage was written and cancelled within the calendar reporting year, the written exposure is the fraction of the year the coverage was in force.

Examples. Assume a homeowners policy is written on July 1 during the reporting year and remains in force through the end of the reporting year. This activity would be reported as one (1.0) written exposure.

Assume a private passenger policy with No-Fault, Liability and Physical Damage coverages was written on April 1 and cancelled by the insured on July 1. This activity would be reported as 0.25 written exposure.
Column 3 – Direct Premiums Earned

The amounts reported for each line should agree with the amounts reported for the corresponding Annual Statement Line in Column 2, Line 35 of the Exhibit of Premiums and Losses for each state.

Column 4 – Direct Earned Exposures

An Earned Exposure for Annual Statement Lines 2.5 and 4 is defined as the fraction of the calendar reporting year for which a single residential property had coverage in force.

An Earned Exposure for Annual Statement Lines 19.1, 19.2 and 21.2 is defined as the fraction of the calendar reporting year for which a single motor vehicle had coverage in force.

Examples. Assume a homeowners policy is written on July 1 during the reporting year and remains in force through the end of the reporting year. This activity would be reported as 0.5 earned exposure.

Assume a private passenger policy with No-Fault, Liability and Physical Damage coverages was written on April 1 and cancelled by the insured on July 1. This activity would be reported as 0.25 earned exposure.
QUARTERLY STATEMENT INSTRUCTIONS – PROPERTY

PART 1 – LOSS EXPERIENCE

Column 1 – Direct Premiums Earned
Display direct premiums earned by line of business. The total must agree with the Statement of Income Page 4, Direct Premiums Earned Line 1.1, Column 1.

Column 2 – Direct Earned Exposures
An Earned Exposure for Annual Statement Lines 2.5 and 4 is defined as the fraction of the calendar reporting year for which a single residential property had coverage in force.

An Earned Exposure for Annual Statement Lines 19.1, 19.2 and 21.2 is defined as the fraction of the calendar reporting year for which a single motor vehicle had coverage in force.

Examples. Assume a homeowners policy is written on July 1 during the reporting year and remains in force through the end of the reporting year. This activity would be reported as 0.5 earned exposure.

Assume a private passenger policy with No-Fault, Liability and Physical Damage coverages was written on April 1 and cancelled by the insured on July 1. This activity would be reported as 0.25 earned exposure.

Column 23 – Direct Losses Incurred
Display direct losses incurred by line of business. The total must agree with the Statement of Income Page 4, Direct Losses Incurred Line 2.1, Column 1.

Column 34 – Direct Loss Percentage
Column 23 (Direct Losses Incurred)/Column 1 (Direct Premiums Earned) multiplied by 100.

Column 45 – Prior Year to Date Direct Loss Percentage
Display year-to-date direct loss percentages by line of business for the same quarter of the prior year.

Line 30 – Warranty
Data for this line should be reported prospectively (i.e., Prior year amounts need not be restated) starting with the 2008 reporting year.
PART 2 – DIRECT PREMIUMS WRITTEN

Column 1  –  Current Quarter

Display current quarter direct premiums written by line of business.

Column 2  –  Direct Written Exposures

A Written Exposure for Annual Statement Lines 2.5 and 4 is defined as a single residential property for which coverage was written at any time during the calendar reporting period and remained in force through the end of the calendar reporting year. If the coverage was written and cancelled within the calendar reporting year, the written exposure is the fraction of the year the coverage was in force.

A Written exposure for Annual Statement Lines 19.1, 19.2 and 21.1 is defined as single motor vehicle for which coverage was written at any time during the calendar reporting year and remained in force through the end of the calendar reporting year. If the coverage was written and cancelled within the calendar reporting year, the written exposure is the fraction of the year the coverage was in force.

Examples. Assume a homeowners policy is written on July 1 during the reporting year and remains in force through the end of the reporting year. This activity would be reported as one (1.0) written exposure.

Assume a private passenger policy with No-Fault, Liability and Physical Damage coverages was written on April 1 and cancelled by the insured on July 1. This activity would be reported as 0.25 written exposure.

Column 23  –  Current Year to Date

Display year-to-date direct premiums written.

Column 34  –  Prior Year, Year to Date

Display year-to-date direct premiums written from the same quarter of the prior year.

Line 30  –  Warranty

Data for this line should be reported prospectively (i.e., Prior year amounts need not be restated) starting with the 2008 reporting year.

## SUPPLEMENTAL EXHIBITS AND SCHEDULES INTERROGATORIES

The following supplemental reports are required to be filed as part of your statement filing unless specifically waived by the domiciliary state. However, in the event that your domiciliary state waives the filing requirement, your response of WAIVED to the specific interrogatory will be accepted in lieu of filing a "NONE" report and a bar code will be printed below. If the supplement is required of your company but is not being filed for whatever reason, enter SEE EXPLANATION and provide an explanation following the interrogatory questions.

### MARCH FILING

<table>
<thead>
<tr>
<th>No.</th>
<th>Interrogatory</th>
<th>Response</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Will an actuarial opinion be filed by March 1?</td>
<td>……………………</td>
</tr>
<tr>
<td>2.</td>
<td>Will the Supplemental Compensation Exhibit be filed with the state of domicile by March 1?</td>
<td>……………………</td>
</tr>
<tr>
<td>3.</td>
<td>Will the confidential Risk-based Capital Report be filed with the MAIC by March 1?</td>
<td>……………………</td>
</tr>
<tr>
<td>4.</td>
<td>Will the confidential Risk-based Capital Report be filed with the state of domicile, if required, by March 1?</td>
<td>……………………</td>
</tr>
</tbody>
</table>

### APRIL FILING

<table>
<thead>
<tr>
<th>No.</th>

IDENTIFICATION OF ITEM(S) TO CHANGE

Add a new supplement to capture premium and loss data for Annual Statement Lines 17.1, 17.2 & 17.3 of the Exhibit of Premiums and Losses (State Page) – Other Liability by more granular lines of business.

REASON, JUSTIFICATION FOR AND/OR BENEFIT OF CHANGE**

The purpose of this proposal is to provide regulators more granular detail of the premium and losses of the diverse lines of business reported on Annual Statement Lines 17.1, 17.2 & 17.3 of the Exhibit of Premiums and Losses (State Page).

NAIC STAFF COMMENTS

Comment on Effective Reporting Date: 

Other Comments:

** This section must be completed on all forms.
ANNUAL STATEMENT INSTRUCTIONS – PROPERTY

Exhibit of Other Liabilities by Lines of Business
As Reported on Line 17 of The Exhibit of Premiums and Losses

All reporting entities reporting “Other Liability” on Line 17 of the Exhibit of Premiums and Losses must prepare this exhibit. The exhibit is to be prepared and filed by all reporting entities no later than March 1 of each year.

The purpose of the Exhibit of Other Liabilities by Lines of Business is to provide more information on the diverse lines of business filed on Annual Statement Line 17. The exhibit should be reported on a direct basis (before assumed and ceded reinsurance).

For definitions of the products reported on Lines 1 through 28, see the appendix of these instructions. Line 26 – All Other will include all products not reported on Lines 1 through 28.

Column 1 – Written Premium

Line 30 should equal Exhibit of Premiums and Losses Grand Total Page Column 1, Line 17.1 + Line 17.2 + Line 17.3.

Column 2 – Earned Premium

Line 30 should equal Exhibit of Premiums and Losses Grand Total Page Column 2, Line 17.1 + Line 17.2 + Line 17.3.

Column 3 – Unearned Premium Reserve

Line 30 should equal Exhibit of Premiums and Losses Grand Total Page Column 4, Line 17.1 + Line 17.2 + Line 17.3.

Column 4 – Losses Paid (Deducting Salvage)

Line 30 should equal Exhibit of Premiums and Losses Grand Total Page Column 5, Line 17.1 + Line 17.2 + Line 17.3.

Column 5 – Losses Incurred

Line 30 should equal Exhibit of Premiums and Losses Grand Total Page Column 6, Line 17.1 + Line 17.2 + Line 17.3.

Column 6 – Losses Unpaid

Line 30 should equal Exhibit of Premiums and Losses Grand Total Page Column 7, Line 17.1 + Line 17.2 + Line 17.3.

Column 7 – Defense and Cost Containment Paid

Line 30 should equal Exhibit of Premiums and Losses Grand Total Page Column 8, Line 17.1 + Line 17.2 + Line 17.3.

Column 8 – Defense and Cost Containment Incurred

Line 30 should equal Exhibit of Premiums and Losses Grand Total Page Column 9, Line 17.1 + Line 17.2 + Line 17.3.

Column 9 – Defense and Cost Containment Unpaid

Line 30 should equal Exhibit of Premiums and Losses Grand Total Page Column 10, Line 17.1 + Line 17.2 + Line 17.3.
## Exhibit of Other Liabilities by Lines of Business

**As Reported on Line 17 of the Exhibit of Premiums and Losses**

*(To Be Filed by March 1)*

### Direct Business Only

**NAIC Proceedings – Summer 2021**

Attachment Two-A

Casualty Actuarial and Statistical (C) Task Force
The Casualty Actuarial and Statistical (C) Task Force met May 11, 2021. The following Task Force members participated: Grace Arnold, Chair, represented by Phil Vigliaturo (MN); James J. Donelon, Vice Chair, represented by Rich Piazza (LA); Lori K. Wing-Heier represented by Katie Hegland (AK); Jim L. Ridling represented by Daniel Davis (AL); Evan G. Daniels represented by Vanessa Darrah and Tom Zuppan (AZ); Michael Conway represented by Mitchell Bronson and Sydney Sloan (CO); Andrew N. Mais represented by George Bradner, Wanchin Chou and Qing He (CT); Karima A. Woods represented by David Christhilf (DC); Colin M. Hayashida represented by Randy Jacobson (HI); Doug Ommen, Travis Grassel and Andria Seip (IA); Dana Popish Severinghaus represented by Anthony Brodel and Reid McClintock (IL); Vicki Schmidt represented by Nicole Boyd (KS); Kathleen A. Birnane represented by Ron Coleman (MD); Eric A. Cioppa represented by Sandra Darby (ME); Anita G. Fox represented by Kevin Dyke (MI); Chlora Lindley-Myers represented by Cynthia Amann and LeAnn Cox (MO); Troy Downing represented by Mari Kindberg (MT); Mike Causey represented by Kevin Conley and Arthur Schwartz (NC); Chris Nicolopoulos represented by Christian Citarella (NH); Russell Toal represented by Anna Krylova (NM); Judith L. French represented by Tom Botsko (OH); Glen Mulready represented by Andrew Schallhorn (OK); Jessica K. Altman represented by Michael McKenney (PA); Raymond G. Farmer represented by Karl Bitzky (SC); Doug Slape represented by J’ne Byckovski, Miriam Fisk, Eric Hintikka and Bethany Sims (TX); Michael S. Pecjak represented by Rosemary Raszka (VT); Mike Kreidler represented by Eric Slavich (WA); and Jeff Rude represented by Donna Stewart (WY). Also participating was: Halina Smosna (NY).

1. **Discussed the CAS’S Recission of the SOP**

Mr. Vigliaturo said there has been a development at the Casualty Actuarial Society (CAS) regarding its recission of the Statement of Principles (SOP). Jessica Leong (CAS) said the CAS Board decided to reinstate the “Statement of Principles Regarding Property and Casualty Insurance Ratemaking” as it relates to U.S. regulated ratemaking.

Many Task Force members and interested parties expressed contentment with this action and do not desire to move forward with any further action. Mr. Schwartz said there was consideration by members of the Society of Actuaries (SOA) in the 1980s of copying the document for life and health insurance; he encouraged that action to be taken. Gennady Stolyarov (NV) issued a written statement, saying the immediate need for action is resolved. In the longer term, Mr. Schwartz said he is supportive of the NAIC adopting a similar statement of principles that would not be subject to the unilateral decisions of a private organization. Mr. Bradner said he would not support the NAIC having a competing document with the CAS principles. J. Robert Hunter (Consumer Federation of America—CFA) said he plans to present issues to address in the future.

Mr. Davis questioned whether the initial rescindment was made because of a desire to use price optimization. Ms. Leong said the actions were in no way due to a desire to do price optimization. She said the topic was never discussed by the Board in making its decisions. She said the rescindment action was taken to “clean up shop” because of the duplication with actuarial standards of practice (ASOPs). Mr. Hunter said the decision to rescind the SOP occurred at the same time as much debate on price optimization, and they seemed linked.

Birny Birnbaum (Center for Economic Justice—CEJ) suggested that the CAS reflect on the need for transparency and inclusion. He said CAS processes should be improved in relation to public policy and social issues. Ms. Smosna said Article 9 of the CAS’S constitution states that no opinion with respect to public interest shall be publicly expressed except in matters in the professional competence for actuaries, and only then with a two-thirds vote of the Board. Mr. Hunter said the CAS has begun to address some public issues. He said a paper was issued on rating factors, coauthored with the Insurance Information Institute (III), which was discussed for two years without anyone knowing. He said it was a biased and inaccurate statement, and it misconstrued his position on the impact of some rating variables on the poor.

The Task Force decided to take no immediate action to develop ratemaking principles. Mr. Vigliaturo said if members want to have the NAIC develop something in the future, suggestions should be submitted to NAIC staff.

Having no further business, the Casualty Actuarial and Statistical (C) Task Force adjourned.
Actuarial Opinion (C) Working Group
Virtual Meeting
July 22, 2021

The Actuarial Opinion (C) Working Group of the Casualty Actuarial and Statistical (C) Task Force met July 22, 2021. The following Working Group members participated: Anna Krylova, Chair (NM); Susan Andrews and Amy Waldbauer (CT); David Christhilf (DC); Judy Mottar (IL); Brock Bubar (ME); Gordon Hay (NE); Tom Botsko (OH); Andrew Schallhorn (OK); and James DiSanto (PA). Also participating were: Kevin Dyke (MI); and Arthur Schwartz (NC).

1. **Discussed SAO Instructions**

Ms. Krylova said two proposals were introduced during the Working Group’s July 1 meeting. One is to set a deadline for providing qualification documentation to the Board. The second is to require additional language that asserts the actuary’s compliance with respect to the qualification documentation provided to the Board. She said both changes would require changes to the Statement of Actuarial Opinion (SAO) instructions. She said the deadline to propose instruction changes for 2021 has passed, but the Working Group could propose these changes for 2022 instructions. Ms. Krylova said she will draft proposed instructions for the Working Group’s consideration.

Ms. Krylova said the Working Group previously discussed the Casualty Actuarial Society (CAS) Board’s rescission of its Statements of Principles and subsequent reinstatement of the Statement of Principles on Ratemaking with the caveat that it is for reference for U.S. regulated ratemaking. The SAO instructions mention the group of Statements of Principles, but the Statement of Principles on Reserving was not reinstated. Mr. Dyke said the SAO instructions also mention “principles” generally in another section, but he said he interprets that as referring to the CAS principles. The Working Group decided both should be removed. The Blanks (E) Working Group is expected to make these editorial changes for the 2021 instructions.

2. **Discussed Schedule P Reconciliation**

Ms. Krylova said the Working Group agreed during its July 1 meeting to add guidance about Schedule P reconciliation. Michelle Iarkowski (American Academy of Actuaries—Academy) said based on her reviews of reconciliations during regulatory financial examinations, she compiled the following issues: 1) a reconciliation showed data from the company’s systems reconciled to Schedule P, but there was no reconciliation of the data used for the actuarial analysis to Schedule P; 2) guidance is needed regarding whether the Schedule P reconciliation should be for direct and assumed or net of reinsurance amounts. Mr. Botsko said the choice of the reconciliation data (direct and assumed vs. net) could be left to the actuary, but state insurance regulators should require the actuary explain why he or she chose one over the other; 3) guidance is needed regarding the manner that loss adjustment expenses (LAEs) need to be reconciled. Adjusting and other (A&O) expenses are usually reconciled separately. Sometimes defense and cost containment (DCC) expenses are reconciled separately; 4) reconciliation for claim counts and earned premiums is optional, but there is no requirement to document why the reconciliation was not done. She said she has never seen a reconciliation for claim counts and suggests state insurance regulators consider removing reference to claims counts in the Regulatory Guidance on Property and Casualty Statutory Statements of Actuarial Opinion (Regulatory Guidance). Mr. Hay said he has never seen an actuary’s letter to the auditor saying claim counts were a material part of the actuarial review. Ralph Blanchard (Travelers) said flexibility is needed, so dictating a specific approach does not make sense. He said the claim counts were initially put into Schedule P so when a company needed to be taken over, the receiver would have an idea of the amount of claims handling needed. Mr. Schwartz agreed that claim count definitions vary by company and line of business, and he does not believe reconciliation would be useful; and 5) the actuary needs to explain “material” differences in the reconciliation, but there is no requirement to state that differences are deemed immaterial when the amount is more than rounding differences. Mr. Botsko said the word “material” is vague, and state insurance regulators might need to add clarity.

Ms. Iarkowski said the Regulatory Guidance could include these topics with an aim for the actuary to communicate that the data used is reconciled to Schedule P. She said a reconciliation of all data in total, all coverages and loss elements combined, does not give her confidence in the financial examination that the actuary used the correct data. Ms. Krylova said she would draft some language for the Regulatory Guidance to add clarity on the issues mentioned and remove the claim count reference in the Schedule P reconciliation section.
3. **Discussed Board Review of Qualification Documentation**

Ms. Krylova said Connecticut submitted some proposed language regarding review of actuarial qualification documentation. The proposed wording is: “If the Board of the holding company reviews the qualification documents of the appointed actuary who signs the opinion of all companies in a specific pool, the Board minutes of the statutory entity have to say that they reviewed that holding company’s assessment regarding the qualification documents and find it appropriate for their statutory entity.”

Mr. Blanchard said for Travelers, that means there would be 40 responses to say “yes.” He said he does not see a value with such a statement, and the holding company’s assessment should be sufficient. Ms. Andrews said the wording would address the need of a specific entity being reviewed in a financial analysis and would address corporate governance for an individual entity. Mr. Blanchard asked whether the holding company’s assessment could be reviewed instead because this just creates paperwork without additional value. Mr. Hay wondered if the holding company’s Board would provide such information to the pool or affiliates and said he does not believe he needs any prescribed language from the individual entity. He said he would review the pool as a statutory entity. Mr. Blanchard suggested the review should be conducted by who will receive the actuarial opinion and hear the report. Ms. Iarkowski said there are differences in practice and that she could not find guidance. Ms. Krylova said it would seem helpful to add some clarity to ensure fairness in financial exams.

Having no further business, the Actuarial Opinion (C) Working Group adjourned.

W:\National Meetings\2021\Summer\TF\CasAct\AOWG\7-22 AOWG min.docx
The Actuarial Opinion (C) Working Group of the Casualty Actuarial and Statistical (C) Task Force met July 1, 2021. The following Working Group members participated: Anna Krylova, Chair (NM); Miriam Fisk, Vice Chair (TX); Susan Andrews and Qing He (CT); David Christhilf (DC); Judy Mottar, Chantel Long, and Anthony Bredel (IL); Sandra Darby (ME); Gordon Hay (NE); Tom Botsko (OH); and Kevin Clark and James DiSanto (PA). Also participating was: Kevin Dyke (MI).

1. Discussed Reviews of 2020 SAO

The Working Group discussed financial reviews of insurance companies’ Statements of Actuarial Opinion (SAO). Mr. Botsko said he had more than the average number of newly appointed actuaries. He said the new actuaries complied with the requirements and wrote good opinions with one exception. Ms. Fisk said this is the first year for more specific attestation and that a handful of actuaries in Texas did not provide the correct attestation. Ms. Andrews said some did not correctly attest on the Casualty Actuarial Society (CAS) website to meet both general and specific qualification standards. Mr. Hay said he had two actuaries who used language to address submission of documents to the Board of Directors. He suggested improving the SAO instructions, but the Working Group noted that the opportunity to change 2022 instructions has passed. Ms. Krylova said more guidance could be added to the 2021 Regulatory Guidance on Property and Casualty Statutory Statements of Actuarial Opinion (Regulatory Guidance).

Michelle Iarkowski (American Academy of Actuaries—Academy) said there is no deadline for providing the qualification documentation, so one could issue the opinion without having completed the documentation and/or submitted the documentation to the Board. Some actuaries provide it to the Audit Committee in March or April after the opinion is issued. Ms. Andrews questioned whether the document should be delivered to the Board before an opinion is issued. Mr. Hay said the qualification documents do not have to be with the Board when the Board makes its decision about continued appointment of the appointed actuary. Ms. Andrews said new actuaries must submit the document before initially appointed, so the issue occurs only with renewals. Ms. Andrews said the Board’s governance responsibilities are to annually evaluate the qualifications of the appointed actuary. Mr. DiSanto said it gets complicated because in Pennsylvania, a Board is not required to reappoint an actuary each year; once appointed, the actuary remains until specifically unappointed. Mr. Dyke said it seems there are two separate issues: 1) whether the documentation is not being included in work papers; and 2) whether the Board is reviewing the documentation. Ms. Krylova said it seems there is consensus to consider setting a deadline for submission of qualification documentation to the Board. She said the Working Group would need to consider qualification standards allowing an actuary to document how continuing education (CE) will be completed by the end of March when writing the SAO.

2. Discussed Issues with Schedule P Reconciliation

Mr. Botsko said some opining actuaries did not follow the annual statement instructions about Schedule P reconciliation. For example, when pool percentages change, the actuary reconciled on a total basis versus by company by line. The actuary applied materiality for the reason to conduct the reconciliation on a total basis. Ms. Iarkowski said another reconciliation issue is some consulting actuaries have been reconciling to Schedule P based on the data provided to the actuary rather than the final actuarial exhibits. Mr. Hay said the actuary sometimes does not provide information such as who did the reconciliation and additional information. He has asked the actuary to be more specific, but the actuary has not done that. Mr. Dyke said some actuaries might be conflating the reliance on data requirement and the separate issue of Schedule P reconciliation. He said the Schedule P reconciliation is a higher bar. Ms. Andrews suggested the Working Group consider requiring documentation of who performed the Schedule P reconciliation. The Working Group agreed the problem is mostly a compliance issue, and they can consider additional guidance this year.

3. Discussed 2021 Regulatory Guidance

Ms. Krylova said the CAS Board rescinded its multiple Statements of Principles. The CAS Board subsequently decided to reinstate the Statement of Principles on Ratemaking with the caveat that it is for reference for U.S. regulated ratemaking. The SAO instructions mention the group of Statements of Principles. The Statement of Principles on Reserving was not reinstated. Ms. Krylova wondered if the caveat should be mentioned in the instructions even though it is a header and not part of the title. Mr. Dyke said the reason for reference to the Statements of Principles seems to be about the development of reserves using...
“accepted” principles. The Statement of Principles on Reserving was not reinstated. The Working Group might need to make revisions.

Ms. Iarkowski asked whether state insurance regulators want the qualification documentation submitted to all companies in a group that use one appointed actuary. Ms. Andrews said the state insurance regulators have to review the companies in their state. The companies in a group can be domiciled in different states. Mr. Blanchard said it would seem the Board of the holding company should be involved rather than the individual entities where the Boards can be made up of senior management. Ms. Andrews said the financial review process does not have the appointed actuary analysis at a group level. Ms. Iarkowski said guidance would be helpful.

Having no further business, the Actuarial Opinion (C) Working Group adjourned.

2021-11BWG (revised).doc
IDENTIFICATION OF ITEM(S) TO CHANGE

Add a new annual statement supplement to the Property and Casualty annual statement to capture “Direct Exposures Written” and “Direct Exposures Earned” which will be reported, initially only for Annual Statement Lines 4 (Homeowners), 19.1 (PPA No Fault), 19.2 (PPA Liability) and 21.1 (PPA Physical Damage).

Add one column to property casualty quarterly statement Part 1 Loss experience between current columns 1 and 2 for “Direct Exposures Earned” only for only for Lines 4 (Homeowners), 19.1 (PPA No Fault), 19.2 (PPA Liability) and 21.1 (PPA Physical Damage).

Add one column to property casualty quarterly statement Part 2 Direct Premium Written between current columns 1 and 2 for “Direct Exposures Written” only for only for Lines 4 (Homeowners), 19.1 (PPA No Fault), 19.2 (PPA Liability) and 21.1 (PPA Physical Damage).

Add instructions for reporting the additional data elements, consisting of definitions and examples for the new data elements.

REASON, JUSTIFICATION FOR AND/OR BENEFIT OF CHANGE**

The average written and average earned premium per exposure is an important metric for a variety of regulatory and public policy purposes. The NAIC annually produces reports of average personal auto and homeowners premiums, but the data in these reports are old and stale for timely assessment of absolute average premium and changes in average premium over time. Both reports are typically produced 24 months after the end of the experience period and 36 months after the beginning of the experience period. Homeowners average premiums for 2018 was published in January 2021 in the “Dwelling Fire, Homeowners Owner-Occupied, and Homeowners Tenant and Condominium/Cooperative Unit Owners’ Insurance Report: Data for 2018.” Personal auto average premiums for 2018 was published in March 2021 in the “Auto Database Report.” While there are valid reasons for the length of time needed to produce these reports – primarily because these reports contain information beyond average premium – the average premium numbers lose significant relevance because of their age.

This AS and QS Blanks proposals would allow the calculation of average written and average earned premium for residential property and personal auto coverages in a far more timely fashion – within three to four months following the reporting year instead of 24 months and would provide timely and useful quarterly information. The benefits of timelier average premium data are considerable. Timely average premium data would permit financial analysts to utilize changes in average premium as part of financial analysis. Similarly, the more-timely average premium data would become a valuable tool for market regulation analysts, including, but not limited to, an added data point for use with the Market Conduct Annual Statement. Last, but not least, this proposal would allow the NAIC to calculate and publish average annual premium data for residential property and personal auto insurance by state in a time frame to both make the data meaningful for describing market conditions and to inform individual state regulators and policymakers of actual changes in personal lines average premiums – as opposed to expected changes gleaned from rate filings.

Consider how valuable timely average premium values would have been for personal lines as the pandemic unfolded. Consider also the value of quarterly data for average premium for personal lines versus only an annual average. The lack of timeliness of the average premium values means that these data have very limited or no use for either financial or market analysis. The lack of timeliness also means that the data are no use in informing public policy debates about personal lines insurance costs. In addition, the severe time lag between actual experience and reporting fails to inform the public or policymakers of recent trends or outcomes and can, consequently, mislead the public and policymakers.
ANNUAL STATEMENT INSTRUCTIONS – PROPERTY

DIRECT PREMIUM AND EXPOSURES
Annual Statement Lines 2.5, 4, 19.1, 19.2 and 21.1
Allocated by States and Territories

This supplement must be filed with the NAIC by March 1 each year.

This supplement should be completed by those reporting entities that write direct business reported on the Exhibit of Premiums and Losses for each Annual Statement Lines (ASL) listed below. A separate page will be completed for each ASL.

ASL 4 (Homeowners)
- Excluding Renters, Condominiums and Co-ops
- Renters, Condominiums and Co-ops

ASL 19.1 (Private Passenger Auto No-Fault – Personal Injury Protection)

ASL 19.2 (Other Private Passenger Auto Liability)

ASL 21.1 (Private Passenger Auto Physical Damage)

Column 1 – Direct Premiums Written

The amounts reported for each line should agree with the amounts reported for the corresponding Annual Statement Line in Column 1, Line 35 of the Exhibit of Premiums and Losses for that state.

- Line 59 (Part 1 plus Part 2) should equal Line 4, Column 1, Line 35 of the Exhibit of Premiums and Losses (GT Page)
- Line 59 (Part 3) should equal Line 19.1, Column 1, Line 35 of the Exhibit of Premiums and Losses (GT Page)
- Line 59 (Part 4) should equal Line 19.2, Column 1, Line 35 of the Exhibit of Premiums and Losses (GT Page)
- Line 59 (Part 5) should equal Line 21.1, Column 1, Line 35 of the Exhibit of Premiums and Losses (GT Page)

Column 2 – Direct Written Exposures

A Written Exposure for Annual Statement Lines 4 is defined as a single residential property for which coverage was written at any time during the calendar reporting period and remained in force through the end of the calendar reporting year. If the coverage was written and cancelled within the calendar reporting year, the written exposure is the fraction of the year the coverage was in force.

A Written exposure for Annual Statement Lines 19.1, 19.2 and 21.1 is defined as single motor vehicle for which coverage was written at any time during the calendar reporting year and remained in force through the end of the calendar reporting year. If the coverage was written and cancelled within the calendar reporting year, the written exposure is the fraction of the year the coverage was in force.
Examples. Assume a homeowners policy is written on July 1 during the reporting year and remains in force through the end of the reporting year. This activity would be reported as one (1.0) written exposure.

Assume a private passenger policy with No-Fault, Liability and Physical Damage coverages was written on April 1 and cancelled by the insured on July 1. This activity would be reported as 0.25 written exposure.

Column 3 – Direct Premiums Earned

The amounts reported for each line should agree with the amounts reported for the corresponding Annual Statement Line in Column 2, Line 35 of the Exhibit of Premiums and Losses for each state.

Line 59 (Part 1 plus Part 2) should equal Line 4, Column 2, Line 35 of the Exhibit of Premiums and Losses (GT Page)

Line 59 (Part 3) should equal Line 19.1, Column 2, Line 35 of the Exhibit of Premiums and Losses (GT Page)

Line 59 (Part 4) should equal Line 19.2, Column 2, Line 35 of the Exhibit of Premiums and Losses (GT Page)

Line 59 (Part 5) should equal Line 21.1, Column 2, Line 35 of the Exhibit of Premiums and Losses (GT Page)

Column 4 – Direct Earned Exposures

An Earned Exposure for Annual Statement Lines 4 is defined as the fraction of the calendar reporting year for which a single residential property had coverage in force.

An Earned Exposure for Annual Statement Lines 19.1, 19.2 and 21.2 is defined as the fraction of the calendar reporting year for which a single motor vehicle had coverage in force.

Examples. Assume a homeowners policy is written on July 1 during the reporting year and remains in force through the end of the reporting year. This activity would be reported as 0.5 earned exposure.

Assume a private passenger policy with No-Fault, Liability and Physical Damage coverages was written on April 1 and cancelled by the insured on July 1. This activity would be reported as 0.25 earned exposure.

### SUPPLEMENTAL EXHIBITS AND SCHEDULES INTERROGATORIES

The following supplemental reports are required to be filed as part of your statement filing unless specifically waived by the domiciliary state. However, in the event that your domiciliary state waives the filing requirement, your response of WAIVED to the specific interrogatory will be accepted in lieu of filing a “NONE” report and a bar code will be printed below. If the supplement is required of your company but is not being filed for whatever reason, enter SEE EXPLANATION and provide an explanation following the interrogatory questions.

#### MARCH FILING

1. Will an actuarial opinion be filed by March 1?

2. Will the Supplemental Compensation Exhibit be filed with the state of domicile by March 1?

3. Will the confidential Risk-based Capital Report be filed with the NAIC by March 1?

4. Will the confidential Risk-based Capital Report be filed with the state of domicile, if required, by March 1?

#### APRIL FILING

5. Will the Insurance Expense Exhibit be filed with the state of domicile and the NAIC by April 1?

6. Will Management’s Discussion and Analysis be filed by April 1?

7. Will the Supplemental Investment Risks Interrogatories be filed by April 1?

#### MAY FILING

8. Will this company be included in a combined annual statement that is filed with the NAIC by May 1?

#### JUNE FILING

9. Will an audited financial report be filed by June 1?

10. Will Accountants Letter of Qualifications be filed with the state of domicile and electronically with the NAIC by June 1?

#### MAY FILING

11. Will the Reinsurance Summary Supplemental Filing for General Interrogatory 9 be filed with the state of domicile and the NAIC by March 1?

12. Will the Medicare Supplement Insurance Experience Exhibit be filed with the state of domicile and the NAIC by March 1?

13. Will the Trusteed Surplus Statement be filed with the state of domicile and the NAIC by March 1?

14. Will the Reinsurance Attestation Supplement be filed with the state of domicile and the NAIC by March 1?

15. Will an approval from the reporting entity’s state of domicile for relief related to the Requirements for Audit Committees be filed electronically with the NAIC by March 1?

16. Will the Direct Premium and Exposures Supplement be filed with the NAIC by March 1?

#### JUNE FILING

17. Will the Trusteed Surplus Statement be filed with the state of domicile and the NAIC by March 1?

18. Will the Medicare Part D Coverage Supplement be filed with the state of domicile and the NAIC by March 1?

19. Will the confidential Actuarial Opinion Summary be filed with the state of domicile, if required, by March 15 (or the date otherwise specified)?

20. Will the Reinsurance Attestation Supplement be filed with the state of domicile and the NAIC by March 1?

21. Will the Reinsurance Attestation Supplement be filed with the state of domicile and the NAIC by March 1?

22. Will the Bond Supplement be filed with the state of domicile and the NAIC by March 1?

23. Will the Director and Officer Insurance Coverage Supplement be filed with the state of domicile and the NAIC by March 1?

24. Will an approval from the reporting entity’s state of domicile for relief related to the five-year rotation requirement for lead audit partner be filed electronically with the NAIC by March 1?

25. Will an approval from the reporting entity’s state of domicile for relief related to the one-year cooling off period for independent CPA be filed electronically with the NAIC by March 1?

26. Will an approval from the reporting entity’s state of domicile for relief related to the Requirements for Audit Committees be filed electronically with the NAIC by March 1?

27. Will the Direct Premium and Exposures Supplement be filed with the NAIC by March 1?

#### AUGUST FILING

28. Will the Credit Insurance Experience Exhibit be filed with the state of domicile and the NAIC by April 1?

29. Will the Long-term Care Experience Reporting Forms be filed with the state of domicile and the NAIC by April 1?

30. Will the Accident and Health Policy Experience Exhibit be filed by April 1?

31. Will the Supplemental Health Care Exhibit (Parts 1, 2 and 3) be filed with the state of domicile and the NAIC by April 1?

32. Will the regulator-only (non-public) Supplemental Health Care Exhibit’s Allocation Report be filed with the state of domicile and the NAIC by April 1?

33. Will the Cybersecurity and Identity Theft Insurance Coverage Supplement be filed with the state of domicile and the NAIC by April 1?

34. Will the Life, Health & Annuity Guaranty Association Assessable Premium Exhibit – Parts 1 and 2 be filed with the state of domicile and the NAIC by April 1?

35. Will the Private Flood Insurance Supplement be filed with the state of domicile and the NAIC by April 1?

#### EXPLANATION:

If the supplement is required of your company but is not being filed for whatever reason, enter SEE EXPLANATION and provide an explanation following the interrogatory questions.

Highlights of Recent Research Reports

- **Business Interruption Insurance Compendium**
  - Released May 2021
  - [https://www.soa.org/resources/research-reports/2021/business-interruption-insurance/](https://www.soa.org/resources/research-reports/2021/business-interruption-insurance/)
  - Includes articles, papers, program proposals and legislative notes that provide insight into Business Interruption Insurance and the effects of the coronavirus (COVID-19) pandemic on its current and future state of coverage.

- **Actuarial Weather Extremes**
  - Monthly reports that identifies and examines unusual or extreme single-day or multi-day weather events across North America
  - [https://www.soa.org/resources/research-reports/2019/weather-extremes/](https://www.soa.org/resources/research-reports/2019/weather-extremes/)
  - Special Report on Hurricane Elsa, July 5 - 11

- New Education Offering

- Launch of “Ethical and Responsible Use of Data and Predictive Models” Certificate Program
- Website launching later this week: [www.soa.org/ERUcert](http://www.soa.org/ERUcert)
Figure 2
Total Rainfall Produced by Hurricane Elsa, Ranked Against Historical Data (source: GHCN data)
As the insurance industry works more with big data, artificial intelligence (AI) and predictive analytics, there is a new set of ethical questions to consider. The potential for more decision-making to be in the control of algorithms raises significant new risks to the insurance profession and adds complexity for regulators.

It is important for actuaries, data scientists, regulators and others who work in the insurance industry, to understand ethical and responsible data use and model construction guidelines. These guidelines will provide greater assurance that appropriate procedures are used for data acquisition and manipulation, and also for the building, use and maintenance of predictive models.

The Society of Actuaries (SOA) is deeply committed to the importance of responsible data usage and has created a first-of-its-kind Ethical and Responsible Use of Data and Predictive Models Certificate Program.

Participants should expect an extremely comprehensive and rigorous curriculum where they will learn about ethical and responsible data usage through seven self-guided modules, three instructor-led webinars, and a graded, take-home final assessment. Upon passing the final assessment, participants will receive a certificate recognizing their expertise in the Ethical and Responsible Use of Data and Predictive Models from the SOA.

This course does not assume a knowledge of predictive analytics in particular but does assume a familiarity with financial modeling and working with actuarial data.

**PARTICIPANT PROFILES**

- Actuaries working with big data, AI, and machine learning, and those who are responsible for signing off on model results and for communicating to the C-suite and to regulators
- Data scientists and other professionals working with big data, AI and machine learning models in insurance

**BENEFITS OF THE CERTIFICATE**

- Allows the bearer of the certificate to show that as a data-ethics trained individual, their filing work carries a certain level of assurance that they are following an ethical framework
- Helps ensure actuarial teams and data teams are speaking the same language and operating under the same umbrella of best practices
- Provides assurance for regulators that the individual has a deep understanding of ethical issues and how market and regulatory context affects models
- Helps to mitigate risks associated with the many ethical questions the industry is facing with big data on the frontier of actuarial science
- Offers a framework with ethical criteria to consider when working with predictive models and algorithms
- Provides practical instruction, soft skills integration, and a level of rigor consistent with current SOA credentials

© 2021 National Association of Insurance Commissioners
The Surplus Lines (C) Task Force met Aug. 5, 2021. The following Task Force members participated: James J. Donelon, Chair, Stewart Guerin and Tom Travis (LA); Larry D. Deiter, Vice Chair (SD); Ricardo Lara represented by Kim Hudson (CA); Michael Conway represented by Rolf Kaumann (CO); David Altmaier represented by Virginia Christy (FL); Colin M. Hayashida represented by Martha Im (HI); Dean L. Cameron represented by Randy Pipal (ID); Dana Popish Severinghaus represented by Marcy Savage (IL); Troy Downing (MT); Russell Toal (NM); Mike Causey represented by Fred Fuller (NC); Glen Mulready represented by Eli Snowbarger (OK); Jessica K. Altman represented by David Buono (PA); Doug Slape represented by Jamie Walker (TX); Mike Kreidler represented by Jeff Rude (WY).

1. **Adopted its 2020 Fall National Meeting Minutes**

   Mr. Baughman made a motion, seconded by Superintendent Toal, to adopt the Task Force’s Nov. 18, 2020, minutes. The motion passed unanimously.

2. **Adopted its 2022 Proposed Charges**

   Commissioner Donelon stated that the 2022 proposed charges (Attachment One) for the Task Force and Surplus Lines (C) Working Group did not contain any changes compared to the 2021 charges.

   Mr. Kaumann made a motion, seconded by Superintendent Toal, to adopt the Task Force’s 2022 proposed charges. The motion passed unanimously.

3. **Adopted the Report of the Surplus Lines (C) Working Group**

   Mr. Guerin reported that since 2020 the Fall National Meeting, the Surplus Lines (C) Working Group met June 21 and March 2 in regulator-to-regulator session, pursuant to paragraph 3 (specific companies, entities or individuals) of the NAIC Policy Statement on Open Meetings. He indicated that during these meetings, the Working Group discussed four applications seeking approval for listing on the NAIC Quarterly Listing of Alien Insurers, and all four of the applications were approved. Mr. Guerin stated that the Working Group also met July 7 (Attachment Two) to address two administrative tasks. He stated that the Working Group discussed amendments to the NAIC Standard Form - Trust Agreement for Alien Excess or Surplus Lines Insurers and proposed modifications to the NAIC Quarterly Listing of Alien Insurers. Mr. Guerin stated that the Working Group exposed these draft documents for a 30-day public comment period ending Aug. 6.

   Mr. Kaumann made a motion, seconded by Mr. Baughman, to adopt the report of the Surplus Lines (C) Working Group. The motion passed unanimously.

4. **Discussed the Formation of a Drafting Group to Amend Model #870**
